One regrets that after all arrangements had been made there was no time to visit the W.R.A.F.'s hostel, particularly as the W.R.A.F.s are leaving Lee shortly. But when trains are one an hour, and there is a dinner at the other end of a long journey, one is not running any risks.

The day on which the visit to Calshot was made was quite a good one on which to travel to the ends of the earth. The steamer from Portsmouth to Southampton conveys one to Calshot, where it is met by an R.A.F. launch, which takes one ashore. Even then there is a drive of some ten minutes before one reaches Top Camp.

Top Camp consists of living quarters for the personnel, a recreation ground, canteens, etc. Everywhere was deserted, of course, but very clean. Calshot is a busy station.

On the Spit, where everybody seemed to be, one saw workshops and power station, sheds full of F. boats and Short folders, etc.—and everywhere men at work.

The station, being a permanent one, is being enlarged in order to accommodate a larger personnel. During the war this station, which had a personnel of something like a thousand, had accommodation for two hundred, and Peace, coming as it did when all were unprepared for it, discovered the station in the process of the alterations which are now approaching completion.

There is a vast deal more to be seen at Calshot than at Lee-on-the-Solent; therefore one's apologies for the incoherence of this article are necessary; but when one crowds into an afternoon sufficient impressions to last one several days the result is naturally some chaos of thought.

The visit came to an end with the signalling of the Cowes boat, and one re-embarked on the launch and at length arrived aboard the steamer.

The chief thing about Calshot is its absolute "ungetatableness." In the summer it might possibly be bearable, but in winter it must be ghastly. Certainly one realises the need of a cinema and a theatre, for the only connection with the outer world seems to be the launch and the Southampton-Portsmouth boat.

At any rate, one spent two pleasant afternoons among people who did not find it too much trouble to be nice.—

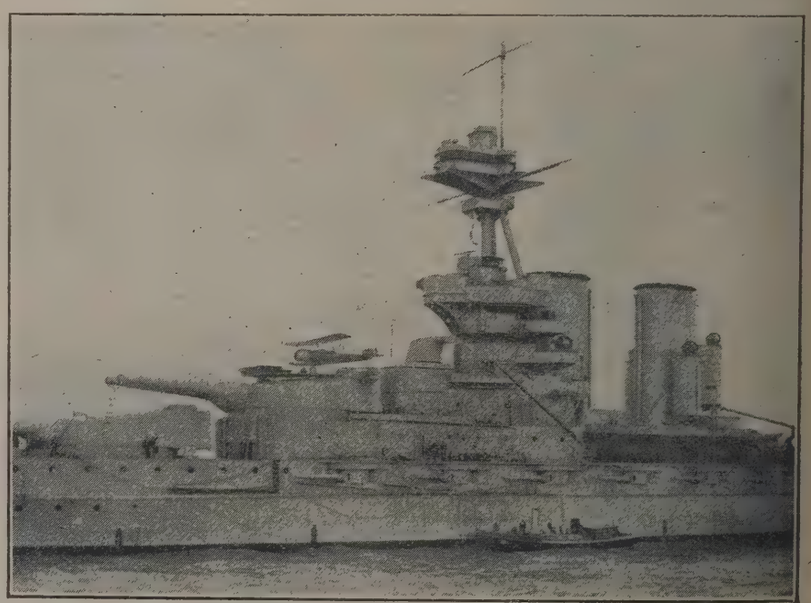
S. F. B.

A Gift for the R.A.F.

Vice Air-Marshal Sir Godfrey Paine, Inspector-General, Royal Air Force, opened at Netheravon an institute which has been presented to the Royal Air Force by the Church of England Board for the welfare of the Imperial Forces in the diocese of Salisbury.

Sir Godfrey emphasised the fact that it was the first institute presented by anybody to the Royal Air Force. There might be bigger institutes, but he knew of none that was so comfortable and well equipped, and the gratitude of the whole of the Royal Air Force was due to the Church of England Board for its munificent gift.

The institute, which has been erected at a cost of £4,000, has accommodation for 600 persons, comprises a lounge hall, billiard room, buffet, and a chapel or devotional room, the last-mentioned being formally dedicated by the Bishop of Salisbury, who presided at the opening function.



AUSTRIA.

The Italian correspondent of The Aeroplane writes :—

"Il Cielo" publishes the following, which is taken from an official Austrian report on Austro-Hungarian Military aviation :

When the armistice was signed the Austrian Air Force was testing the following machines as to their war efficiency :—

The "Bergmann K," or "Kampfdoppeldekker," built by the

A Sopwith 1½-strutter (130 h.p. Clerget engine) above the 15-in. guns of H.M.S. "Queen Elizabeth."

VICKERS LIMITED

THE TRANSATLANTIC FLIGHT

"VICKERS - VIMY - ROLLS"

The first direct Flight from Newfoundland to Ireland 1,900 miles) was accomplished by this Aeroplane in 15 hrs 57 mins. 4 tons of Petrol and Oil were used.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Austrian Flugzeug-Fabrik, which machine had given the very best results.

The "Phönix" two-seater, doing 195 kil. per hr., with a ceiling of 7,000 metres.

A later type "Phönix" "hunter" with a 300-h.p. motor, smaller dimensions and greater speed.

The "Bergkampflugzeug" built by the Aviatic Co. and intended for "hunting" over mountain ranges. This craft had a Hiero motor, could leave the ground in 60 metres, and excelled in evoluting.

The "Ago" bombardment triplane—less speedy than the biplane of that name, much more stable, and obviously a better weight carrier.

Though the official results of its tests were not made public, it appears that the machine satisfied neither the hopes of its designers nor the demands of the pilots at the front.

The "Mises," a Caproni type with two Austro-Daimler 300 h.p. motors and a span of 18 metres. It was intended to carry a crew of six and did so on its trial flight till it crashed, killing them all.

Of the five numbers painted on all Austro-Hungarian war machines the first group of two stood for the factory number and the series, the second group for the machine's individual number in the series. Low factory and series numbers were existing evidently, neither running into double figures. The nine factories were numbered as given lower down. Machines contracted out apparently bore the designer-firm's number. So the big "Skoda" firm engaged on building "Albatros" and a "Spad" type seems to have had no distinguishing number allotted to its productions for this reason.

Of motors, the Hiero 240, the Hirla 160 and 240, the Vienna "Fiat" 200, the Benz and Austro-Daimler seem to have been most favoured.

AUSTRIAN FACTORY NUMBERS.

Löhner Werke, No. 1; Albatros Werke, No. 2, at Stadlau; Aviatik, No. 3, at Vienna; Lloyd Werke, No. 4, of Colmar; Ofbag, No. 5 (Osterreicher Flugzeugfabrik A-G); Uffag, No. 6 (Ungarisce Hugzeugfabrik A-G); Fischamend Werke, No. 7; Wienerkarosserie, No. 8; Thöme-Fiala, No. 9, of Vienna.—T.S.H.

FRANCE.

FALSE REPRESENTATION.

A M. Alain Barbier du Doré was arrested recently on a charge of wearing an army captain's uniform decorated with the Legion d'Honneur and the Croix de Guerre with seventeen palms. He had attempted to obtain credit financially and morally as Captain Heurteaux. He has instead been sentenced to eight days' imprisonment.

A PARIS-CONSTANTINOPLE FLIGHT.

Capt. Lenne, accompanied by a Greek military aviator and a mechanic, Perrin, reached Constantinople on Sept. 12th, after a flight from Paris, via Rome. No details as to the time taken up on the journey, or of the landings made, are available. They crossed the Albanian Mountains through a violent storm.

THE FRENCH UNIFORM.

The form of the uniform of French troops has now been laid down definitely. The red breeches disappear and troops of all arms, save the Chasseurs and the African and Colonial formations, will in future wear the sky blue kit which was introduced early in the late war. The Chasseurs will continue to wear their old uniforms and the African and Colonial troops will be put into khaki.

The képi, alone of all pre-war kit, is retained. Officers and men are given two years in which to wear out their present uniforms.

GERMANY.

The Danish correspondent of THE AEROPLANE writes :—

A German seaplane tender to the mine-sweeper flotilla operating in the North Sea, off Esbjerg, supplied a proof of utility aviation the other day, when it turned up in the harbour to order some pastry for a feast of the lickerish commanders, bringing them safely to their destination upon completion.

ITALY.

The "Corriere della Sera" says that a squadron of aeroplanes, which deserted from Ajello has arrived at Fiume.

RUSSIA.

OFFICIAL COMMUNIQUÉS (BOLSHEVIK).

Sept. 16th.—Enemy aeroplanes carried out a raid on Kronstadt, dropping bombs.

Sept. 19th.—Enemy aeroplanes appeared over Kronstadt at 4.30 a.m. on Sept. 18th and dropped four incendiary bombs. An empty wooden barn caught fire through one of them exploding. We brought down one of the enemy aeroplanes on its return journey. The aeroplane was of the type Ilia Murometz, and came down near one of our forts. The aviator was drowned.

[Presumably "Ilia Murometz" (which was the name of the Sikorski biplane) merely means a big aeroplane of some sort. Slav veracity is a negligible quantity, so the communiqué does not impress anybody.—ED.]

Sept. 20th.—Near Kronstadt we have brought down an enemy aeroplane.

BOLSHEVIK EQUIPMENT.

The first junction between the armies of the Polish General Pilsudski and the Russian General Denikin was made recently by a Polish aviator, one, Lieut. Weber, attached to the French aviation squadron which is serving in Poland. Lieut. Weber landed at Kieff on Sept. 13th, carrying as passenger the "Morning Post" special correspondent, who writes :—

General Kamenieff, of the former Russian Command, who directed the Bolshevist operations, and probably had fifty thousand men with perhaps 250 guns at his disposal for the defence of the city, also managed to get into action a greater number of technical appliances, such as armoured motor cars, aeroplanes, and the like, than Denikin's army ever encountered before.

SPAIN.

An aeroplane flying at a great height over the aerodrome at Madrid on Sept. 19th fell to the ground, the pilot, Capt. Rocha, and a passenger, Capt. Navarro, were killed.

SWEDEN.

The Swedish Army aviator, Rodehn, established a Scandinavian record on Sept. 21st by flying the whole length of Sweden from Ystad to Haparanda and thence to Boden, a distance of 1,420 kilometres, in seven and a half hours, without landing. Rodehn used a 260-h.p. Swedish aeroplane.

U.S.A.

THE DEMOBILISATION OF AIR SERVICE OFFICERS.

The following table shows the number of officers demobilised between Nov. 11th, 1918, and Aug. 20th, 1919, and the number still retained on the strength :—

BRANCH OF SERVICE.	On strength 11th November, 1918.	Demobilised by August 20th, 1919.	Percentage Demobilised.
Aircraft Production ...	1,870	1,505	80
Military Aeronautics	19,378	15,287	79

THE AIR SERVICE UNITS ON THE MEXICAN BORDER.

The Mexican border is still a source of trouble to the United States Government and a large number of troops is stationed over that area. There is little actual fighting, but the threat is constant.

Nine squadrons in all are allocated for duties along the border and are distributed as follows : the 9th and 91st Observation Squadrons are based on Rockwell Field, and the 8th, 90th, and 104th Squadrons of the Surveillance Group with the 11th, 20th, 96th and 166th Squadrons of the Bombardment Group are to take station along the eastern stretches of the border. The First Pursuit Group from Selfridge Field is also under orders for the border, where it will be employed as tactical conditions dictate.

The disposition of flying units on the border during the early part of the present month is shown in the following table :—

Unit.	Station.	Strength in Aeroplanes.	Aeroplanes fit for S'rvice	Pilots	Observers
9th Squadron	San Diego	18	14	30	—
11th Squadron					
A Flight	Marfa	6	6	9	2
B Flight	El Paso	14	7	16	2
96th Squadron					
A Flight	Douglas	4	3	8	0
B Flight	El Paso	13	7	8	1
8th Squadron					
A Flight	MacAllen	8	4	9	8
B Flight	Laredo	6	6	5	5
		69	47	85	18

Aviators and mechanics who have served overseas are daily being drafted to border units that their experience may assist the general progress of military operations.

These units are working daily in close liaison with other arms of the Service and considerable progress in training is being made. Maps of the district are inaccurate and incomplete and the flying units are assisting in a new survey of the area.

An Aviation General Supply Depôt at San Antonio is at present engaged equipping aeroplanes with Lewis and Marlin machine guns. Three hundred and forty mountings for Lewis guns and five hundred locks for Marlin guns were expected during the present month.

MUSIC AND THE R.A.F.

Major Geoffrey Toye, late R.A.F., is to conduct the Gilbert and Sullivan operas which are to be revived in London shortly. Major Toye was very successful at the Philharmonic concerts last season.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

The proposal to form an Institute of Aeronautical Engineers and the suggestion that this Institute should also act as a professional Trades Union for its members have drawn from Capt. Sayers a lengthy essay on the subject.

He examines some of the numerous difficulties and dangers which will beset the path of such a body, and arrives at the general conclusion that the educated classes of workers must seek for some form of organisation which will adequately represent their interests if they wish to maintain their present position.

Some of the more recent designs due to the famous firm of Short Bros., Ltd., form the subject of this week's instalment of "Modern British Aeroplanes."

Two interesting types of German aeroplanes are described and illustrated in this issue.

One, the Linke-Hoffmann, multiple-engined type is a war-time product.

The other, the Hannover Triplane Limousine, is a commercial passenger-carrier of the most recent type.

A summary of that part of Sir Charles Parsons' presidential address to the British Association which refers to Aeronautics will be found on page 1183.

THE INSTITUTE OF AERONAUTICAL ENGINEERS AND PROFESSIONAL TRADES UNIONISM.

By Capt. W. H. SAYERS, Late R.A.F.

The proposal put forward some weeks ago by Mr. R. W. D. Shaw for the formation of an Institute of Aeronautical Engineers has raised for discussion a number of points of very great importance to the profession concerned.

It may be recalled that Mr. Shaw's original proposal was that an association be formed from among those engaged in the technical branches of the Aircraft Industry, membership whereof shall only be gained on passing an examination sufficient to exclude any but properly qualified technicians, and that the Institution should aim at giving to its members a professional status which would be recognised in the aeronautical world, just as the status of a member of the Institute of Civil Engineers is recognised in the engineering world generally.

To this original suggestion there can be no serious objection in principle.

Practical Difficulties.

In practice there are certain difficulties. General experience shows that examinations are usually second only to statistics in the misleading nature of the conclusions to which they give rise. Thus there are many who could pass successfully the qualifying examinations for the Institute of Civil Engineers whose practical value as engineers might be inferior to that of the average bricklayer.

Nevertheless, a certain minimum standard of technical education can quite properly be demanded from anyone who aspires to be known as a member of the engineering profession, and provided that examinations can be kept out of the control of that mystery-mongering class who acquire their living by professing rather than by practising, they are probably the most satisfactory method of securing that such a standard is maintained.

The alternative method of requiring a candidate to submit particulars of his own qualifications to the committee of the association, who thereon decide as to his fitness, or otherwise, has—in theory—certain advantages. It has the disadvantage that it is practically impossible to establish a definite qualification standard, and that the quality of those admitted to membership is apt to vary very considerably with changes in the personnel of the committee. This is very likely to occur in either case. Thus an old-established institution always tends to exclude from amongst its members those who show in their examinations signs of having absorbed new and more or less heterodox ideas, and so such societies have in more than one instance tended to discourage rather than to encourage the growth of knowledge.

A Forcible Objection.

In this particular case the proposal to form an association which will guarantee the possession of proper professional qualifications has drawn from Mr. A. E. Berriman a rather lengthy and forcible expression of disapproval.

Mr. Berriman suggests that the title of "The Institute of Aeronautical Engineers" in some sense implies that it is intended to usurp the functions of the Royal Aeronautical Society, and that this is further accentuated by the proposal to call upon candidates for membership to show some measure of technical qualification, since that requirement is also made by the R.Ae.S. before admission to the Society as an Associate Fellow or a Fellow.

This appears to be a somewhat far-fetched objection. There is a very considerable distinction between the functions of such an association as the Royal Aeronautical Society, which naturally has amongst its members many aeronautical engineers and those of an Insti-

tution of Aeronautical Engineers. The one is, or should be, an association of those in any way interested in the science of aeronautics for the spread of the knowledge of that science.

An Institute of Aeronautical Engineers should be—by analogy with other Institutions of Engineers of one kind or another—an association of professional men for the furtherance of their efficiency in that profession.

A mathematician—such as Professor Bryan, for instance—who has by his work made an appreciable contribution to the theory of any branch of aeronautical science may quite properly be a Fellow of the Royal Aeronautical Society, solely on the ground that that contribution is evidence of his qualifications as an aeronautical scientist.

That achievement by itself could not properly qualify Professor Bryan as an aeronautical engineer, though it might properly be recognised by an Institute of Aeronautical Engineers by making Professor Bryan an honorary member.

Inversely, the managing engineer of a factory engaged solely upon the production of standard aircraft of proved types would, on his engineering qualifications and the nature of the work upon which he was employed, be a fit and proper person to become a member of an Institution of Aeronautical Engineers.

He might quite conceivably possess no knowledge of aeronautical science which would justify his election as a Fellow or Associate Fellow of the Royal Aeronautical Society.

The two bodies will necessarily overlap to some extent in their activities; if they are both intelligently directed, they should often co-operate; and if in effect they do compete in certain spheres, this should stimulate both.

A Complication.

So far, there is little room for serious adverse criticism of the scheme, but the situation has been very considerably complicated by a proposal—due to Mr. L. Howard Flanders—that the Institution should also be a Defence Union for its members, and should be registered under the Trades Unions Act.

Proposals for the formation of Trades Unions for technical and professional workers are by no means new. In the engineering world they have been made at intervals for the past twenty years or so, with no appreciable result up to the present. There does exist a Society of Technical Engineers which has been registered under the Trades Unions Act, and which has, it is believed, a membership of over 20,000. This particular body is of such recent growth that it can scarcely yet be described as an effective force.

With this one exception, all such attempts have failed because technical men have fought shy of the idea of becoming Trades Unionists.

To some extent this has been due to a feeling that by so doing they would declass themselves.

Others have feared the enmity of their employers to such a movement, and still more have felt that Trades Unionism means inevitably some limitation to the liberty of the subject and might hamper their freedom to make for themselves the best terms when marketing their abilities.

A Fact To Be Faced.

However, to-day the technical and professional man is faced by the fact that the manual workers of all types and all nations have banded themselves together into associations so powerful that these bodies have attained throughout the civilised world a legally recognised status, and that through these bodies the working classes do possess enormous political and economic power.

Under the Trades Unions Act the workers' organisations are empowered to act in a manner which would bring any body not registered as a Union into the civil courts upon a charge of illegal conspiracy.

There are not wanting signs that the extra-legal powers of these bodies will, when a fitting occasion arises, be used remorselessly in the interests of the classes which they represent, and with very little consideration for the just claims of the unorganised brain-workers of the world.

It is useless to decry Trades Unionism on this account.

The Trades Union movement is—in theory, at least—unassailable. It is impossible in any highly organised modern community for a single individual with a grievance against the community in general to secure a perfectly just rectification of that grievance. It is impossible because the conditions of life are so complicated and the individual circumstances are so various that perfect justice to one may involve a positive injustice to another.

Therefore the governing body of any community can do no more than try to establish a code which shall do approximate justice under average conditions to the majority of the citizens.

The Practical Value of Trades Unions.

It is obviously easier to determine what is approximately just and what is not when that community is organised into a series of bodies, each speaking with one voice, and each representing the general opinion of its members as to their most acute grievances, than when it consists of an entirely unorganised crowd, each member of which is engaged in incoherently squealing over his personal grievance.

Let it be granted that the Trades Union movement as it exists to-day has many bad features, and that it threatens great evils to the State.

Any great organisation, representing a sectional interest alone, whether the interest be that of shopkeepers, newspaper proprietors, automobile manufacturers, or dog fanciers, would threaten equal evil had they the same clear field as the Trades Unions now possess.

Such a sectional organisation is a perfectly legitimate political weapon; it can properly be met by those whom it threatens with a similar sectional organisation of their own.

If the Trades Unions of the manual workers are left with a clear field and with no competition—beyond the general opposition of a disorganised mob provided with no settled programme and no generally agreed policy—they are fairly entitled to any victories that they may gain, and the so-called brain-workers can only blame their own stupidity if they suffer from their own lack of organisation.

The Futility of Mere Grumbling.

Therefore it seems fairly clear that any profession which contents itself with ineffective grumblings against the delinquencies of the Trades Unions, and which refuses to organise itself into an association armed with substantially the same powers as those possessed by those Unions, will have only itself to blame if it is overwhelmed by the interests of those who have shown themselves possessed of more common sense than they.

Mr. Flanders' proposal that the Institute of Aeronautical Engineers should become in effect a Trades Union, therefore, must not be defeated by any feelings of mere snobbery, or by the fear that such a body may interfere to some extent with individual liberty of action.

If the association is to be a success, it must so interfere.

Organisation of any sort is impossible without discipline, and discipline implies some sacrifice on the part of the individual for the sake of the whole body.

At the same time the actual details of the scheme will require very careful consideration.

No Trades Union or similar body can nowadays con-

WESTLAND

The Westland "LIMOUSINE"

with the "Rolls-Royce" engine. This is not a converted war machine, but has been designed and built for high-class public passenger service or for the convenience of the private owner.

It combines the speed of an aeroplane with the comfort of a Limousine.

For full particulars and arrangements as to trial flights apply to our London Representative **Lieut.-Colonel C. H. MEARES**, HOTEL REGINA, 17, SOUTHWELL GARDENS, LONDON, S.W.7.

WESTLAND AIRCRAFT WORKS

AIRCRAFT, YEOVIL.

cern itself solely with the internal politics of the trade which it represents.

It is bound to be to some extent concerned with general political affairs which directly or indirectly may have an effect on the trade or profession with which it is associated.

Thus any Trades Union offers itself as a possible field for the purely political agitator, and many Trades Unions to-day are found to be under the control of those who have little or no real interest in the industry they are supposed to represent, and who are solely concerned with it as a source of political power.

It is probably impossible to frame the constitution of the body in such a way as entirely to prevent this state of affairs, but every care should be taken to make it as improbable as possible.

A provision that a necessary qualification for a seat on the council or managing committee be the earning of one's bread-and-butter by the practice of the profession would assist and would also aid in keeping the control of the Institute out of the hands of retired and eminent fossils.

A Serious Objection.

The most serious objection to the proposed Trades Union, however, is the very limited class to which membership would appear to be open.

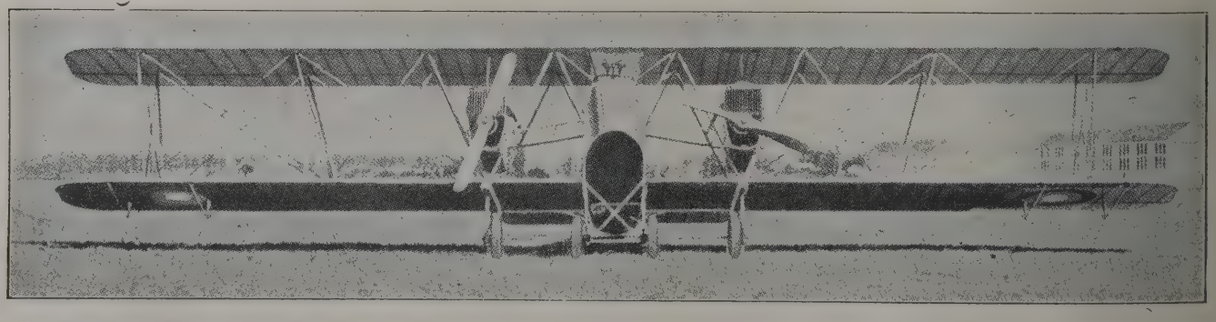
It is one of the most objectionable features of Trades Unionism as it now exists that it is divided up into a series of small sectional associations, and has tended to encourage the idea that once a man has become a carpenter, or a bricklayer, or anything else, that he must necessarily always remain so.

Thus the mining of coal, as it is now practised, is no fit occupation for a decent human being. Therefore there exists a natural tendency for the more intelligent and progressive of those engaged in that trade to forsake it for others offering better conditions. This would naturally lead to a falling off in coal production, and would force mine-owners to improve the methods employed in gaining coal till it permitted the miners to live on terms more or less equal to those of the more human trades, and at the same time would, by tending to raise the price of coal slowly but surely, encourage the development of alternative sources of power.

As it is, the Trades Unions actively oppose the practice of abandoning one trade in favour of a more congenial one.

This policy of "once a miner always a miner" necessarily involves them in opposition to any scheme for improved machinery or process which will seriously reduce the number of those who have to lead a bestial and brutalising life—since that will lead to unemployment—and they are forced to attempt to ameliorate the lot of their members by a process of cutting down production and increasing wages, which leads not to a steadily and slowly increasing cost of coal, or to a gradual decrease in its production, to which the community as a whole could adjust its methods of life, but to occasional violent upheavals which dislocate the whole life of the nation.

A Liberty Worth Safeguarding.



The educated professional classes, without any organisation comparable to those of the Trades Unions, have and still do manage to secure for themselves fairly decent working conditions, simply by virtue of their freedom to change their occupation.

Any occupation which is ill-paid or overworked is avoided by the intelligent and ambitious, and becomes a haven for the lazy and ineffective, whose employers, finding none but wasters will work for them, are—slowly perhaps, but inevitably—forced to alter the conditions of employment to attract reasonably capable men to their business.

It is of the very highest importance that this absolutely automatic effect of freedom to seek any employment should not be destroyed, as it has been in the workers' organisations, by the imposition of rigid rulings as to formal qualifications for membership of the proposed union, such as a defined period of apprenticeship or the like.

THE INSTITUTE OF AERONAUTICAL ENGINEERS.

At a meeting of the Institute of Aeronautical Engineers held on the 11th inst. Mr. R. L. Howard Flanders presided. Correspondence exchanged with Mr. A. E. Berriman relating to the scope, purpose, and title of the Institute was read and discussed. It was decided that the Institute could not rightly be accused of trespassing on the ground of any existing aeronautical institution. It was shown that the Institute would take the initiative in the holding of examinations, thereby making for a sound classification, or grading, of aeronautical engineers and for educational advancement generally. A temporary Council was elected. The members of this Council are Mr. R. L. Howard Flanders, President; Major S. J. V. Fill, R.A.F.; Mr. H. P. Folland, Mr T. C Letcher, A.M.I.N.A.; Mr. H. B. Molesworth, M.I.C.E.; Major F. G. Moore, M.A., B.Sc., M.I.M.E., M.S.E.; Mr. Frederick R. Simms, M.I.M.E., M.I.A.E.; Mr. Clarence Winchester, and Mr. W. R. D. Shaw, Organising Secretary. The newly formed Institute is to be an authoritative body on the technique of commercial aeronautics and a fountain-head for technical information. The Institute is to be governed by a council of distinguished aeronautical engineers and theoretical and practical courses of instruction are to be promoted. The Institute will also publish a periodical for educational and reference purposes. Those who have expressed a wish to be associated with the Institute as founders have been elected Honorary Founder Members. This grade was specially decided on to meet the exigencies common to any newly formed body, and it must not be regarded as a technical qualification. Forms of application for admission to the various technical grades of the Institute have been approved of by the Council, and Honorary Founder Members will receive copies of these in due course. It has been decided not to restrict membership to aircraft and aircraft engine designers and constructors only, but to embody also other men of science who have rendered signal services of benefit to aviation and aerostation. It is being ascertained to what extent the Institute can protect the interests of its members without registration under the Trades Union Acts, and legal advice on the question may be sought. Provisionally, an entrance fee of half-a-guinea is being levied for all grades, and an annual subscription of two guineas for Members, Associate Members, and Pilots. A meeting of the temporary Council has already been held.

The American Martin Bomber. Fitted with two Liberty engines of 400 h.p. each this machine has given good results.

Round the world by Air

—is mainly a question of organization **and choice of flying stock.**

As to the second factor, the B.A.T. Company can be of unusual assistance. For instance, we are the first people out with a purely commercial model (not a modified war type)—the B.A.T., F.K. 26—the machine with the largest cargo space and load capacity for its overall size and power yet produced.

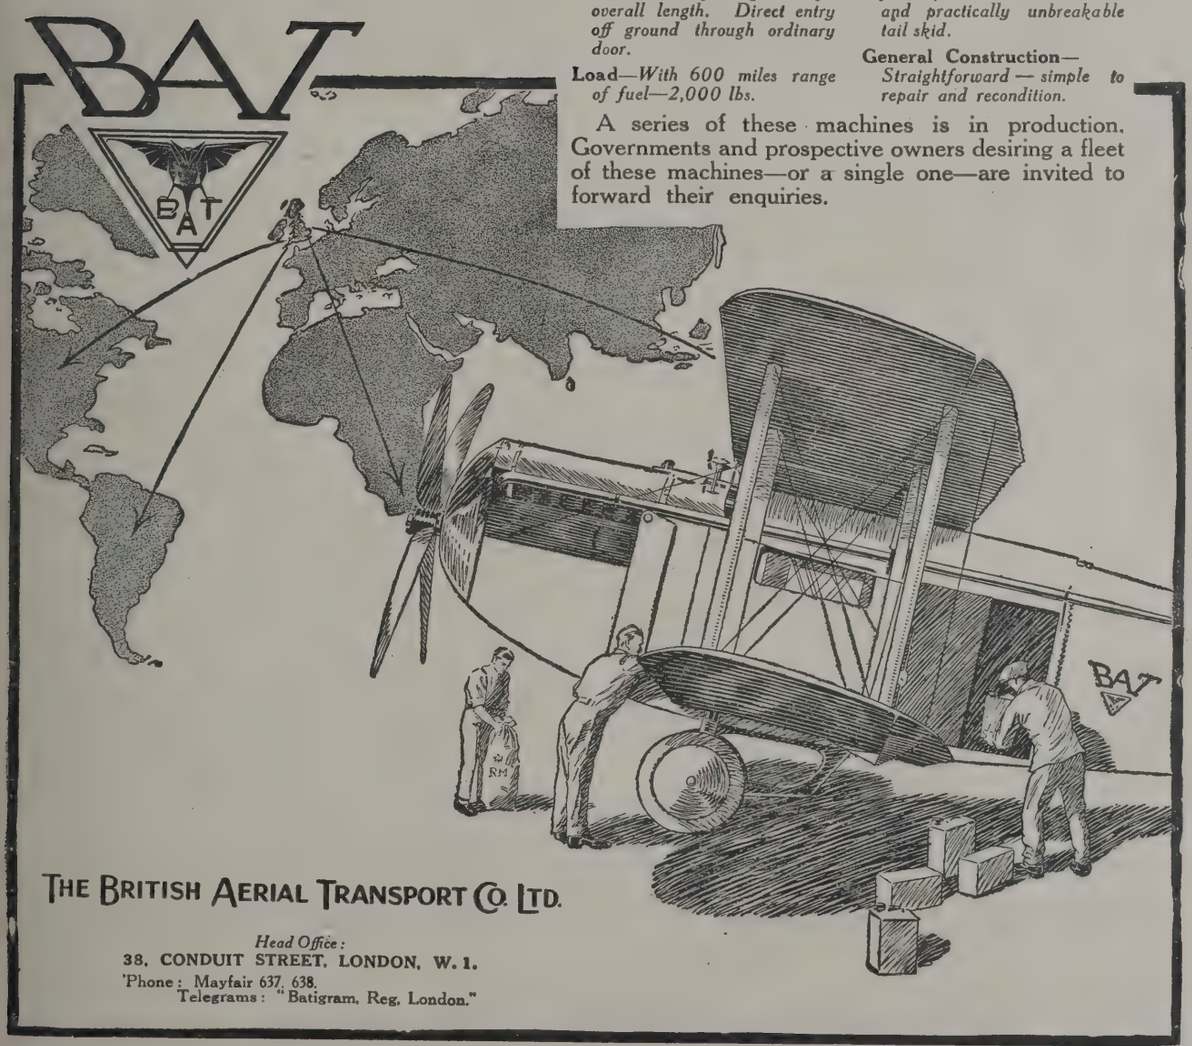
Here are some interesting points concerning F.K. 26 :—

Engine — *Rolls-Royce Eagle VIII.*

Speed—*45-120 m.p.h.*

Cabin—*Is clear of any transverse cross-bracings or other obstructions and measures 8 ft. by 3 ft. 3 in. by 6 ft.—this in a machine of only 33 ft. overall length. Direct entry off ground through ordinary door.*

Load—*With 600 miles range of fuel—2,000 lbs.*



Fuel Cost at full load—*7·2 pence per mile.*

Chassis—*A sturdy job, sprung by an unique combination of oleo and rubber shock absorbers.*

Tail—*Can be trimmed in flight from pilot's seat — steerable and practically unbreakable tail skid.*

General Construction—*Straightforward — simple to repair and recondition.*

A series of these machines is in production. Governments and prospective owners desiring a fleet of these machines—or a single one—are invited to forward their enquiries.

MODERN BRITISH AEROPLANES.

XVI.—Short Brothers, Ltd.

Short Bros. can claim to be the oldest firm of aeroplane constructors in Great Britain. The firm was originally formed by the brothers Eustace and Oswald Short in 1898 for the manufacture of balloons. The original founders were joined by their elder brother, the late Horace L. Short, in 1908, when they added to their Battersea balloon factory an aeroplane factory at Shellness, Leysdown, Isle of Sheppey.

In 1909 Mr. J. T. C. Moore-Brabazon, on a Short biplane, fitted with a Green engine, won the "Daily Mail" £1,000 prize for the first closed circuit flight on a British-built aeroplane.

In 1910 Short Bros moved their aeroplane factory to Eastchurch, and there produced a number of multiple-engined machines, which were undoubtedly the first of their class to fly. During the same year they also built the machines upon which the first four naval members of the R.F.C.—the original Naval Wing which later developed into the R.N.A.S.

In 1911 the firm commenced to build seaplanes—a practice wherein they have persisted with continuous success until this day.

In 1913 Short Bros. introduced their folding wing gear—a device now universally employed on large machines—which did more to facilitate the use of aircraft at sea than has any other improvement yet made.

During the same year large new works were established at Rochester, which, when war broke out in 1914, proved to be of the greatest possible value to the R.N.A.S.

At the outbreak of war the Short 160 h.p. Gnôme-engined two-seater was the main stay of the R.N.A.S. for sea patrol work.

This machine was followed by Salmson-engined seaplanes of very similar type, and then by the famous 150 and 225 h.p. Sunbeam-engined machines.

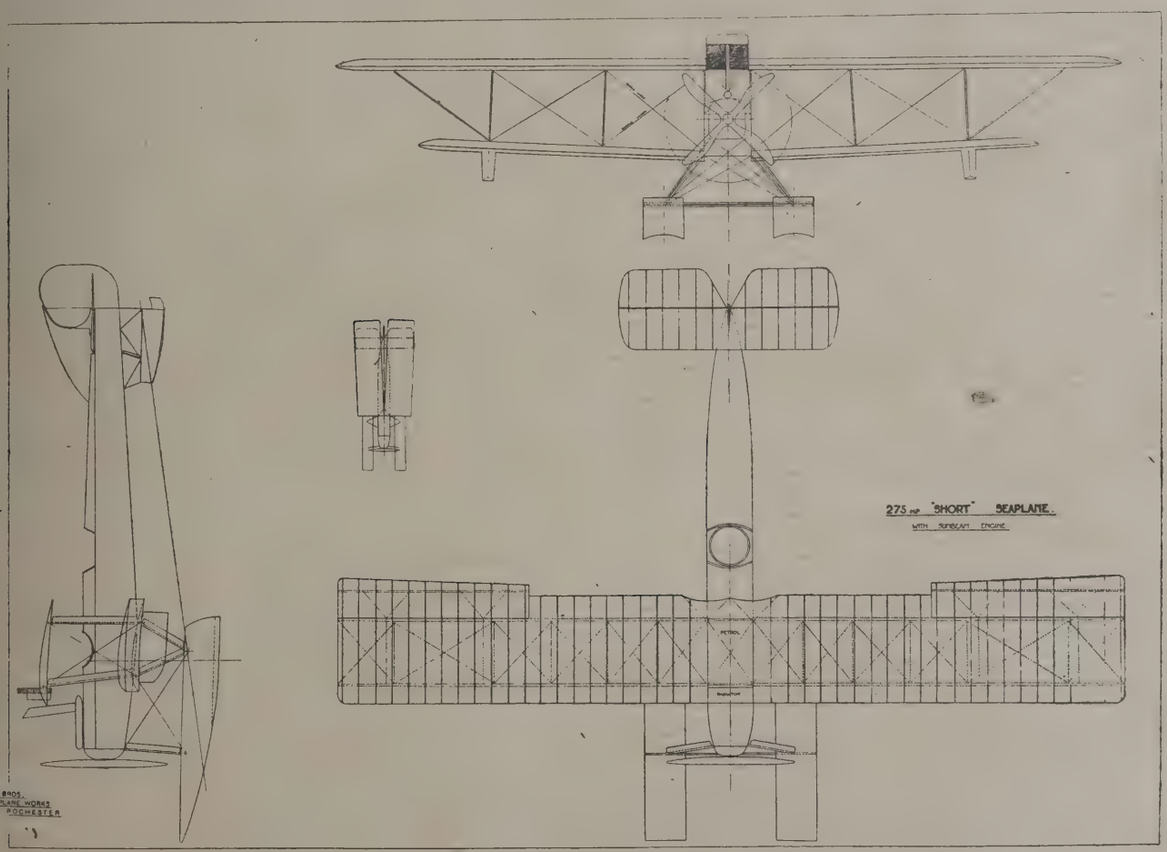
The 225 h.p. machine, somewhat modified, and fitted with the 260 h.p. engine of the same make, known as the S.184, survived to the conclusion of hostilities, and was manufactured in larger quantities, and by more different sub-contractors than any other British seaplane.

Another machine of historical interest and importance was the Short 320 h.p. torpedo-carrying seaplane, a fair number of which were sent to the Mediterranean early in 1917—but which were never given a real opportunity of showing their usefulness.

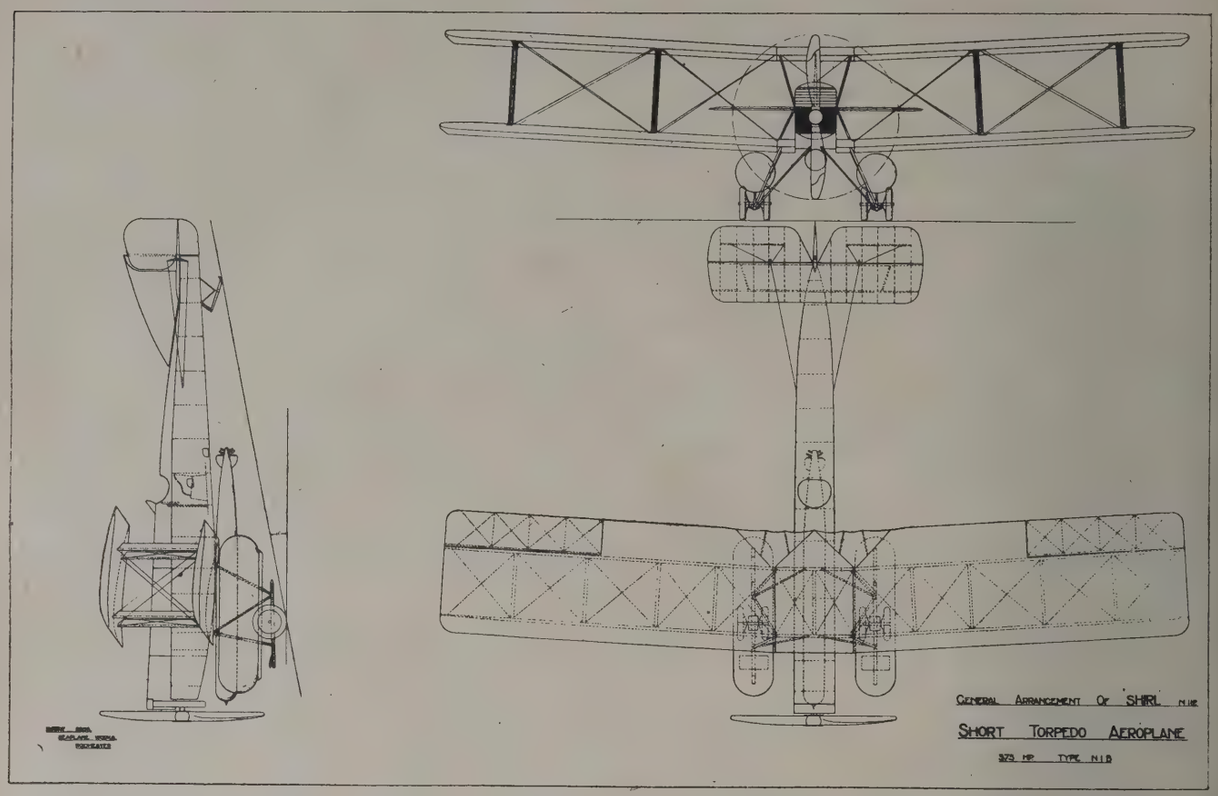
Of the more modern productions of the firm the machines hereafter described will give a fair idea.

THE SHORT N.2B. SEAPLANE.

This machine was designed, and the first edition was produced early in 1917, in response to the Air Department, Admiralty, Specification N.2B, which called for single-engined two-seater bomb-carriers for sea patrol and anti-submarine work. By the time the first machine was ready for trials the production of seaplanes had fallen into the hands of the Air Board, and the Royal Aircraft Factory had embarked upon a design to the same specification—which eventually appeared some time in 1918 as a kind of enlarged F.E. grafted on a Linton-Hope type hull to form a kind of "Bat-Boat," and with a performance considerably inferior to the Short.



Quite naturally the Short design was hung up to await the appearance of the R.A.F. boat, and the machine was only produced in small numbers too late in the war to produce any serious effect.



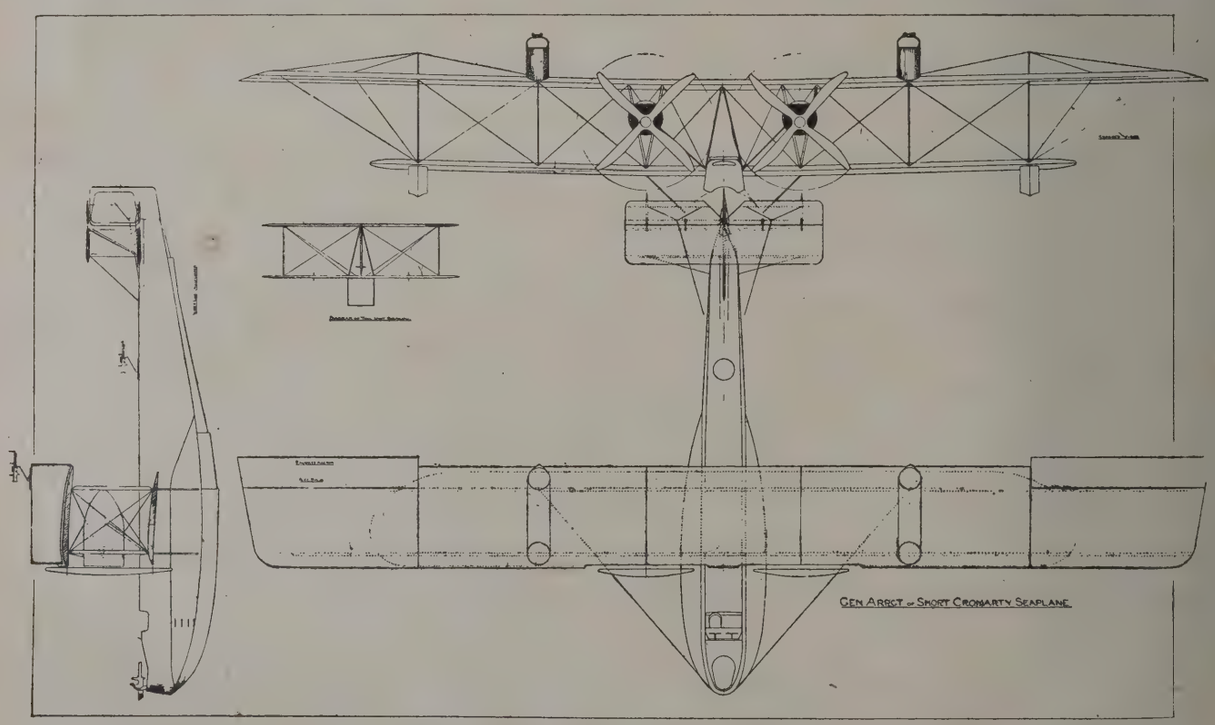
As may be seen from the line drawing, the machine is a very straightforward two-float tractor seaplane, fitted with wing-tip and tail auxiliary floats. The two seats were arranged, pilot ahead below the top centre section, and observer clear of the wings aft in a cockpit furnished with a Scarff gun-ring.

The following table gives the main particulars :—

SPECIFICATION.

Type of machine	Float Seaplane.
Name or type No. of machine...	Short N. 2 B.
Purpose for which intended	Bombing.
Span	55 ft.
Gap, maximum and minimum ...	7 ft.
Overall length	40 ft.
Maximum height	13 ft. 9 in.
Chord	7 ft. 6 in.
Span of tail	15 ft. 6 in.
Maximum cross section of body	11.5 sq. ft.
Engine type and h.p.	Sunbeam-Coatalen "Maori," 260 h.p.

Airscrew, diam., pitch, and revs.	10 feet 6 inches, diameter.
Weight of machine empty	3,050 lbs.
Tank capacity in hours	4½ hrs.
Tank capacity in gallons	70 galls.
PERFORMANCE—	
Speed low down	90 miles per hour.
Speed at 10,000 feet	88 miles per hour.
Climb—	
To 5,000 feet in minutes	12½ minutes.
To 10,000 feet in minutes	40 minutes.
Disposable load apart from fuel	1,170 lbs.
Total weight of machine loaded	4,800 lbs.



THE SHORT "SHIRL" TORPEDO CARRIER.

The experiences of 1916 and early 1917 with torpedo-carrying seaplanes led the powers that were to abandon seaplanes in favour of the "get-off-the-deck" type of aeroplane for torpedo attacks, and Short Bros., therefore, designed and produced the "Shirl" torpedo-carrier.

This machine differs little in essentials from the "Short" seaplane type—except for the absence of floats.

The undercarriage is a twin-skid affair—each skid carrying twin wheels—and with a clear drop way for the torpedo which is carried close up to the fuselage.

Above each skid a large air bag—inflatable from the cock-

To "Aeroplane" Subscribers.

HOW TO SAVE ONE GUINEA, EIGHT SHILLINGS & NINEPENCE OR SEVEN & SIXPENCE.

The subscription list of the AEROPLANE, both at home and abroad, is steadily increasing: an eminently satisfactory movement which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, M.C., A.F.C., R.A.F., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

Subscribers who take advantage of this offer will have no reason to complain of the cost of their books.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" or one year post free **(30/- inland; 35/- abroad** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

Address .....

Subscriber's Name.....

pit—is carried to give buoyancy in the event of a forced alighting in the sea, and the nose of each skid carries a small "hydrovane" upon which the first shock of alighting is taken.

The main planes are slightly Vee'd backward in plan, and are, of course, fitted with the Short folding gear.

SPECIFICATION.

Type of machine	Aeroplane.
Name or type No. of machine	"Short Shirl."
Purpose for which intended	Torpedo carrying.
Span	52 ft.
Gap, maximum and minimum	6 ft.
Overall length	35 ft. 6 in.
Maximum height	
Chord	8 ft. upper; 7 ft lower plane.
Span of tail	15 ft.
Maximum cross section of body	11 sq. ft.
Engine type and h.p.	Rolls "Eagle" 8, 400 h.p.
Airscrew, diam., pitch, and revs.	10 ft. dia.
Weight of machine empty	2,850 lbs.
Tank capacity in hours	Max. 6½ hrs.
Tank capacity in gallons	137 galls.
PERFORMANCE—	
Speed low down	99 m.p.h.
Speed at 10,000 feet	97 m.p.h.
Climb—	
To 5,000 feet in minutes	13 minutes.
To 10,000 feet in minutes	30 minutes.
Disposable load apart from fuel	2,500 lbs. normal.
Total weight of machine loaded	5,950 lbs.

THE SHORT "CROMARTY" FLYING-BOAT.

Late in the war Short Bros. turned their attention to the design of large flying-boats, and produced the design shown herewith for overseas patrol work.

The machine was designed to be self-protecting and was to be fitted with two gunners' nacelles on top of the upper plane each with two gun positions.

Instead of the usual armament of rifle calibre guns, four one and a-half pounder automatic cannons were to be fitted as well.

The line drawing and the specification give clearly the essential features of this design.

SPECIFICATION.

Type of machine	Boat Seaplane.
Name or type No. of machine	"Short Cromarty."
Purpose for which intended	Fighting and Bombing.
Span	113 ft.
Gap, maximum and minimum	10 ft.
Overall length	59 ft.
Maximum height	22 ft.
Chord	11 ft. + 10 ft.
Span of tail	23 ft.
Maximum cross section of body	56 sq. ft.
Engine type and h.p.	Rolls "Condor," two 700 h.p.
Airscrew, diam., pitch, and revs	15 ft., 970 r.p.m.
Weight of machine empty	11,000 lbs.
Tank capacity in hours	12 hours' cruising speed.
Tank capacity in gallons	650 galls.
PERFORMANCE—	
Speed low down	101 m.p.h.
Disposable load apart from fuel	2,500 lbs.
Total weight of machine loaded	18,000 lbs.

THE DESIGN OF RIGID AIRSHIPS.

The following letter has been received:—

Sir,—You are to be congratulated on your Airship Number, containing as it does a vast amount of information for the student of airship design. There is, however, a great deal of information and data still required to be made known, particularly with regard to the problem of rigid and semi-rigid airship design.

Unfortunately this knowledge is locked away in the minds of one or two men who may be called the pioneers of rigid airship design in this country. These gentlemen openly affirm that they alone in Great Britain have worked out and fully understand the problems and theories involved in the design of rigid airships.

This knowledge is naturally a carefully guarded secret, and no doubt a very great asset to the particular firm for which they are contracted to work. Whether this state of affairs is good for aviation in Great Britain is questionable.

It is extremely unfortunate that, when the Admiralty decided to proceed with rigid airship construction in 1915 they did not commandeer one of these men for the position of chief airship designer for the country; as it is, they were sent to a private firm, who naturally have shareholders to satisfy.

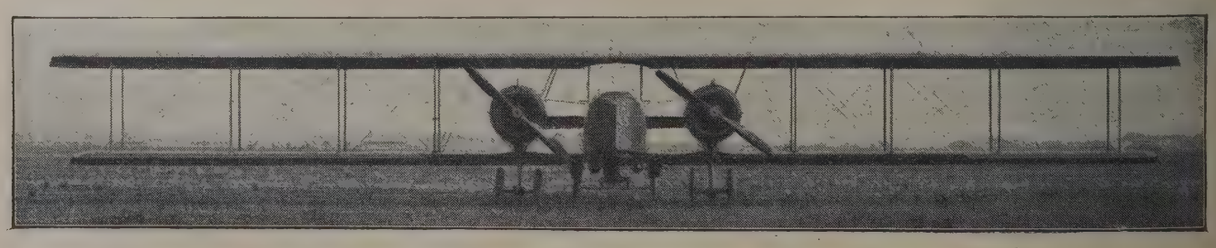
What actually happened was the appointment of a gentleman with very little knowledge of airship design. This gentleman, a member of the Royal Corps of Naval Constructors, was previously a submarine hull overseer. Reluctance to furnish privately and laboriously gained data to an outsider placed in a high position is natural, and one must blame the Admiralty for its choice of a chief airship "designer." Designer is a complimentary title, for the work carried out by his department appears to be the making of "Chinese" copies of the various German airships (of an oldish type) brought down in this country and elsewhere.

Unfortunately again, and most shortsightedly one thinks, the material for building a large shed was withheld by the Ministry of Munitions owing to shortage of steel. It almost looks as though there was some design against the firm who were admittedly the pioneers of rigid construction.

The whole history of rigid airships seems to have been marked by one unfortunate blunder after another One could mention acts of "cussedness" as far back as the "Mayfly" age.

These remarks are plain facts, and the writer has nothing but the good of British aviation at heart in submitting them for publication. That the future of the nation itself is vitally dependent on the ultimate triumph of this rapid means of transit is apparent. One remembers being taught that the prosperity of this nation is due to the large deposits of coal, but now that the production of our staple commodity is dwindling, one looks to our overseas Dominions for salvation. The airship, if really strenuously developed, would seem to be the one method for reducing the distances which separate the great English-speaking peoples from their headquarters; and, cost what it may, a big programme of airship building should be begun with the help of our rich Dominions and Colonies.

Passing from what ought to be done, we read that the airship construction programme is to be abandoned! Who is responsible the nation will wish to know. It can only be compared with the losing of the greater part of Northern America, or the giving up of Helgoland. Criminal "hypermetropia," but what a shining example in economy in these days of wicked waste!



Regarding the Editor's remarks: his one drawback the danger of fire. To those unfamiliar with airships this danger is very real, and no doubt it is the cause of anxious consideration. Yet when one calmly considers that in a rigid airship the engines are carried well away from the envelope, and there is usually a large well-ventilated air space at the bottom (unless the gas containers are quite full as at high altitudes), the peace risks appear small. Smoking compartments will no doubt be required for passenger airships, but they can be supplied with electric cigar-lighters, and be well insulated by fire-screen bulkheads.

Possibly, also, "lifeboats" in the form of gliders may be fitted (one remembers the photograph of an aeroplane leaving a rigid in flight at the exhibition in the Grafton Galleries). Personally the fear of fire would be far more real in an aeroplane, from which escape would be more difficult. The fear of fire should, at any rate, not be set against the use of passenger airships, and the timid should not suggest the postponement of airship service in the hope that helium will be made cheaper.

There should be started a national "crusade" for hustling the Government in airship construction. We already have the precedent of the Australian Government ordering passenger liners to use in competition with the shipping trusts; can we not use a few days' revenue to help build up a nucleus airship fleet?

Referring to Mr. Godfrey's remarks on our airship designers, as one said before, we have original designers, but they were not placed in their correct position according to their national importance.

"LIGHTER THAN AIR."

MORE INTERESTING GERMAN AEROPLANES.

View of the Experimental Linke-Hoffmann Giant with central power plant, showing the huge body and the air-screw mountings.

THE LINKE-HOFFMANN GIANT AEROPLANES.

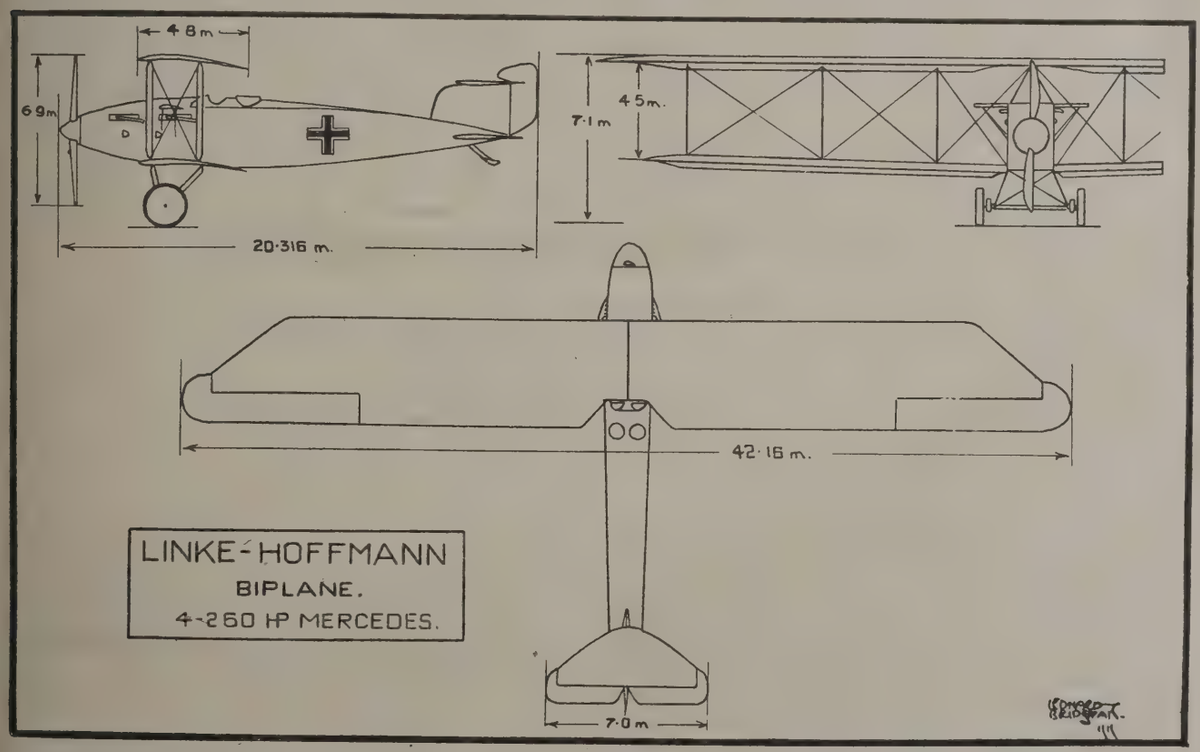
Illustrations of two types of four-engined Linke-Hoffmann machines with the central power plant arrangement have been given in earlier issues of this paper, and the following information as to the history of the type together with some details of construction will be found to be of interest

The curious-looking R.1 machine with the enormous body must be considered purely as an experiment. The size of the body was largely the result of certain tests made in the wind tunnel of the Göttingen laboratory, which showed that a body entirely filling the interplane gap gave a better overall lift to drag ratio on the whole machine than did one which only partly filled that gap.

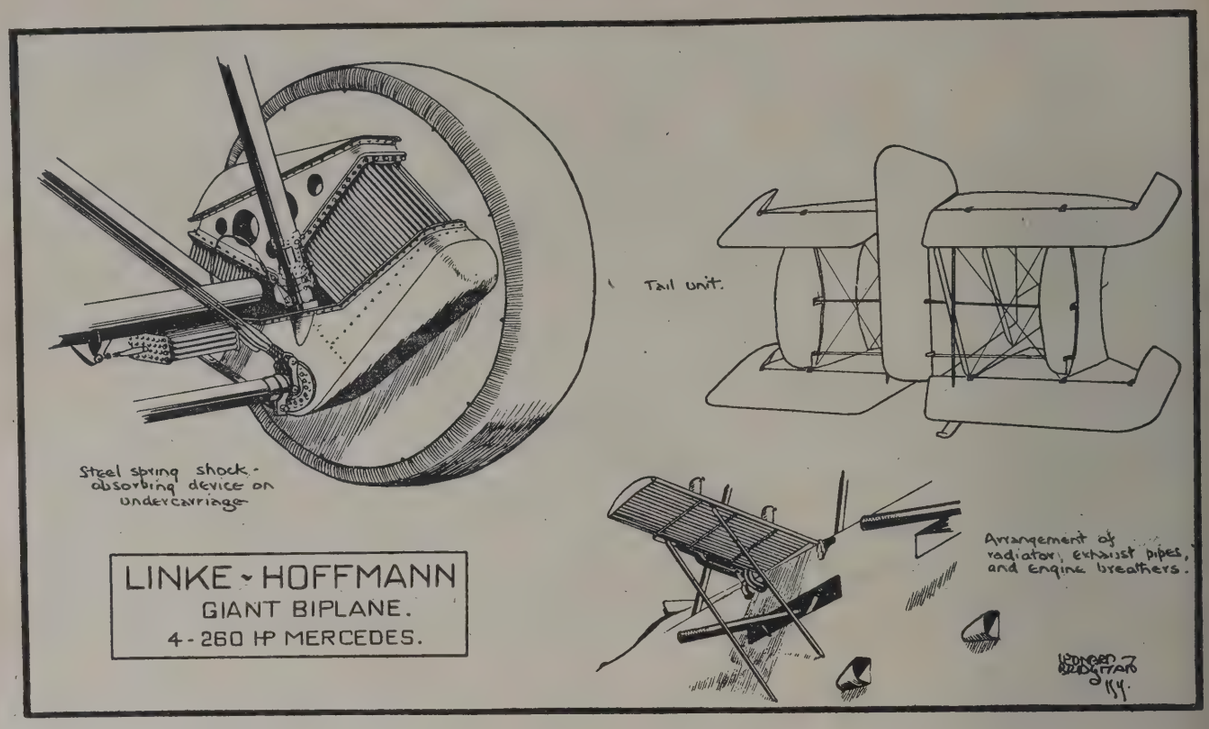
That the experience of the full-size machine by no means agreed with the results of the model test is interesting—particularly as it is believed that certain model tests made at the N.P.L. with a body reaching to the upper plane produced similar results, equally in discord with the full-size facts.

Notwithstanding the poor performance obtained with this original Linke-Hoffmann, it is said that the machine had excellent manœuvring qualities, although it was somewhat slow in answering to its ailerons and was difficult to land.

The following table gives the main dimensions and particulars of this machine :—



Span	33.2 metres
Length overall	15.6 metres
Height	6.7 metres
Total surface	265 sq. metres
Weight (empty)	8,000 kilos
Engines	Four 260-h.p. Mercédès
Useful load (including fuel)	3,200 kilos.
PERFORMANCE—	
Speed	130 km.p.h.
Climb—	
To 3,000 metres	2 hrs



The later Linke-Hoffman — type L.H.W.R.2—was based upon the experience gained with the central multiple engine installation of the R.1.

One airscrew only was used, and the normal lines of the single screw tractor type of machine were adhered to. The power plant consisted of four 260-h.p. Mercédès engines geared together.

The general arrangement is shown in the attached drawings, and a photograph is reproduced showing the engine room interior.

The undercarriage of this machine is of interest. It is in general design of the conventional two-wheeled V type. The wheels themselves are of steel, apparently fitted with wooden tyres, and supported on a multi-spiral spring shock-absorbing device, which is shown in a sketch. It is claimed that this undercarriage has remarkable qualities and it is stated that during the winter, to avoid landing in heavy snow on the aerodrome, the machine landed in an adjacent marsh and rolled through two ditches before coming to rest. The wheels had then sunk 30-cms. (12 inches) into the marsh without the

machine overturning, and a steam tractor was needed to tow the machine out. The following are the general particulars of the L.H.W.R.2 :—

Span	42.1 metres
Length	20.3 metres
Height	7.1 metres
Total surface	320 sq. metres
Weight (empty)	8,000 kilos.
Tank capacity	7 hours
Useful load (including fuel)	4,000 kilos.
PERFORMANCE—	
Speed	130 km. p.h.
Climb—	
To 3,500 metres	2 hours

It is said that the machine can carry a maximum load of 7 tons, and that so loaded, with two pilots, two mechanics, two navigators, together with luggage and instruments, the machine can carry fuel for 30 hours at 120 km. per hour.

In its peace-time condition the machine is fitted to carry 12 passengers in an enclosed cabin behind the pilot's cockpit.

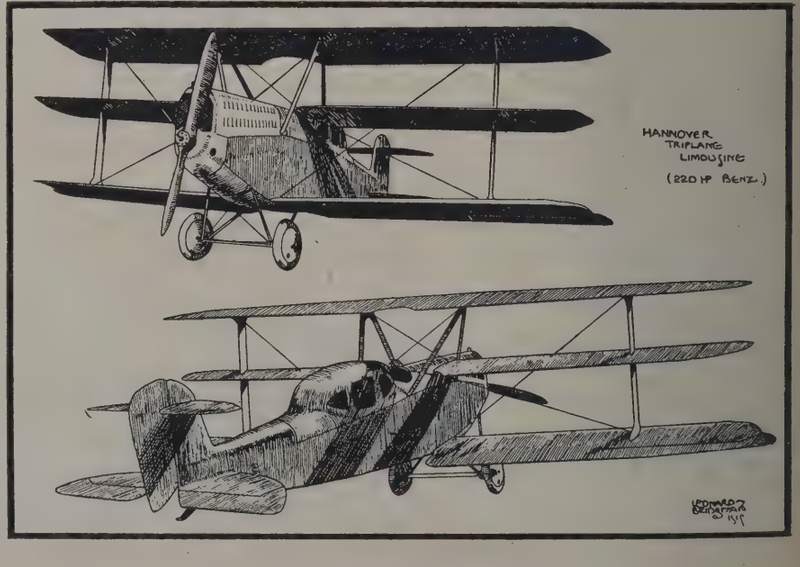
THE HANNOVER TRIPLANE.

One of the latest productions of the Hannover Waggon Works is a limousine triplane fitted with a 230 Benz engine. The machine resembles the well-known Hannover biplane in some respects, the fuselage and tail unit being almost identical with the exception that a comfortable passenger compartment is substituted for the rear observer's cockpit, and the radiator is placed in the nose instead of being carried in the centre-section. The tail plane is also adjustable so as to offset the varying weights carried in the passenger cabin.

The cabin, which is 1.9 metres long by 1.1 metres wide by 1.5 metres high, has two seats facing the direction of flight and two folding seats against the front bulkhead. This bulkhead is well padded as a protection, in the event of a crash, a further safeguard being the provision of a luggage apartment, capable of holding 200 kgs. between the pilot's cockpit and the cabin. Further stowage space for light luggage, etc., is provided for in rear of the main seats of the cabin.

Entrance is through a half-deck door in the upper part of the cabin, the opening and closing being effected by pressure from the inside. An adjustable heating apparatus is provided. The following are the principal dimensions, etc. :

Span	10 metres
Length	8.1 metres
Height	3.8 metres
Gap	2.8 metres
Area	45 sq. metres
Load per sq. metre	35 kilos.
Load per h.p.	6-7 kilos.
Engine	230 h.p. Benz



AN IMPORTANT AMALGAMATION.

It is announced that the British Westinghouse Electric and Manufacturing Company, Ltd., has changed its title to that of the Metropolitan-Vickers Electrical Company.

Originally, the British Westinghouse Company was largely controlled from America, but in 1917 the American holding in the company was taken over by the Metropolitan Carriage, Waggon and Finance Company.

This concern has now amalgamated with the Vickers' interests, and becomes entirely British.

Both parties to this combination have aeronautical interests.

SIR CHARLES PARSONS ON AIRCRAFT.

In his Presidential Address to the British Association for the Advancement of Science at Bournemouth, Sir C. Parsons said :—

In August, 1914, the British Air Services possessed a total of 272 machines, whereas in October, 1918, just prior to the armistice, the Royal Air Force possessed over 22,000 effective machines. During the first twelve months of the war the average monthly delivery of aeroplanes to our Flying Service was 50, while during the last twelve months of the war the average deliveries were 2,700 per month.

So far as aero engines are concerned, our position in 1914 was by no means satisfactory. We depended for a large proportion of our supplies on other countries. In the Aerial Derby of 1913, of the 11 machines that started, not one had a British engine. By the end of the war, however, British aero engines had gained the foremost place in design and manufacture, and were well up to the requirements as regards supply.

The total horse-power produced in the last 12 months of the war approximated to eight millions of brake horse-power, a figure quite comparable with the total horse-power of the marine engine output of the country.

THE COMMERCIAL AIRSHIP.

In view of the recent Transatlantic flights, I feel that it may be opportune to make the following observations on the comparative utility of aeroplanes and airships for commercial purposes. In the case of the aeroplane, the weight per horse-power increases with the size, other things being equal. This increase, however, is met to some extent by a multiplicity of engines, though in the fuselage the increase remains.

On the other hand, with the airship the advantage increases with the size, as in all ships. The tractive effort per ton of displacement diminishes in inverse proportion to the dimensions, other things, including the speed, being the same. Thus, an airship of 750 ft. length and 60 tons displacement may require a tractive force of 5 per cent., or three tons, at 60 miles per hour; and one of 1,500 ft. in length and $8 \times 60 = 480$ tons displacement would only require $2\frac{1}{2}$ per cent. $\times 480 = 12$ tons at the same speed, and would carry fuel for double the distance.

With the same proportion of weight of hull to displacement, the larger airship would stand double the wind pressure, and would weather storms of greater violence and hailstones of greater size. It would be more durable, the proportional upkeep would be less, and the proportional loss of gas considerably less. In other words, it would lose a less proportion of its buoyancy per day.

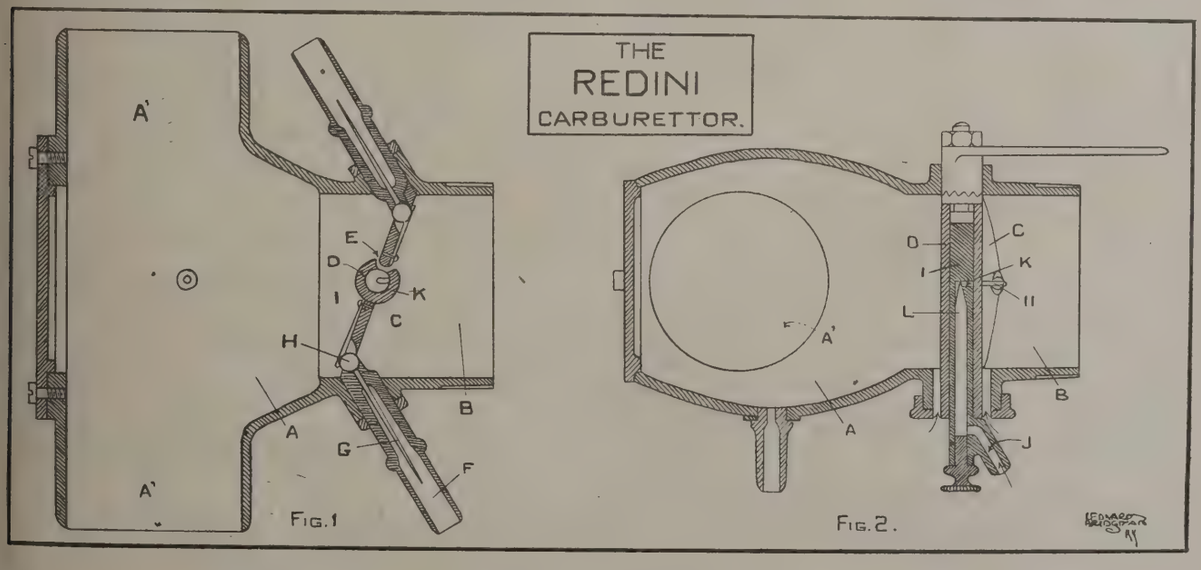
THE ONLY LIMITATION TO SIZE.

The airship appears to have a great future for special commerce where time is a dominant factor and the demand is sufficient to justify a large airship. It has also a great field in the opening up of new countries where other means of communication are difficult. The only limitation to size will be the cost of the airship and its sheds, just as in steam vessels it is the cost of the vessels and the cost of deepening the harbours that limit the size of Atlantic liners.

Such developments generally take place slowly, otherwise failures occur—as in the case of the Great Eastern—and it may be many years before the airship is increased from the present maximum of 750 ft. to 1,500 ft. with success, but it will assuredly come. If, however, the development is subsidised or assisted by Government, incidental failures may be faced with equanimity and very rapid development accomplished. In peace time the seaplane, aeroplane, and airship will most certainly have their uses. But, except for special services of high utility, it is questionable whether they will play more than a minor part as compared with the steamship, railway, and motor transport.

THE REDINI CARBURETTER.

This carburetter has been designed primarily for aero engines and is illustrated in horizontal and vertical sections in Figs. 1 and 2 respectively. The carburation chamber has three pipe necks A^1, A^1 and B. The air supply enters the pipe-necks A^1, A^1 whilst the explosive mixture is generated in the pipe neck B, which is provided with the throttle C and the two sprayers F. These two sprayers have a variable delivery which corresponds to the extent of the opening of the throttle.



Each variable delivery sprayer consists of a nozzle for the entry of the liquid fuel extending obliquely into the carburation chamber close to the throttle and has an obturator in the form of a needle G of varying diameter mounted so as to slide in the exit hole of the nozzle. The needle G is provided with a ball-shaped end H by means of which it is jointed to the throttle, this ball-shaped end serving to close the exit orifice of the nozzle when the throttle is in the shut position.

The carburetter further comprises one or more jets of constant delivery that are capable of adjustment when tuning up the motor. In the drawings only one of these jets is shown. This is of the needle type and is mounted in the interior of the hollow spindle I of the butterfly throttle-valve. The cavity in G communicates with the outside of the carburetter for the entrance of the liquid fuel through J, and also with the mixing chamber through K, which is adjustable from without through L. The passage K into the mixing chamber is closed by the hub D of the throttle C when this latter is in any position from half closed to fully closed. Thus the jet only comes into action when the orifice E is open, that is, at about half throttle. By the use of this instrument, adapted to any type of engine, the most efficient carburation can be guaranteed.—T. S. H.

ALUMINIUM.

The uses to which aluminium and its alloys can be put are very extensive, and owing to its extreme lightness and the great ease with which certain complicated parts can be produced it is almost indispensable.

A very interesting publication—"Aluminium Sheet and Sections in Automobile and Aircraft Construction"—issued by the British Aluminium Co., Ltd., of 109, Queen Victoria Street, London, E.C.4, contains much useful information, together with sundry comparative tables, which should be of use to all connected with the aeronautical industry. This booklet, together with a similar one dealing with Aluminium Castings in Aircraft Construction, and numbered 159 and 157 respectively, should be in the hands of all those concerned with the design and construction of aircraft.

Fine Grain Means Quality.

The best wood has the finest grain, and grain in steel is equally a test of quality. That is why

Edgar Allen's

Red Label Steel

can be trusted to do its work efficiently. Examination of a fractured piece reveals a silken surface. Owing to the presence of a small percentage of tungsten in its composition, this steel offers far greater torsional resistance than any ordinary carbon tool steel. This, together with its uniformity, makes it ideal for Reamers, Threading and Screwing Dies, Broaches, etc., etc.

SHEETS—Mild steel, nickel steel, brass.

BOLTS & NUTS—Screwed B.A. B.S.F. and Metric. All diameters and lengths.

TURNBUCKLES — Metric and A.G.S. Double eye and one eye and one fork.

SCREWS—Brass and iron, wood point.

DRILLS, REAMERS AND OTHER TOOLS.

BRADS—Brass and steel. Flat head.

BARS—Mild steel, square, round, hexagon, angles, &c.

WIRE—High tensile steel, copper, brass, soft iron and tinned flexible steel rope.

ALSO PLYWOOD IN ALL SIZES & THICKNESSES.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

THE TREATMENT OF KEY INDUSTRIES.

By "MEDWAY."

I have already remarked that the Government is going through an epileptic fit of economy. At the present moment the patient is very destructive. He is, so to speak, waving his arms about and breaking everything within reach. When he comes round a little, he may be got to realise that there is such a thing as constructive economy, which consists of expenditure or investment made with a view to subsequent profit.

Following upon the bright idea of stopping all work upon airships, we have the wholesale cessation of Government contracts for the supply of aeroplanes. It would, of course, be absurd for the Government to go on buying war machines at a war-time rate for an indefinite period. We cannot maintain a great industry permanently by inventing useless work for it to do and then deliberately breaking up its products as soon as they are complete. We must remember, however, that in this case we are dealing with what, though it is not officially admitted, is undoubtedly a key industry.

The War Is the Test.

What *is* a key industry? As the Prime Minister tells us, "The war is the test." We have here an industry essential for war, and so neglected before the war that its output was wholly inadequate for the essential task of war. It is an industry which the Government was obliged during the war to promote and foster. It is an industry which, when the Government support is withdrawn from it, cannot conceivably maintain itself for many years to come at the level shown to be necessary in the event of war. "The war," let us repeat, "is the test."

If, when he defined a key industry, the Prime Minister had, instead, been endeavouring to state the essential facts with regard to the Aircraft Industry, he could hardly have done it more accurately. He left it to the Board of Trade to publish a list of key industries. I do not know whether he dictated the list or allowed the President of the Board of Trade to prepare it. Anyhow, it is obvious that the person who compiled the list had never heard of the Aircraft Industry. Had he done so, it could not possibly be omitted.

Admittedly, its inclusion would have been of very little use at the moment. The Government, having talked for four years about its firm resolve to maintain key industries by whatever means might prove necessary, has finished up by deciding that the only form of maintenance consists in prohibiting competitive imports for a brief period.

Prohibition of Import.

Now it chances that we have here an industry in respect of which imports for some time to come will be negligible, even were they unrestricted. I speak from the point of view of the British Isles. A prohibition of import of aeroplanes and airships into any part of the British Empire would be a step in the right direction. Alternatively, I suggest an import duty of 100 per cent., coupled with absolute Imperial Preference, providing complete free trade in aircraft between all parts of the Empire.

My main point is, however, that there are other ways of fostering key industries, even if we forget all about tariffs and prohibitions. If the Government is not justified in buying aircraft of fighting types, may it not be justified in buying and using aircraft for the carriage of mails and for commercial and public services? A partial alternative to actual purchase appears to be a scheme of subvention on really generous lines.

Before the war all the great military Powers paid quite substantial annual subsidies to the owners of motor lorries more or less suitable for military use. In this country the subsidy was about £110 per lorry spread over three years. The amount was small because the estimated requirements of our Army were also small. In France the payment in respect of each lorry was £300 spread over a period of four years. In Germany it was no less than £450 spread over a period of five years. This was for a larger type of lorry.

Unlimited Requirements.

Roughly speaking, then, the subsidy necessary was generally estimated at about half the first cost of the vehicle. Now, as regards aircraft, we are under no delusions as to the extent of our war-time demand. It is practically unlimited. We can never have too many machines. In fact, we can never have enough. Would it, then, be unreasonable if the Government were to subsidise the owners of aircraft maintained in satisfactory condition on a scale which would amount in the aggregate to about half of the first cost of the machine in every case? Such a subsidy would not necessarily be paid in respect of every machine manufactured, but only in respect of those more or less adaptable for some class of military work.

Another form of subsidy would consist in the assistance of aerial operating concerns, the subsidy in this case making it possible for such concerns to show a reasonable but not an excessive profit. This latter type of subsidy would not be paid by the War Department, but by the Government as a whole. Its purpose would be in no sense military. The object would be the development of Empire resources by the opening up of improved communications, and the amount of the subsidy would be more or less dependent on the value of the proposed services from this particular point of view.

All this might suffice to keep in existence the nucleus of an Aircraft Industry. From this nucleus a great industry would gradually grow up. In the meanwhile, we must maintain in existence and in operation the factories and plant necessary to make rapid aircraft production possible in emergency. How can this be done?

A Suggestion.

There are many classes of goods in common use for the supply of which we are largely dependent upon import. They could be made in this country at a price, but the price would not be naturally competitive. Would it not be possible to make up a little list of useful articles not built here, but capable of being made in existing aircraft works? The articles on such a list could then be allocated to various aircraft firms who had found it possible, with-

out some assistance, to keep their machines and staff employed. In every case a subsidy would be paid such that, when the amount of the subsidy had been deducted from the carefully ascertained cost of efficient manufacture, the figure reached would be such that the goods could be sold at a competitive price and at the same time at a reasonable but limited profit.

During the war the Ministry of Reconstruction possessed what was called a New Industries Committee. I imagine that the report of that Committee would suggest quite a number of possible new industries, some of which have not been taken up for the simple reason that manufacturing costs in this country are at present too high to make the products competitive.

This scheme would, of course, mean the expenditure of money. Its cost would, however, decrease year by year, and, by the time all conditions again become quite normal, it might be found possible to withdraw the subsidies altogether. Meanwhile, we should be keeping a quantity of labour in useful employment. We should be creating new home industries, and we should be preserving, around every nucleus of aircraft production, premises and plant which could be diverted rapidly to the quantity production of aircraft in the event of a national emergency arising.

It seems to me that some such plan as this would enable us, at the lowest possible cost, to get over the serious difficulty occasioned by the fact that the peace-time demand for aircraft must for some time continue negligible when compared with the demand which would arise in the event of war.

SERVICEABILITY.

In an aerodrome near the E.L.T.A. (Amsterdam) is a Bristol Fighter delivered by the constructors in September, 1917. It was immediately put into commission under active service conditions, and after doing considerable work in this direction unfortunately landed in Holland. The pilot was naturally interned, and the machine was soon after bought by the Dutch Government. Though it has been continuously flown by Dutch officers, it has never been repaired or renovated in any way, and every unit is exactly as when it left the Bristol works. Even the "Cellon" dope has never been renewed. The machine is still in service and in great favour with the Dutch pilots.

E.L.T.A. APPRECIATION.

A member of the E.L.T.A. Committee sent the following letter, dated Sept. 4th, regarding the F.5 Flying-boat to Mr. Volk, the manager of the Gosport Aircraft Co. :—

Dear Sir,—The E.L.T.A. Committee received with pleasure your cable about your safe arrival in England. We are very glad to have heard you enjoyed your stay in Holland; we must acknowledge that your machine did splendid work when it arrived late in the evening in Schellingwoude. We admired your flights on the opening, and we were astonished that your boat was 26 days with rough weather on the water, and was always ready to start. We think it is a big advertisement for your firm, and that you are on the right way in building flying-boats that do not want hangars. I have the pleasure of expressing you all thanks and congratulations of the E.L.T.A. Committee, and I herewith do the compliments of all you met and specially kindest regards.—(Signed) FLEMMAN.

HOW THE WAR WAS WON.

Lord Montagu of Beaulieu, in a foreword to a book entitled, "The Shell that Hit Germany Hardest," issued by the "Shell" Marketing Co., Ltd., says : "The Germans were keener on sinking vessels conveying oil than on any other ships that sailed the ocean. They realised at the very beginning of the war that the liquid fuel supply was vital to our sea supremacy then and to our air supremacy later."

The book has been produced to show the work that was done by the Shell Co., and it contains much that will be of interest to those who were not behind the scenes. M. Bérenger, the Commissioner-General of Petroleum in France, paid a high tribute to the company in a speech on a certain occasion. He said : "May I be permitted to state here solemnly, gentlemen, in the name of the French Government, how much gratitude we owe in a special way to Mr. Deterding and to his associates, and to the Asiatic Petroleum Co., for the support which they gave since October, 1914, to the defence of our country by placing at our disposal their precious petrols from Borneo and Sumatra which contained the toluenes, the xylenes and the benzenes which were absolutely indispensable for the manufacture of our most powerful explosives, and of our most efficient extra-aviation petrols."

"Thanks to toluol, we were able to return blow for blow the 'cards' sent us by the Germans from their great cannon : *without this invaluable explosive*, given to us at a time when we most required it, *the war would have been lost*. It fired our great cannon, and, in a word SAVED VERDUN."

In 1917 it became apparent that stocks of petroleum products would fall to an alarming extent in Great Britain owing to the losses of tank steamers due to submarine warfare.

It was at this crisis that the Shell Co. put before the Admiralty the proposition of bringing liquid fuel from abroad in the "double-bottoms" or ballast tanks of ordinary merchant ships—a plan which years earlier the Company themselves had successfully employed—to supplement the alarmingly reduced tanker fleet in conveying fuel oil to this country.

This idea, the details of which were worked out on behalf of the Admiralty by Mr. C. Zulver, the company's marine superintendent, proved the one possible solution to perhaps the most baffling problem the Admiralty had to face throughout the war. During the most critical period, as much as 125,000 tons of oil was carried in this way in one month, and by the date of the signing of the armistice, 1,014,570 tons of liquid fuel had been safely brought over under this scheme. Stores of oil had reached a normal amount, and all danger of another shortage had long since passed.

There is much other information in the book, which is well produced and well illustrated. It does not err on the side of modesty and at times one is inclined to suggest that although "Shell" did win the war the fighting forces helped a little.

ON COMMERCIAL AVIATION.

A booklet entitled "Commercial Aviation and its Relation to the Community" has just been issued by the United Aircraft Engineering Corporation, of New York. It is the first of a series which will show the present status of commercial aviation and its future possibilities.

Considerable space is given to aerodrome construction, and illustrations of various types of landing fields are given. Other pages are devoted to types of aircraft, speed, endurance, landing, load, altitude, safety, cost, cost of operation, performance, etc.

While it was originally intended that the distribution of these booklets would be very limited, it is now possible for all those interested in commercial aviation to secure a copy until the present supply is exhausted. Requests should be made to the Engineering Department of the United Aircraft Engineering Corporation, 52, Vanderbilt Avenue, New York City.

A DENIAL.

The report that the works of Whitehead Aircraft have been taken over for the production of motor-cars is denied officially. The report was not published in THE AEROPLANE.

A SALE OF AIRSCREWS.

The Aircraft Disposal Department of the Ministry of Munitions are offering aircraft propellers for sale. They comprise new aircraft propellers made of the finest walnut and mahogany, and are offered for sale at the following rates : with four blades at 30s. and with two blades at 25s.

These propellers cost originally from £15 to £25, and were made for engines which are now obsolete. They can be adapted for many purposes, such as hat racks, and for appropriate hall uses, to which they add a note of distraction if fitted with a clock or barometer.

Sales can be made in a few minutes and the goods taken away or arrangements made for delivery.

Offers are invited for a limited number of propellers taken from captured enemy aeroplanes. Communications should be addressed to the Controller, Aircraft Disposal Department, York House, Kingsway, W.C.

TRIPLEX GLASS.

It is now announced that the Triplex Safety Glass Co., Ltd., of 1, Albemarle Street, Piccadilly, W.1, have two new models of goggles ready for the market, which have been specially designed for motorists. One is a model for women motorists, and both can be had at a reasonable price, namely, Model A, 10s. 6d., and Model C, 12s. 6d. (including case).

THE AIRCO CONTINENTAL SERVICES.

Those who hold pessimistic views regarding commercial aviation would do well to pay a visit to the Airco headquarters at 27, Buckingham Gate, S.W.1, where an atmosphere of enthusiasm prevails.

The London-Paris Air Service is becoming more and more successful as the days pass and the reliability of the machines is proved to commercial men. Some of the leading banks of London and Paris are now using the service daily for the transmission of important documents.

Every day about 40 lb. weight of assorted British newspapers is sent over to Paris, where they are sold in the afternoon of the day of publication, whereas those that are sent by train do not arrive until the following day. Paris newspapers are also brought to London. News photographs and cinematograph films are also sent regularly by air between the two capitals, and some commercial firms have already adopted this means of rapid transit for sending samples of various manufactures abroad.

The fashion creators in Paris have been quick to realise the possibilities of the service, and a Manchester firm claims the credit of having Paris hats brought to England by air for the first time. A firm of furriers in Paris recently sent about 25 lb. weight of expensive furs from Paris to London, willingly paying the £9 freightage, and another firm sent a sample bottle of champagne which was wanted in London quickly so that an important order might be booked.

Passengers continue to travel by the route and are invariably enthusiastic. Major-Gen. the Right Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., and Major-Gen. Sir F. H. Sykes, K.C.B., C.M.G., flew over recently to sign the Air Convention, and the return trip was made in the extremely good time of two hours.

A new machine, the Airco D.H.18, is shortly to be put on this air line especially for passenger service. This machine will be fitted with a 450 h.p. Napier "Lion" engine, and will carry eight passengers in addition to the pilot; each passenger will be allowed to carry a small suit-case, and it is claimed the seating accommodation is more comfortable than that in a first-class railway carriage.

An interesting test was made recently to prove that messages could be sent to Paris more quickly by air than by cable. A cablegram was sent from the London office at 12.15 p.m., and at the same time it was telephoned to the aerodrome and was given verbally to the pilot of one of the machines about to start. The verbal message reached the person for whom it was intended at 4 p.m., but the cablegram did not reach its destination until 10 a.m. the next morning.

With regard to the transmission of parcels, it is pointed out that the gain in time is far greater than it appears to be at first sight. One is apt to compare the 2½ hour flight with the eight or nine hour train and boat journey on the passenger service, but this is not a fair comparison. If a parcel is sent by air at mid-day it reaches Paris in the short time of 2½ hours and is then delivered very speedily to its destination, whereas if a parcel is sent by ordinary post, as things exist to-day, it is not likely to reach its destination till two or even three days have elapsed. It is for this reason that commercial houses are realising the enormous value of this service.

One of the most hopeful signs of the times is the fact that at the present moment three Continental Governments are negotiating with Airco, Ltd., for the inauguration of aerial mail services. These Governments wisely realise that the experience which the company have already gained makes them better judges than amateur officials of the manner in which such mail services should be run. Accordingly they are prepared to leave the entire arrangement of the services to Airco, Ltd., who are expected to send their representatives to choose aerodromes, plan the necessary buildings, repair shops, arrange the supply and storage of fuel and every other detail in the complicated organisation necessary for the efficient running of these services.

The view of Airco, Ltd., is that for a long time to come the most profitable commercial use of the aeroplane is that of carrying mails and parcels. Between London and Paris goods are carried at the rate of 7s. 6d. per pound normally, but firms that make regular contracts can have goods carried at a rate as low as 3s. 9d. per pound. Passengers are charged £21 for each journey. If passengers' fares were arranged according to weight, a 10-stone person would be called upon to pay 50 guineas at the rate of 7s. 6d. per pound, so that it is obvious for the present the carriage of goods is more profitable than that of passengers. Since the first week in which the service has been in operation, there has been a steady increase in the amount of goods sent to the aerodrome daily for transmission to Paris.

Most of the big London newspapers, including the "Times," the "Daily Telegraph," "Morning Post," "Daily Mail," "Daily Express," etc., have made regular contracts. The week of very bad weather through which the machines flew with only one interruption did much to inspire confidence in the service, and every week that goes by inspires greater faith.

The Airco, Ltd., are gathering statistics as to cost that will prove of inestimable value to commercial aviation. Although they are not yet in a position to make an actual statement regarding the financial side of the venture, they are finding out that the speculations of writers who have tried to estimate the cost of running a regular service without having actual experience on which to base their ideas, are very far from being accurate.

There is no doubt that Airco, Ltd., are at the present time doing pioneer work in all parts of the world that will eventually prove of enormous value to this country. In South America, Spain, India, Australia, South Africa, in fact in every part of the globe, they have representatives who are demonstrating the possibilities of commercial aviation; and while pessimistic people are still saying that the day of successful commercial use of aircraft is still far distant, the firm is quietly doing the work that is bringing that day nearer.

BARIMAR OVERSEAS DEVELOPMENTS.

"La Société Française Barimar" is the title of a company which has recently been formed in Paris, with a capital of £5,000, to exploit the Barimar scientific welding processes in France, Tunis, and Algeria. The factory, which is situate at 48, Rue d'Alsace, Clichy (Seine), is under the personal supervision of Mr. Cyril Rose. Mr. Rose, who has taken a leading part in the establishment of the new company, is constantly investigating the problems of metal fusion, with the object of obtaining the best results from modern scientific welding processes, and under his management the French branch should speedily thrive.

SHORT'S ATHLETIC SPORTS.

A sports meeting in connection with Short's Social and Athletic Club was held in the Paddock, Rochester, on Aug. 23rd, under the Amateur Athletic Association rules. There were 35 events (including heats) on the programme. The sports started promptly at 2.0 p.m.

Mr. V. O. Levick, the hon. sec. of the sports club, had many successes, and also had time to arrange the lengthy programme and attend to many secretarial duties.

The open events produced some excellent entries from the Army and Navy and athletes from the neighbouring places. A local band played during the afternoon, and tea was provided in a special marquee. The referees were: Mr. H. O. Short, Major Sippe, Major Gnosspelius, and Major Bell.

A WORKS OUTING.

The annual beanfeast at Brighton took place recently. It was arranged by the engineers of the welding firm, and a cordial invitation to the Directors to accompany the party was gladly accepted.

Mr. C. W. Brett, the Managing Director, said that since the incorporation of the company in 1906 there had never been a strike. The staff have worked hard all the time. During the war 70,000 breakdown jobs have been through the works, and there has never been a hitch even for an hour.

Barimar, Ltd., is establishing a chain of welding businesses around the world, and their engineers will soon be on the way to Australia, New Zealand, India, North, South, and East Africa, Italy, France, Denmark, Norway, Sweden, Canada, and South America. Some of these branches are already operating, and others are being formed as rapidly as possible.

Men of character and stability skilled at welding may register with Barimar's for duty at the new overseas branches. Applicants will be required to spend short periods with good pay in the London factory in order to thoroughly familiarise themselves with the methods of the firm.

THE SECOND ARRIVAL.

A. V. Roe and Co., Ltd., are constructing at their Hamble works another Avro "Baby" with 35 h.p. engine.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

The London-Paris Air Services.

During the past week two fresh companies announced that they were starting London-Paris services. Both are French, the Compagnie des Messageries Aeriennes and Farman Frères.

On Sept. 16th for the first time a Bréguet biplane owned by the first-named company travelled over the Paris-London air line. The machine was flown by a French pilot, M. Massot, and carried a mechanic only. On Friday, Sept. 19th, the Bréguet started from Hounslow soon after noon, and passenger accommodation was available.

The Bréguet service by the Compagnie des Messageries Aeriennes is run in connection with that of Handley Page, Ltd. On those days when the Handley Page machines do not fly—viz., Mondays, Wednesdays, and Fridays—the Bréguet machines will start from Hounslow at noon. Similarly, they will leave Le Bourget aerodrome at noon on Tuesdays, Thursdays, and Saturdays. They will carry light goods as well as passengers, and it is expected that the journey will be made in less than 2½ hours.

The machine is fitted with a 300 h.p. Renault engine of a new type, and has a limousine cabin seating two passengers. The pilot is placed above and behind the cabin. The Bréguet firm have been famed for steel aeroplane construction since 1912. It is interesting to recall that a Bréguet machine made the first Channel crossing with three passengers over six years ago. The pilot was the late Capt. W. B. Rhodes-Moorhouse, V.C.

The Compagnie des Messageries Aeriennes has been running a postal, passenger, and goods service between Paris, Brussels, and Lille since April, and it will now be possible to fly to Brussels from London *via* Paris.

The other service, using a Farman Goliath, will only operate once a week. Every Friday the machine will leave Hounslow at 10-30 a.m., taking passengers to Le Bourget, where a motor-car will meet them at 1 p.m. and convey them to the Ritz Hotel in Paris. The return journey will be made on Thursdays under similar conditions. The Goliath will carry twelve passengers, and the single fare is £15 15s.

During the week ending Sept. 19th the Handley Page machines conveyed between London and Paris 30 passengers and 1,014 lb. of freight and luggage.

The following are the Airco Services to and from Paris for the past week.

Date.	Type and Pilot.	Hounslow to Paris	Paris to Hounslow	Pass.	Weather.
Sept. 15th	D.H. 9 (Lt. Square) ... (special machine)	9 a.m. 11.45 a.m.	... ...	2 ...	
	D.H. 4a (Lt. Shaw) ...	12.39 p.m. 3.0 p.m.	... ...	1 ...	
	D.H. 4a (Lt. Lawford)...	...	12. 0 p.m. 3.27 p.m.	... ...	
Sept. 16th	D.H. 16 (Lt. McMullin)	12.34 p.m. 2.50 p.m.	... ...	2 ...	
	D.H. 9 (Capt. Riley) ...	...	12.50 p.m. 3.7 p m	... ...	
Sept. 17th	D.H. 4a (Lt. Powell) ..	12 30 p.m. 2 45 p.m.	... ...	2 ...	
	D H. 4a (Lt. Shaw) ...	...	12.30 p.m. 2.45 p.m.	1 ...	
Sept. 18th	D.H. 16 (Capt. Baylis)..	12.39 p.m. 2.45 p.m.	... ...	3 ..	
	D.H. 9 (Lt. Square) ...	...	12.30 p.m. 3.0 p.m.	2 ...	
Sept. 19th	D.H. 4a (Lt. Campbell Orde)	12.33 p.m. 2.30 p.m.	... ...	2 ...	
	D.H. 16 (Lt. M Mullin)	...	12 30 p.m. forced landing at Bahot	..	Very bad. Rain. Low Clouds. Strong wind.
Sept. 20th	D.H. 9 (Lt. Shaw) ...	12.33 p m. 2.45 p.m.	... ...	... ...	
	D.H. 4a (Capt. Baylis)...	...	12.30 p.m. 2.46 p m.	... ...	

The Airco D.H.16 machine, which left Paris on Sept. 19th and was forced to land at Bahot, near Marquise, owing to oil-pressure trouble, contrived to leave France on the morning of the 20th. Assistance having been obtained from Marquise Aerodrome, the machine left Bahot at 10.40 a.m. and arrived at Hounslow at 11.15 a.m. There were no passengers aboard.

The specially-chartered D.H.9, which flew to Paris on Sept. 15th, carried two Spanish noblemen, namely, the Marquis Pons and the Marquis del Rio.

A Month's Work.

The following letter from "Aircraft Transport and Travel, Ltd.," dated Sept. 20th, 1919, is of more than usual interest:—

Sir,—I am writing, on the completion of the first month of our aeroplane service between London and Paris, to thank you for the publicity you have given this the first daily commercial air service, and to express gratitude, specially, for the manner in which you have drawn attention to the fact that, in spite often of extremely bad weather, we have maintained our service, day in and day out, to scheduled time.

I started this service on Aug. 25th to demonstrate to the business world, by actual daily flying, that aeroplanes will not only transport passengers and goods at 100 miles an hour, but will do so commercially to a fixed time-table.

It should interest your readers, I think, to have before them a summary of our achievement during this first month, when we have demonstrated day by day the fact that, for the first time in the history of mankind, London and Paris are, by "air express," only 2¼ hours distant from each other.

Here, summarised, is the record of which, I think, we may be proud. Out of a possible 56 flights between London and Paris during this first four weeks, we have satisfactorily completed 54. On one occasion, when there was a 100-miles-an-hour hurricane, it was considered advisable to divert the load of a machine to an alternative route; and on another occasion, after starting a flight rather late owing to atrociously bad weather, a pilot had a forced landing through oil-pressure trouble, which so delayed him that he considered it unadvisable to proceed owing to the impending darkness.

As showing the dependability in operation which can be attained already with a suitable aeroplane, when handled with skill, I should like to emphasise the point that only twice, during 13,750 miles flying, has it been necessary for a pilot to make a compulsory descent; and in one of these two cases, after five minutes' delay, he was in the air again.

I have been asked why I chose London-Paris as a demonstration route, seeing that the weather encountered is probably the worst in the world. My reply is that we chose this route deliberately. We were confident of our pilots and machines. We knew the belief which is prevalent that commercial flying is only a fair-weather proposition. We said to ourselves, "If we can fly reliably on this route we can go with confidence anywhere else in the world."

In the month's weather we *have* just flown through, the official reports show that on only three days were conditions really favourable. On thirteen days they were distinctly unfavourable, while on eight days, though our machines actually got through, the official reports showed that the conditions were considered "unfit" for flying.

The credit for this month's really wonderful flying, which has done more than anything else has ever done to convince thinking people that the era of commercial flying has already dawned, is due entirely to the ex-Royal Air Force officers and pilots who, under my direction, have organised and flown this service.

In their capacity as indefatigable organisers, I pay sincere tribute to Brig.-General F. L. Festing, C.B., C.M.G., who resigned his post as Deputy Master-General of Personnel at the Air Ministry to join me as managing director of Aircraft Transport and Travel; also to Capt. D. M. Greig, O.B.E., late of the Department of Aircraft Production; and last, but far from least, I pay tribute to those pilots—the finest, I am convinced, in the world—who have flown through weather which even experts have considered impossible.

To these pioneers of commercial flying—to Capt. Baylis, Capt. Riley, Lieut. Shaw, Lieut. Lawford, and Lieut. McMullin—we owe a debt of gratitude it is hard to express in words. Their flying, their enthusiasm, their good judgment—these have been magnificent.

To the public, and particularly to the business community, I should like, if you will permit me, to say this. To use this 100-miles-an-hour service on urgent occasions when "time is money" is not only a sound business proposition—as those who are now using it daily would be the first to testify—but it is something far more than this. It is a definite encouragement to British aviation; which, first as it was in war, is now faced with the task of maintaining that proud position during the days of peace—a task which it can only hope to accomplish by the interest and support of the public.

(Signed) J. Holt Thomas, Chairman.

The London-Brussels Air Service.

Handley Page, Ltd., would have started their London-Brussels service on Monday, Sept. 22nd, but the weather

was unfavourable. The machine started at 8 a.m. on Sept. 23rd. The same type of twin-engined machine is used on the service as on the London-Paris route. There is accommodation for 10 passengers with 30 lb. each of personal luggage, and, in addition, for 500 lb. of freight.

The seats are all numbered, and can be booked at all the usual agents or at the Cricklewood aerodrome. Private motor-cars await the passengers at each aerodrome and convey them to the centres of the cities. The machines start from Hounslow at noon on Mondays, Wednesdays, and Fridays, and return on the alternate days.

LONDON.

AN M.P.'S AEROPLANE.—Sir Philip Sassoon, M.P. for Hythe, has bought an Avro biplane. He intends to use the machine for flying from London to his residence near Lympne. Three-quarters of an hour will be saved over the time taken by the fastest train on the journey.

HENDON.—A B.A.T. F.K.26 passenger-carrier, piloted by Major C. Draper, arrived at Hendon on Sept. 21st from the Amsterdam Exhibition. Later in the day another B.A.T. machine of the same type also arrived at Hendon from Belgium.

The former during its stay in Holland made many flights, one including a flight over the house at present occupied by the Crown Prince of Germany, who, it is stated, watched the machine from his garden.

HOUNSLOW.—The variable weather of the past week seems to have affected the number of Avro flights at Hounslow. In course of time Londoners will doubtless realise that autumn flying can be just as enjoyable as going aloft during an August heat-wave. In fact, a clear morning with a touch of frost may give a far finer view than one gets when a summer haze hangs over the earth, and few things can equal the delights of flying on a bright snowy morning. But the holiday spirit seems to wane with the passing of summer, and in consequence only 120 Londoners made flights during the week.

Two cross-country return journeys were made to Stow-on-Wold and to Cambridge, and three aeroplanes arrived by air from Manchester during the week.

One of these machines was taken by Capt. Bradley to Lausanne. He left Hounslow on Wednesday, Sept. 17th, at 2.15 p.m., and arrived safely on the shores of Lake Geneva on Saturday, Sept. 20th. No attempt was made to break records. The Alps were safely crossed, and the journey was uneventfully successful. The Avro will give demonstrations at Lausanne and take up passengers under an arrangement with M. Pethoud.

BLACKBURN.

The Blackburn flying week opened at Witton Park on the afternoon of Sept. 13th. The first flight was made by the Mayor, and since then a great number of people have been taken up. The flying is under the direction of Lieuts. C. B. Maddocks and Kingsford Smith, M.C., who are both Australian pilots. They have both entered for the £10,000 prize offered by the Australian Government.

Sixty-five passengers were taken up on Sept. 15th, and two flew to Blackpool, where they alighted on the sands.

BRIGHTON.

Flying was only possible on six days. One of the Avros at this place took some visitors to a garden party at Reigate on Saturday, Sept. 20th. The machine went over to Chichester on Thursday as usual and took up passengers there.

GLASGOW.

According to the "Daily Chronicle" of Sept. 17th a regular air service is in operation between Glasgow and Gleneagles, a new golf course recently opened by the Caledonian Railway Company. In a preliminary flight one of the pilots covered the distance of about fifty miles in 25 mins. It is questioned if flying to the course will improve the play of the golfer or put him right off his stroke.

LEICESTER.

The Leicestershire and Rutland Aero Club are making plans for developing aviation in the Midlands if they obtain the necessary financial support. They propose to purchase one machine at first, which will be placed at the service of business men who wish to make commercial journeys.

LLANELLY SANDS.

At an inquest on Sept. 20th it was stated that David Watts was driving a pony and trap giving pleasure rides to children on the beach when he got in the way of an aeroplane and was struck on the head by one of the wings and killed. Three children in the trap were also injured.

A verdict of "Accidental death" was returned, and the jury recommended that the course of the aeroplane in rising from the starting-point should be fenced off.

SHEFFIELD.

The tramway strike greatly interfered with the success of Sheffield's second flying week at the Coal Aston aerodrome, and necessitated a modification of the arrangements, but the facilities for flying were not removed. The exhibition flights did not take place, but the arrangements for public flights held good. There were four Avro machines on the ground. The difficulty in the way of making ascents was that of reaching the aerodrome.

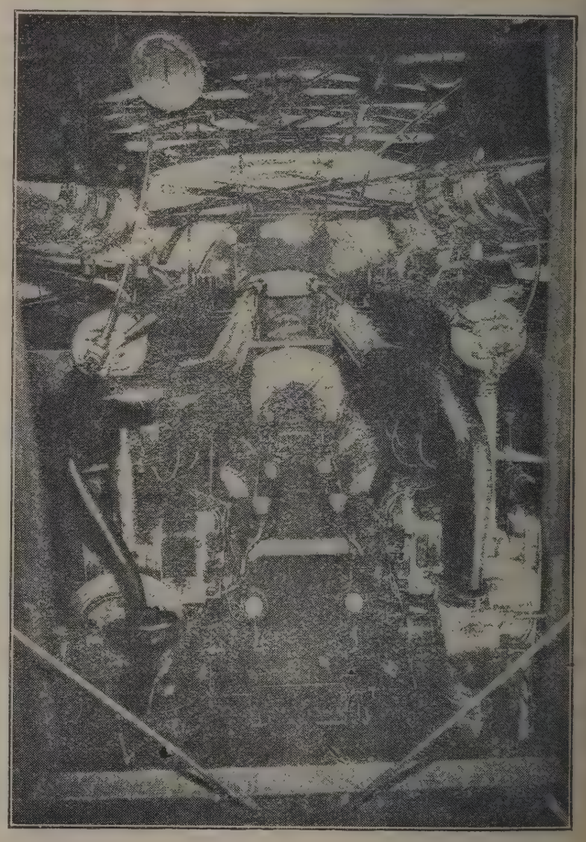
On Sept. 15th there was no attendance of the general public, and no short flights were made. One passenger, however, showed interest in longer-distance flying by going to Scarborough.

WESTON-SUPER-MARE.

Drifting sand borne on a westerly gale which resembled a sand-storm, coupled with intense cold, kept visitors off the sands for three days and spoilt the flying. Two days were completely spoilt by the weather, and there were very few trippers on the sands after Tuesday. Thus a week which promised well at the outset was completely spoilt by the weather.

WINDERMERE.

This week has been a record for the number of passengers carried at Bowness. The Avro seaplanes have carried out 32 flights, totalling nine hours of flying.



One sporting couple engaged a machine for a half-hour flight over Ulverston and Morecombe Bay, and from a height of between 3,000 and 4,000 ft. they enjoyed some especially splendid views of cloud effects.

AUSTRALIA.

THE PLANS FOR DAILY AIR SERVICES.

The first aerial transport company has been formed in Australia under the name of "Aerial Transport (Limited)." The company intends to start at once on the preliminary work necessary before an actual flying service can be put in operation.

Surveys will be made of routes over which the machines will fly, aerodrome sites will be established, meteorological information obtained and tabulated. The possibility of the local manufacture and repair of machines and engines will

The Engine-room of the Linke-Hofmann R.2 Machine described in "Aeronautical Engineering."

be investigated. The shares of the company are divided among all the States, and it is expected that actual flying services between the capital cities will be in operation by July, 1920.

It is expected that the service, which will not be confined to inter-capital routes, will open up the interior of the Continent now shunned on account of the lack of travelling facilities. It will provide quick transport for perishable goods, and the company eventually hopes to carry the inter-State mails.

It is proposed to establish aerodromes in Sydney, Melbourne, Brisbane, Perth, Adelaide, Launceston, and Hobart. The average passenger fare between capital cities will be less than £6 each way. The first daily services will all start from Melbourne and will be run to Sydney (6½ hours), Adelaide (5½ hours), and Hobart (7½ hours).

The other proposed daily services are between Sydney and Brisbane (6½ hours), Sydney and Adelaide (11 hours), Melbourne and Broken Hill (7 hours), and Adelaide to Kalgoorlie and Perth (18 hours). Other services will subsequently be developed in the various States between the capital cities and the larger country towns.

The machines which it is proposed to use will have a capacity of three tons and a quarter, and will be able to carry 30 passengers, with 25 lb. or 30 lb. of luggage each. In the alternative they will carry 12 passengers and two tons of freight or mail. Freight could be carried at the rate of 8d. per lb. It is suggested by the company that, with the co-operation of the Postal Department, it would be possible to carry the mails at an extra charge of ½d. per oz. for letters requiring urgent delivery.—W. J. A.

NEWS FROM AUSTRALIAN SOURCES.

Mr. Sydney Pickles, of Sydney, has arrived in New South Wales with a model of an aeroplane with which he intends to display the possibilities of commercial flying in Australia. He has arranged for the shipment of some machines to Sydney. One of them has a speed of 158 miles an hour.

According to the Exchange Telegraph Company Flt.-Lieut. McGinnes Fysh has been commissioned to survey an aerial route in the northern territory of Queensland in connection with the forthcoming Handley Page trial flight to England.

BRAZIL.

Handley Page, Ltd., have received the sole contract for carrying mail over all routes in Brazil, according to a telegram from Rio de Janeiro.

EGYPT.

THE INDIAN MAIL SERVICE.

It has been found necessary to postpone the inauguration of the Cairo-Karachi air-mail service. There are not sufficient commercial prospects to justify the expense of starting it.

Recently a survey party crossed the desert in cars from Damascus to Abu Kemal, on the Euphrates, and thence to Baghdad. Landing-grounds were marked out at intervals of 20 miles en route.

FRANCE.

The French Government has decided to give a series of annual premiums or subsidies in aid of civil aerial transport enterprises. Premiums of the following classes will be given: (A) Depreciation, (B) Equipment, (C) Transport, (D) Military.

The regulations can be summarised as follows:—

(A.) The Depreciation premium.

If P be the price of the aeroplane without motor, p the price of the motor, and assuming that the flying life of the aeroplane is 400 hours, the formula of hourly depreciation is as follows:—

$$\frac{P \times 1.5p}{400}$$

It is assumed in this formula that the life of the engine is about one and a half times more than that of the aeroplane.

The State will pay—

(1) To firms maintaining a regular transport service over a fixed itinerary between two points not less than 124 miles apart, half of the hourly depreciation, i.e., 0.00125 (P+1.5 p).

(2) To firms maintaining a regular transport service over a fixed itinerary between two points not less than 31 miles apart, or constituting a closed circuit of at least 62 miles without a landing, and to firms maintaining a regular service of less than 124 miles in length, a quarter of the depreciation costs, i.e., 0.000625 (P+1.5 p).

(B.) Equipment premium.

To firms of category 1 shown under Section A, the State will pay 0.10 a kilometre for the length of the mean stage flown without landing, and 0.05 a h.p., i.e.,

$$0.10 \times \text{length of mean stage} + 0.05 \text{ H.P.}$$

To firms of category 2 the State will pay 0.10 a kilometre and 0.025 a h.p.

(C.) Transport premium.

This premium is proportional to the customary speed V of the aeroplane shown at official trials, to a speed v.V.50, to its useful tonnage capacity expressed in tons (700 kilog. = 0.7) and a coefficient K, i.e.,

$$\frac{K}{100} \times V \times v \times T$$

The coefficient K varies according to the nature of the enterprise. For firms in No. 2 category, K equals zero, and for regular international services K equals 14. In such advanced efforts as services in Central Africa K can rise as high as 19.

[This is not very clear, but it is taken literally from "L'Auto."—ED.]

(D.) Military premium.

A supplementary depreciation premium is given in the case of all machines which have military value. This premium is equal to a quarter of the depreciation, i.e., 0.000625 (P+1.5 p).

Note.—The number of hours of flight is calculated on the distance covered on the fixed route at a fixed speed of 130 kilometres an hour

THE PARIS-MELBOURNE FLIGHT.

Some time during the present week M. Etienne Poulet hopes to begin his flight from Paris to Melbourne on a twin-engined Caudron biplane. The journey will be attempted via Rome, Salonica, Constantinople, Bagdad, Karachi, Bombay, Calcutta, Bangkok, Singapore, Batavia, Rotti (an island S.W. of Timor), Sydney, and Melbourne. Should he reach Melbourne safely he will attempt to return to France by way of the air. M. Poulet, who has been given but little encouragement by the French Government, states that the British Government have offered him any assistance which can be obtained from the British preparations for the England-Australia flight. He will be accompanied by his mechanic, Benoit.

MESSRS. FARMAN AND MOTOR-CAR CONSTRUCTION.

It is rumoured in Paris that the Farman Bros. intend to construct and sell six-cylinder motor-cars of the most modern and perfect type. The price will be between £1,500 and £1,700 for the chassis. Even in France man cannot live by aviation construction work alone.

THE RETURN OF THE GOLIATH.

Lieut. Boussotrot, his companions, and the remains of the Farman biplane Le Goliath reached Marseilles on Sept. 14th from Saint Louis, Senegal.

THE CIVIL USE OF MILITARY AERODROMES.

It is now possible for civil aircraft, both private and commercial, to make use of military aerodromes in the course of cross-country flights. The charges officially authorised are as follows:—

For a day, from sunrise to sunset, 0.02 centimes per unit of horse-power.

For a night, from sunset to sunrise, 20 francs.

Aeroplanes fitted with wireless installations pay one franc in the case of those having either a sending or receiving set, and two francs when a sending and receiving set is installed.

BIARRITZ-SAN SEBASTIAN.

The Compagnie des Transports Aeriens du Sud-Ouest has organised a daily aerial passenger service between Biarritz and San Sebastian. The aeroplanes used are Farman biplanes (type F.40).

AERODROME RESTRICTIONS REMOVED.

Issy-les-Moulineaux, the historic scene of many of the early tragedies and comedies of aviation, has now, under the orders of General Duval, the Director of Military Aeronautics, has been opened to the public, who may walk freely over its area. "L'Auto" is amused, and says that the innocent civilian may now permit himself to be killed by an alighting aeroplane without breaking any law. In truth the arrangements at Issy have always been unsatisfactory. When I was working there nine years ago, people walked freely over the ground while ambitious pupil-aviators gambolled lightly over the soil in their cumbrous machines. On one occasion public ardour was damped by the premature death of a woman, old in years, who was accidentally distributed by a descending aeroplane while she was dreamily crossing the landing-ground on her way home. But public recklessness soon returned.

EXPLOITATION ABROAD.

The celebrated French aviator Gaubert is leaving for the U.S. of America with a view to developing French interests in civilian aviation in that country. He is taking out with him a Farman four-seater limousine.

M. Tadhomme has left for South America with the same object. If the results are favourable a Farman "Goliath" will be sent out to attempt some long-distance flights in the States.

GERMANY.

Recent discussions between German and foreign firms are likely to lead to Germany's participation in the International Air Post Service in the near future. In a fortnight a regular air postal service between Berlin and Copenhagen is expected

to begin, and negotiations with the other Scandinavian countries are proceeding.

An important part of the service will be the conveyance of aerograms to relieve the telegraphic service. The air post service in Germany is at present restricted owing to the extreme shortage of petrol.

MORE ZEPPELIN AIRSHIPS.

According to a telegram from Romanshorn, Zeppelin airships are still being built, which is in contravention of the Versailles Treaty. The latest types will be able to travel from Berlin to Friedrichshafen (400 miles) in four hours, carrying thirty-eight passengers with light luggage.

HOLLAND.

A Farman "Goliath" left Utrecht for Paris on Sunday morning with passengers, piloted by Lieut. Krause Jensen. A landing was made in time for déjeuner in Paris.

ITALY.

THE ROME-TOKIO FLIGHT.

On Sept. 16th, in consequence of Maggiore d'Annunzio's abrupt entry into the political world by his capture of Fiume, the Italian Government cancelled the arrangements for the Rome-Tokio flight. The Government had proposed to give £160,000 as a grant in aid towards the expenses of the flight.

The Italian correspondent of THE AEROPLANE writes :—

Some two or three specially-constructed Caproni biplanes were to take part *on dit* in the Rome-Tokio flight. It seems probable that their part was the useful one of carrying spare motors and fuel supplies to inaccessible spots from the main bases. When one imagines what the cost of these large transports is—"Il Cielo" says half a million lire in war trim—it is easy to see how the flight is reported to have been subsidised to the extent of four millions by the far-seeing Italian Government.

THE CIRCUIT OF SICILY.

Lieut. Berardi, on Macchi 9, carried off the Targa Florio and most of the other awards in the Circuit of Sicily race by getting round that island in 5 hours 16 min., just beating Cattaneo—not he of Blériot acrobatic fame—on a Macchi 5 scout by 6 sec., and Lt. Berlingeri, also on a Macchi 5, by 9 min. The fourth man in flew an F.B.A. The only Macchi 8 did not finish the race, and only one of the G.Ls. (flown by the two French officer entrants) arrived at the goal, and that last but one of the 18 survivors of the 27 brave flying boats that started out in the fairest of weather. Only the Macchi 5's were single-seaters.

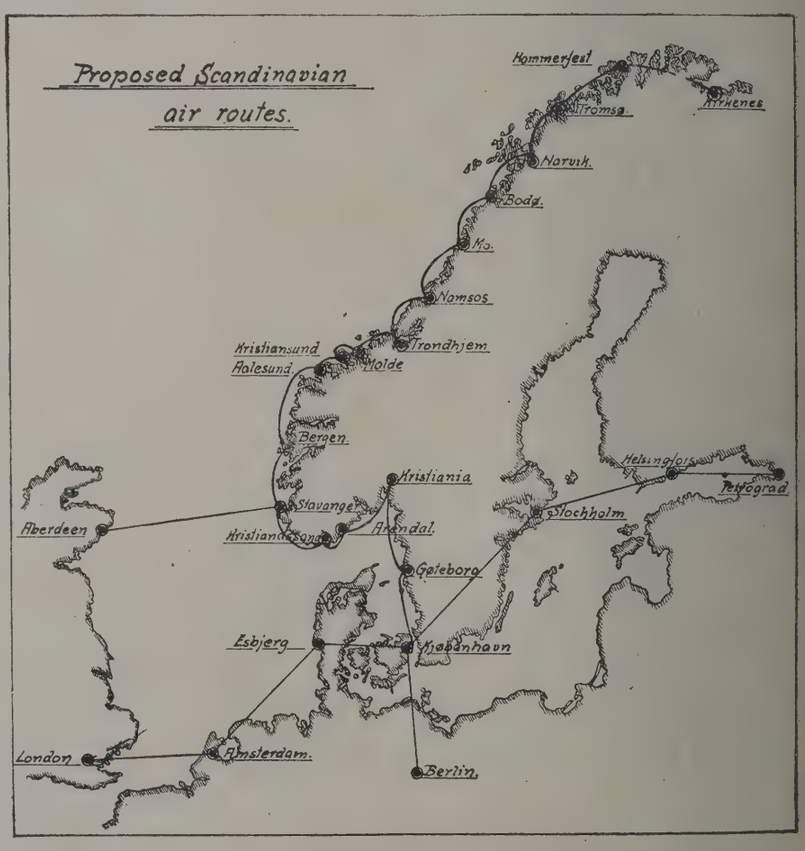
The affair seems to have been beautifully handicapped and organised most thoroughly, as one would have expected in anything done by the Sicilian Automobile Club cum Chev. Florio plus the Naval people. A number of the machines were piloted by A.B. seamen, and Manissero judged the finish. Quite a goodly number of money and other prizes were provided by firms, societies etc., as an act of gratitude to Sicily's coastal defence corps.

A NEW AIRSHIP.

A very large dirigible is about to begin its trials—in all senses probably—at Ciampino. Interviewed about it, Signor Usuelli stated that the new feature of the airship was its excess of h.p., which is something like four times that normally required for flight. A speed of 56 m.p.h. is expected, and it is hoped to make a voyage from Italy to the Argentine.

One presumes that Signor Usuelli's co-operation in the Government drawing offices portends some of his principles being adopted in the new vessel.

Another account states that the four-engined airship, the T.34 has a cubic capacity of 36,000 cms., a length of 100 metres, and a diameter of 30 metres, together with accommodation for 100 passengers, excluding the crew.



SCANDINAVIA.

THE PROPOSED AIR ROUTES.

The Danish correspondent of THE AEROPLANE writes :—

The accompanying map shows the principal Scandinavian air routes, to be run by the Norwegian, Danish, Swedish and Finnish aerial navigation companies. It will be seen that both Denmark and Norway will desire co-operation with Great Britain on their North Sea lines, and will enter probably into negotiations with such enterprises as Mr. Holt Thomas' Aerial Travel and Transport Co., and/or Mr. Stuart Hirst's The North Sea Aerial Navigation Co.

The routes indicated lend themselves to the following reflections. The line starting from London to Petrograd will have to await affairs being settled in Russia before its inauguration. Copenhagen is, from its position, likely to become the crossing centre of the various lines, including the one from Christiania over Gothenburg to Berlin. The local Norwegian aerial service along the coast is likely to be the first one to be established, as the flying times should compete favourably with the time-tables of the present steamer services. As a matter of fact, the aeroplane did step in last year, when the railway failed temporarily, owing to the washing-out of embankments by heavy rain, as the British-trained Norwegian, Lieut. Riiser-Lassen carried the mail to the city of Trondhjem on a Morane monoplane with a Thulin rotary motor.—HI.

UNITED STATES OF AMERICA.

A NEW YORK-SAN FRANCISCO AIR SERVICE.

The following is "communicated" from America :—

The Lawson Airline Transportation Co. of Milwaukee, Wisconsin, has just completed the first of its big passenger-carrying aeroplanes. This machine is fitted with two 12-cylinder 400 h.p. Liberty engines, which give it a speed of 90-100 m.p.h. If one engine stops the other has sufficient power to keep the biplane in the air. The gliding angle of the machine is so flat that it is claimed that it can glide 30-40 miles from a height of 15,000 ft., the ceiling.

Half the fuselage has been made into a large cabin to hold 26 passengers in comfortable armchairs. Recently the machine was taken to the Milwaukee aviation field, where it was tested. It was arranged that it should make a path-finding tour between Milwaukee, Chicago, New York, and San Francisco. Those cities en route which had the best landing-grounds and desired an air service would probably be selected as the first stations on the airline between the Atlantic and Pacific Oceans.

Mr. Alfred W. Lawson, the designer of the machine, is to be the captain in charge on the first flight. The two pilots who fly the machine will afterwards be put in charge of similar aeroplanes as captains. The crew to be carried in each machine consists of two mechanics. The Lawson Company intend to build one hundred aeroplanes of this type in the next few months which will be used on a regular daily service between New York and San Francisco.

AIRCRAFT FINANCE

THE MENACE OF ECONOMY.

When dealing a couple of weeks ago with the probable effect of the Government's "saving scheme" on the economic fabric of the Aircraft Industry, there was no attempt at exaggeration. The daily Press has now been howling, but, unlike Cæsar's wife, its intentions may not be altogether above suspicion.

He would indeed be an optimist who could discover the silver lining of the policy now adumbrated by the authorities. Perhaps it is no worse than was looked for. Financially, however, the consequences may prove very serious, unless, of course, something unexpected turns up.

Not being the plaything of amateurs, but a business proposition, the Aircraft Industry cannot exist or thrive on expectations. Hope is useful, but as an asset in a balance-sheet it would be refused by any competent auditor, and the auditor would be fully justified in his action. But in following on the lines of Oliver Twist and asking for more Government support the Industry is not gluttonous; on the contrary, it is demanding justice without any ulterior political motives.

AN ILLUSTRATION.

Not many months ago Aircraft Manufacturing Preference shares were commanding a price of 27s. in the case of the "B" Participating and practically 25s. in the case of the Cumulative "A" shares. Now they are worth about 13s. 6d. A sum in simple arithmetic illustrates very convincingly what this represents. The authorised capital is £402,500, of which £100,000 is in 7 per cent. Preference shares, £250,000 in "B" shares, £50,000 in Preferred Ordinary shares of £1 each, and £2,500 in 1s. Deferred shares. The depreciation in the case of the two shares specified approaches a quarter of a million, and, of course, the valuation of the other must have suffered just as much, if not more.

PLAIN ARGUMENTS.

Perhaps the illustration is somewhat crude and amateurish, but it serves the purpose. Perhaps the "B" shares were not intrinsically worth anything like the high price taken into the calculations. It is debatable, too, whether the present price is reasonable. But, of course, if one pursues this line of argument it is impossible to reach any but a negative conclusion. The fact is that the prices mentioned actually ruled at one time. Had it been suspected that the authorities would abandon their petted and useful foundling so soon as its utility ceased to be pressing, the chances are the higher prices would not have been established. All the propaganda of the Government at that time served to mislead the investor, who, not unnaturally, concluded that equitable treatment would be accorded to the Industry, not for an indefinite period, but until it had time to get on its feet. It is not a key industry, apparently. Unfortunately, the blame is not solely with the authorities in this connection; there were others who, either unreasonably optimistic of the immediate prospect of aviation, or unscrupulously exaggerating the position for their own profit, contributed towards the result.

REACTIONS PRODUCE REACTIONS.

It is plain that the immediate prospects of the Industry are vague, and this must be reflected seriously upon the financial position. The financing of newer plans—and the Industry still being in its infancy, newer plans must be reckoned with—is likely to prove difficult as well as costly. One thing, however, is certain, and that is, aviation having proved its capabilities to the advantage of the nation at war, the nation must be prepared to contribute something towards its sustenance, and the degree of help will be enlarged as soon as the panicky economy plan has spent its force and reason takes the reins.

No one denies that there is plenty of scope for genuine economies in the nation's bill; in the case of aircraft it has been not altogether misdirected, perhaps, but so ruthless as to produce a reaction in time.

Incidently Handley Page Participating Preference shares have been selling about 12s. 6d. It was only in April last that the public was offered these for subscription at 21s. What a change in such a short time! Yet it would be unwise to jettison shares in a fit of panic.

CURRENT TOPICS

THE BANKRUPTCY COURT.

In the case of Luc Marie Dartois, company director, Finchley, the statement of affairs shows liabilities £589 and assets £12. The debtor, a Belgian, was concerned with others in the promotion of the Aeroplane and Motor Bodies Co., Ltd. He was secretary and director at a salary of £3 a week, which was subsequently increased to £17 a week. At first the company was successful, but subsequently went into voluntary liquidation. The debtor guaranteed an overdraft to the extent of £1,400 and had also guaranteed a loan from a moneylender which was borrowed for the purpose of the business of the company, and it was in respect of that liability that bankruptcy proceedings had been taken. He ascribed his position to the failure of Aeroplane and Motor Bodies, Ltd., and states that he first became aware of his position when the company decided to go into liquidation, and since that time he has not contracted any debts. The creditors are Harris, B., £70; Denton, Hall and Burgin, £20; Tom, Mols, Oppenheimer and Kryn, Antwerp, £400.

WHITEHEAD TRUST.

The Whitehead Trust, Ltd., has been registered Sept. 15th with a capital of £2,000 in 1,000 "A" shares of £1 each and 10,000 "B" shares of 2s. each, to acquire from the Exchange Press, Ltd., of 222, Strand, W.C., for £500 in "B" shares, certain collated documents, being information regarding Whitehead Aircraft (1917), Ltd., and to carry on the business of financiers, promoters, etc. The vendors are also to receive £75 in "B" shares or cash in part payment of preliminary expenses. Minimum cash subscription, 7 shares. The first directors are: J. E. Brockelsby, 212, Northumberland Park, Tottenham, N., accountant; D. Hyman, 58 Vassall Road, Brixton, S.W., theatrical manager; J. N. Firth, Elm Cottage, Stoke Mandeville, Bucks. Registered office, 222, Strand.

NEW COMPANIES.

COMMERCIAL AEROPLANE WING SYNDICATE, LTD.—Private company. Registered Sept. 10th. Capital £30,000 in £1 shares. To take over from A. A. Holle, of 19, Half Moon Street, Piccadilly, W., an invention for improvements in aero-foils for aeroplanes and the like, and to enter into an agreement with A. A. Holle and the Varioplane Co., Ltd. (vendors). The subscribers (each with one share) are:—A. A. Holle, 19, Half Moon Street, Mayfair, W., gentleman; A. G. Morrish, 34-6, Gresham Street, E.C.2, C.A. The Varioplane Co., Ltd., may appoint three directors, and the Blackburn Aeroplane and Motor Co., Ltd., may appoint two. Secretary: A. S. Wigglesworth. Registered Office: 34-6, Gresham Street, E.C.

THE FIRST AIRCRAFT BROKERS.

The Lep Transport and Depository, Ltd., the proprietors of the Aerial Travel Office in Piccadilly Circus, have now opened a temporary office at the Hounslow aerodrome as the first aircraft brokers in the world. The functions of the office are similar to those of a shipbroker, i.e., the clearance of incoming and outgoing aircraft and their cargoes through Customs, for which a scale of inclusive charges has been compiled. Mr. R. A. Loader, who is in charge of the new department, will give every assistance to civil air transport firms and their pilots both in regard to customs formalities and the handling of freight as well as the booking of passengers.

ROYAL AERO CLUB NOTICES.

SPECIAL COMMITTEE MEETING.

A Special Meeting of the Committee was held on Friday, September 5th, 1919, when there were present:—Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S. (in the Chair), Lieut.-Col. Spenser D. A. Grey, D.S.O., Mr. F. Handley Page and Mr. Harold E. Perrin (Secretary).

HONORARY MEMBERSHIP:—The following were elected Honorary Members of the Club:—Lieut.-Col. James E. Chaney (U.S Air Service), Capt. Harold M. McClelland (U.S. Air Service).

THE FLYING SERVICES FUND.

A meeting of the Flying Services Fund Committee was held on Friday, September 12th, 1919, when there were present:—Group Capt. C. R. Samson, C.M.G., D.S.O., R.A.F. (in the Chair), Mr. Chester Fox, Squadron Leader T. O'B. Hubbard, M.C., R.A.F., and Mr. Harold E. Perrin (Secretary).

GRANTS AND ALLOWANCES.—The following Grants and allowances were made:—

(32) A Grant of £5 to the widow of an Ex-1st Class Air Mechanic in the Royal Flying Corps who died as a result of exposure whilst on active service.

(40) An allowance of £2 a month for six months to the widow of a Sergeant in the Royal Flying Corps killed on active service.

(70) An allowance of £1 a month for six months to the mother of a 2nd Class Air Mechanic in the Royal Flying Corps who died on active service.

(91) An allowance of £4 a month for six months to the widow of a Sergeant in the Royal Flying Corps killed on active service.

(109) An allowance of £2 a month for six months to the widow of a Private in the Royal Flying Corps who died on active Service.

(118) An allowance of £4 a month for three months to the mother of a 3rd Class Air Mechanic in the Royal Air Force killed on active service.

(126) An allowance of £2 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Flying Corps who died on active service.

(128) An allowance of £2 a month for six months to the mother of a Sergeant in the Royal Flying Corps killed on active service.

(130) An allowance of £2 a month for six months to the mother of a Private in the Royal Flying Corps who died on active service.

(139) An allowance of £3 a month for six months to the widow of a 3rd Class Air Mechanic in the Royal Air Force who died on active service.

(146) An allowance of £2 a month for six months to the widow of a 1st Class Air Mechanic in the Royal Air Force who died on active service.

(150) A Grant of £5 to the widow of a Private in the Royal Flying Corps killed on active service.

(152) An allowance of £2 a month for three months to the widow of a 2nd Class Air Mechanic in the Royal Flying Corps killed on active service.

(155) An allowance of £2 a month for six months to the widow of a 1st Class Air Mechanic in the Royal Air Force killed on active service.

(160) An allowance of £2 a month for six months to the sister of a 3rd Class Air Mechanic in the Royal Naval Air Service killed on active service.

(176) An allowance of £2 a month for six months to the widow of a Driver in the Royal Air Force who died on active service.

(208) An allowance of £4 a month for six months to the mother of a Cadet in the Royal Air Force who died on active service.

(228) An allowance of £3 a month for six months to the widow of a 1st Class Air Mechanic in the Royal Naval Air Service who died on active service.

(244) A Grant of £10 and an allowance of £1 a month for six months to the widow of a Corporal in the Royal Air Force who died on active service.

(245) An allowance of £1 10s. a month for six months to the widow of a 1st Class Air Mechanic in the Royal Air Force who died on active service.

(246) An allowance of £2 a month for six months to the widow of a 1st Class Air Mechanic in the Royal Air Force who died on active service.

(247) An allowance of £2 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Air Force who died on active service.

(248) An allowance of £4 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Air Force who died on active service.

(249) An allowance of £2 a month for six months to the mother of a 2nd Class Air Mechanic in the Royal Air Force who died on active service.

(250) An allowance of £2 a month for six months to the widow of a Private in the Royal Air Force who died on active service.

(257) An allowance of £1 a month for six months to the widow of a 3rd Class Air Mechanic in the Royal Air Force who died on active service.

(260) An allowance of £2 a month for six months to the mother of a 1st Class Air Mechanic in the Royal Air Force who died on active service.

THE FLYING SERVICES FUND.

(Registered under the War Charities Act, 1916.)

ADMINISTERED BY THE ROYAL AERO CLUB.

For the benefit of Officers, Non-Commissioned Officers and Men of the Royal Air Force who are incapacitated while on duty, and for the widows and dependants of those who are killed or die from injuries or illness contracted while on duty.

HONORARY TREASURER.—The Right Hon. Lord Kinnaird.

COMMITTEE.—H.R.H. Prince Albert, K.G. (*Chairman*), Mr. Chester Fox, Squad. Leader T. O'B. Hubbard, M.C., R.A.F., Wing Commander C. E. Maude, R.A.F., Group Capt. C. R. Samson, C.M.G., D.S.O., R.A.F.

SECRETARY.—H. E. Perrin.

BANKERS.—Messrs. Barclays Bank, Ltd., 4, Pall Mall East, London, S.W.1.

SUBSCRIPTIONS:	£	s.	d.
Total Subscriptions received to Sept. 9th, 1919	15,119	19	1

SPECIAL COMMITTEE MEETING.

A Special Meeting of the Committee was held on Wednesday, Sept. 17th, 1919, when there were present:—Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S. (in the Chair), Mr. G. B. Cockburn, Lieut.-Col. Spenser D. A. Grey, D.S.O., Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie and the Secretary and Assistant Secretary.

JACQUES SCHNEIDER INTERNATIONAL SEAPLANE RACE.

The report of the Commissaires Sportifs was received and a telegram from Mr. Lorenzo Santoni, President, Societa Idrovolanti Alta Italia, lodging protest on behalf of the "Savoia."

The Secretary reported that Mr. Santoni had also requested the Aero Club of Italy to lodge formal protest with the Fédération Aéronautique Internationale, Paris.

ORGANISATION OF THE RACE.—A letter from Lieut.-Col. Spenser D. A. Grey, D.S.O., dated Sept. 15th, 1919, on the Club's organisation of the race was read. The organisation of the race was discussed at great length and the Committee considered that the arrangements were faulty. The Committee further considered the method of carrying out future competitions.

SPECIAL COMMITTEE MEETING.

A Special Meeting of the Committee was held on Monday, Sept. 22nd, 1919, when there were present:—Mr G. B. Cockburn (in the Chair), Lieut.-Col. Spenser D. A. Grey, D.S.O., Squadron Leader T. O'B. Hubbard, M.C., R.A.F., Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie and the Secretary and Assistant Secretary.

JACQUES SCHNEIDER TROPHY.

It was reported that the Aero Club of Italy had lodged a protest with the Fédération Aéronautique Internationale against the disqualification of Sr. Janello, the Italian representative, on the "Savoia," in the recent race at Bournemouth for the Jacques Schneider Trophy.

The Committee unanimously decided that although Sr. Janello did not actually complete the course as marked out for the race, the Royal Aero Club, as the holders of the Trophy, should recommend to the Fédération Aéronautique Internationale when the protest is heard, that the Trophy and Prize should be awarded to Sr. Janello, the Italian representative.

ROYAL AERO CLUB SEAPLANE COMPETITION.

It was further decided that the Royal Aero Club should offer a prize of £500 and Trophy, valued at £100 (kindly presented to the Club by Lieut.-Col. F. K. McClean) for an International Seaplane Competition to be held in the Solent and Southampton Water in the last week in October next. The conditions will be similar to those of the Schneider race, with the exception that the alightings on the water will be made after the course of 200 nautical miles has been completed.

The final regulations are now being drawn up and will be issued on October 1st, 1919.

Intending competitors are requested to communicate with the Royal Aero Club.

TECHNICAL AND COMPETITIONS COMMITTEE.

A meeting of the Technical and Competitions Committee was held on Monday, Sept. 22nd, 1919, when there were present:—Lieut.-Col. F. K. McClean (in the Chair), Squadron Leader T. O'B. Hubbard, M.C., R.A.F., Major R. H. Mayo, Lieut.-Col. Alec Ogilvie, Lieut.-Col. H. T. Tizard, Mr. Howard T. Wright and the Secretary and Assistant Secretary.

ROYAL AERO CLUB SEAPLANE COMPETITION.

The conditions for this competition were considered, and the Committee adjourned till Tuesday, the 30th inst.

PRESENTATION TO CLUB.

Mr. Hugh Lewis has presented to the Club a large framed coloured picture of Squadron 32 (D.H.2 Scouts), Royal Flying Corps, at Vert Galland Farm, France, Somme Battle, 1916.

AN AMBITIOUS PROJECT.

On Thursday Sept. 18th the Committee of the London Flying Club held a Press view of the club premises. At the concomitant lunch, Lord Louth, one of the vice-presidents, presided in the absence of Lord Lonsdale, and in a brief speech proposed success to the London Flying Club coupled with the names of Mr. and Mrs. Claude Grahame-White.

Mr. Grahame-White, who is the moving spirit of the club, set forth the general intentions of the committee. He related how in 1909, looking over the area which is now the London Aerodrome, he was struck by the idea of forming there a kind of super-Ranelagh-Hurlingham. The London Flying Club as it exists is, he explained, the beginning of the scheme.

In a general way the club is arranged on the lines of those American country clubs of which one has read so much in American fiction of late years. It is intended to be a social club at which the members can indulge in all forms of sport, including aviation. At present the aerodrome already exists and there are excellent hard tennis courts. It is the intention of the committee to add grass courts, a golf course, a polo ground, a swimming bath, squash-racket courts, and so forth and so on. Mr. Grahame-White added that his ambition is to have also a real ice skating rink, now that Princes' has become a motor garage. One trusts that the club will not become such a frost as to achieve this ambition automatically.

The Club House at present includes a large dining room, a lounge hall and over fifty bedrooms, and, as an annexe, a ballroom and concert hall in which well over 1,000 people could dance comfortably. This concert hall has a bandstand at one end and a stage at the other.

Interesting facts about the Club House are that it was built by Mr. J. S. Matthews, well known as a director of the Grahame-White Aviation Company, Limited; that all the woodwork in it (chairs, tables, balustrading, stairs, and so forth) was produced in the Grahame-White Aviation Company's works: and that the scheme of decoration was devised by Mrs. Grahame-White—possibly better known as Miss Ethel Levy. Undoubtedly Mrs. Grahame-White deserves to be highly complimented on her excellent taste in designing the scheme of decoration, which is striking without ever being disturbing. It gives an impression of cheerfulness and luxury, but never approaches a "jazz" effect. Similarly the Grahame-White works deserve to be congratulated on the excellence of their workmanship in the furniture and other woodwork. One is strongly under the impression that if the works turned out furniture of similarly high quality

as a standard product it would pay considerably better for the next year or two than making aeroplanes.

The building itself is very well designed and solidly built and has a pleasing rural outlook in every direction. The kitchen is in charge of a well-known *maître d'hotel*, formerly of Claridge's, and if the lunch given to the Press may be taken as a criterion of the catering for members in the future there will certainly be no cause for complaint in that direction.

It is the intention of the committee to hold occasional club dinners to which distinguished guests are to be entertained and club dances will be held frequently. In this connection for the first season a Hawaiian band has been engaged at considerable cost and one must confess that though it hardly accords with one's old-fashioned ideas of music, it is an immense improvement on the jazz-bands which have afflicted London of late.

Members who own aircraft can garage their machines in the club aerodrome and have them kept in running order. The club itself intends to keep certain passenger machines which members can hire at special terms either for pleasure flights or for real journeys. Sporting machines will also be available.

In the course of his speech Mr. Grahame-White said that he would be glad of constructive criticism. In this direction one would like to suggest that the colouring of the club motor-cars provided for the use of members be considerably modified. One can scarcely imagine a member of the best social set embarking at the Ritz in a vehicle which at once suggests an advertisement for somebody's famous blue.

It strikes one also that it is a mistake to offer membership of the club at half price to R.A.F. officers. One can scarcely imagine a London club of the better class offering a similar inducement to officers of H.M. Navy or Army, and still less can one imagine an officer of the better class accepting such an offer.

A still greater mistake is the idea of inviting officers who have had the honour to be awarded the Victoria Cross to free membership of the club. In the first place the winning of the Victoria Cross is not necessarily a guarantee of social standing, and in the second place an officer of the proper social status would scarcely relish the idea of becoming an honorary member because he had been decorated for valour.

Furthermore, public kinematograph pictures of the chief promoters of the Club performing antics in front of the Hawaiian band are scarcely likely to attract members of the most desirable class.

If the club is to be a social club of good class it will need no such adventitious aids to increase its membership. On the other hand, if it does not maintain a high social standing no amount of such temptation will attract people of the right class. As already said, the club has immense advantages as regards locality and surroundings and it may become precisely the kind of club which is extremely desirable in London to-day. The fact that Major G. B. Ollivant (late 12th Lancers) is the secretary gives one to hope that it will fulfil the functions for which it is intended. One wishes it precisely the success which it deserves.—C. G. G.

HULLO, BOLO!

To the Editor of THE AEROPLANE.

Sir,—So many people appear to be writing revues, which, according to the Press, can be done in five minutes, that I have attempted one myself, and send you herewith a typical scene. If your readers care for it (as I am sure they will), I can easily let you have the other 40 scenes, and a copy of the fees for acting, etc.

ACT I. SCENE I.

SCENE: Any room at the late Hotel Bolo.

TIME: Any time between 11 a.m. and 3 p.m., except the luncheon interval from 12 until 2.45 p.m. On second thoughts the time had better be 11.30 a.m.

(*Enter Chorus of O.B.Es.*)

CHORUS (singing in unison):

In us the representatives you see
Of beauty, splendour, power, and energy;
We none of us can fly,
And that's the reason why
We're Majors, R.A.F., plus O.B.E.

In beauteous Bolo blue we're not a shy lot;
In fact, we *have* been called a very "fly lot":
Our duty is quite clear,
We have to put the fear
Of God into the heart of every Pilot!

If left alone, we cannot fail to shine,
But sometimes some unmitigated swine
Says we've got to go o'ersea:
Then we take our remedy,
A new C.O.—and dose of chlorodyne!

Though *you* may think that over us are none
Who can be more exalted—"in the sun"—
E'en we must bow to rules
Laid down, 'tis true, by fools.
Hush, hush! Keep quiet! Here comes an S.O.1.!

(*Enter a Lieut.-Colonel, C.B.E., S.O.1.*)

All the O.B.Es. salute and stand to attention.

S.O.1: Methought I spied a fellow here with wings?

CHORUS (shocked): Oh, no, sir! No! How could you think such things?

1ST O.B.E. (picking up ruler and looking fierce):

If a Pilot I should spy,
He'd very quickly die
Of fright, before my eye!

(*Loud applause from Chorus.*)

S.O.1:

You're a bold man, I can see,
And when my time is free,
'Struth! I'll recommend you for the C.B.E.!

(*Terrific and prolonged applause. Telephone bell rings.*)

Ha, ha! There goes the bell!
Perchance 'tis Driver Nell,
With whom I hope to dwell
When (*picks up receiver and listens*)—
Flight Commander Blank? Oh, go to hell!

(*Throws telephone on floor.*)

2ND O.B.E.:

Perhaps, sir, you, being such a splendid specimen of Air Force beauty,
Could tell us how, much better than all other men, you do your duty?

(*Applause from all but the 1st O.B.E., who looks annoyed because he didn't think of this.*)

S.O.1 takes cigarette, lights it, and sits back on chair, with feet on mantelpiece. The O.B.Es. group themselves round in attitude of reverence.

S.O.1 (*after the "Vicar of Bray"*):

When I was a boy and wore long curls,
And velvet suits all braided,
I went to school with little girls,
And played with dolls as they did;
But when in 'fourteen came the war,
Though feeling such a draught, sir,
I joined the Royal Flying Corps,
Attached unto the Staff, sir!

CHORUS:

And this is a fact that I'll maintain
Whichever side has won, sir,
If we should have a war again,
I'll still be an S.O.1, sir!

At ten o'clock on every morn
I start my daily wrestle,
And exercise that brain and brawn
That brought me to the Cecil!
To every General I bow
In abject veneration,
With every Subaltern I row
And write for "explanation."

(Chorus.)

Soon doth the hour of noon arrive
To end the morning's duty;
Round to the Club for lunch I drive.
(My driver is a beauty!)
In this fine way the day's work's done
By brains there's no denying:
I earn my pay as S.O.1—
Let others do the dying!

(*Chorus, during which a bevy of W.R.A.Fs. enter and dance.*)

Enter a Messenger.

MESSENGER: Twelve o'clock, gentlemen!

Exeunt hurriedly.

And so on, ad infinitum.

K.

THE RETURN.

For the following story one has to thank the Johannesburg "Star":—

The aviator's wife was in tears. "What's the matter, my dear?" asked her friend.

"I'm worrying about George," she said. "He has been trying for a week to kill our cat, and as a last resource he took pussy up in his 'plane. He said he would take him up 2,000 feet and drop him over."

"Well, there's nothing to worry about," said her friend.

"Oh, yes there is," said the frantic woman. "George isn't home yet, and pussy is!"

CONGRATULATIONS.

ROE.—On Sept. 9th, at High Firs, Bursledon, Hants, the wife of A. V. Roe—a daughter.

AVIATION IN EGYPT IN 1915.

BY AN OBSERVER IN THE FRENCH SEAPLANE SQUADRON, PORT SAID.

In these days of cross-Atlantic flights and 160 m.p.h. machines it is very interesting to look back at our machines and equipment in the pre-historic days of 1915.

I have taken an interest in aviation since the early efforts of H. Farman and the Wright brothers; but, being in the East at the outbreak of war, I enlisted, and was not able to join the R.F.C. until January, 1915. At that time I was serving with an Indian regiment on the Suez Canal, and managed to get transferred as an observer to the only squadron then in Egypt, afterwards No. 30.

This squadron consisted of the machines which were to have joined the nucleus of the Indian C.F.S. at, I think, Sitapur, and was composed of 70 h.p. Renault Longhorns and Shorthorns, 80 h.p. Gnôme H. Farmans, and one B.E.2a, which was the pride of the squadron. This B.E. was no joke to fly in the bumpy Egyptian air, as being a warping wing machine, knuckledusters were imperative to prevent the stick from cutting one's hands to ribbons against the longerons.

I only remained a short time with No. 30, and was then lent to a French seaplane squadron, based at Port Said, which was short of observers.

JOY SOMEWHAT DASHED.

I went down to Port Said full of joy, but when I heard that most of the work done by these machines—80 h.p. Gnôme Nieuport monoplane seaplanes—was 30-40 miles inland, my joy was somewhat dashed.

I shall always have the very greatest admiration for those French pilots and mechanics on account of the really wonderful work that they got out of their machines.

In 1915 these machines were identical with those designed, I believe, in 1912, being the ordinary Nieuport monoplanes less the wheels, and with the addition of outer struts to the undercarriage. They could, however, be quickly transformed into land machines, by the removal of the floats and these extra struts, and by fitting the leaf spring and wheels through a socket provided in the central skid.

The system of control was unusual, as the stick controlled the elevator and rudder, and the wings were warped by an upward and downward motion of what is usually the rudder-bar. I understand that this system was altered to the more usual one in the machines supplied to the R.N.A.S. and used at Calshot.

A revolution counter and altimeter were the only instruments fitted.

OF UNUSUAL DESIGN.

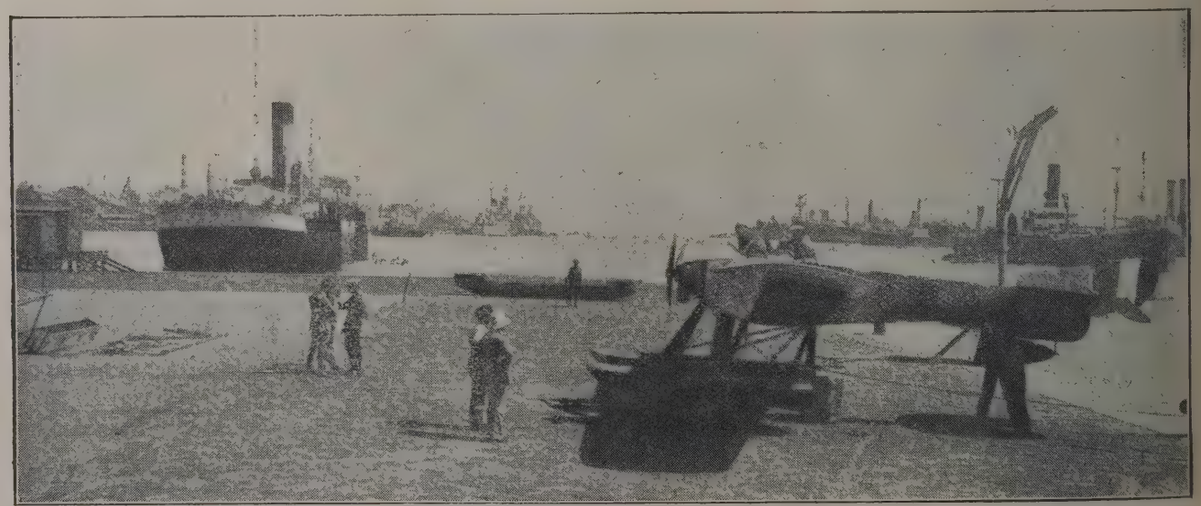
The floats themselves were of unusual design, having a stepped keel, and a metal plane on each side of the nose to prevent the float from "ducking." They were not provided with bulkheads, but were canvas-covered, and filled with inflated pigs' bladders. In the case of a crashed float, which occasionally occurred, the whole sea for hundreds of yards around was covered with these bladders, which emitted a most offensive odour.

Most of our work was done along the coasts of Palestine, Syria, and Asia Minor, which was out of the reach of the R.F.C., and for that purpose two seaplane-carriers were attached to the base, each capable of carrying two seaplanes under canvas awnings on the after well-deck.

These ships had each two English officers and Greek crews, and in them we went to sea, armed with two Lewis or Colt machine-guns on the bridge, and flying the blue ensign.

In the early part of 1915 submarine warfare had not yet begun seriously, in the Eastern Levant anyhow, and so we often lay with all lights showing two or three miles from the enemy coast waiting for favourable weather.

A PANIC AMONG THE CREW.



In March, 1915, during the first bombardment of Smyrna, one of these seaplane-carriers—the "Aenne Rickmers"—was torpedoed by a Turkish destroyer while at anchor under a flag of truce, but we never managed to discover whether the destroyer really meant to hit us, or whether it was a bad shot for H.M.S. "Euryalus," which was lying near by. This took place at 2 a.m., and a panic immediately took place amongst the Greek crew. The captain and chief engineer were English, whilst the other officers and crew were Greek, but we luckily also had a steamboat's crew of naval ratings, and a detachment of Royal Marines as a guard. The Greeks deserted, and took all the boats, and the Marines turned out just too late to stop them; but as they went over the side, one of the Marines gave a Greek sailor a nice jab in the pit of the stomach with his bayonet, to discover that in his haste in turning out, he had, unfortunately, forgotten to remove the scabbard. The only Greek who did not desert was the second engineer, who was on watch at the time, and who was locked, howling and shrieking, in the engine-room, by the chief engineer, and ordered to keep the pumps going.

CONSIDERED HIMSELF A HERO.

Luckily for us the bulkheads held, and although we had a hole 26 ft. by 16 ft. in the starboard side near the bow, the ship did not sink, and, on the next day, this gentleman had quite recovered from his fright, and looked on himself as a hero, so much so that a month or two later, when the Greek crew were paid off, and replaced by Navy men, he asked for a testimonial to show that he had bravely stuck to his ship when all the others had deserted.

The "Aenne Rickmers," or H.M.S. "Anne," as she was afterwards christened, belonged before the war to the "Rickmers" line, and in the wardroom hung a large photograph of Fraulein Rickmers, after whom the ship had been named. Every officer who served in the ship wrote his name on this photograph, and it was proposed to send this to the lady at the end of the war; but whether this has been carried out, or whether it has been "pinched" by some souvenir-hunter, I do not know, as the "Anne" is no longer a seaplane-carrier.

The machines had by no means a good performance even in those days. Speed about 52 m.p.h. at sea level, with a ceiling of about 5,000 ft., and the climb to 1,000 metres (about

The Seaplane Station at Port Said in 1915.

3,300 ft.), with three hours' fuel, pilot, observer, a rifle, and forty rounds of ammunition, and one 10 kg. bomb, or a camera, took 30-35 minutes.

We were not allowed to fly inland under 1,000 metres, and so our radius of action was a good deal handicapped by this slow climb.

Primitive Bomb-Dropping.

We did a little bombing, but not very much, as we could only carry one 10 kg. bomb, and in that case could not carry a camera as well.

The bomb-dropping apparatus was very primitive indeed.

In the first place, as the observer was placed in front of the pilot, a tube had to be arranged through the floor of the observer's cockpit to carry the bomb clear of the undercarriage and floats.

The bomb itself—a 20-lb. H.E. shell, with a tinplate fin attached—was carried strapped to the top of the port wing.

The bomb-sight was a prehistoric edition of the equal distance sight, and consisted of a piece of three-ply wood attached to the starboard side of the machine, into which three nails had been driven in the form of a triangle. A sand-glass was used in conjunction with the sight, in place of the reversible watch at present used.

Before starting off on a bombing stunt the observer was supplied with the sand-glass, on which the height in metres was marked on the stem—the striker of the bomb—a piece of string—and a knife.

Before dropping, the bomb had to be prepared—quite a long and complicated business. First of all, the bomb had to be unstrapped from the wing, and placed on the observer's knees. A cork was then drawn from the nose, and the striker screwed in in its place. One end of the string was then attached to a ring at the tail of the bomb, and the other end to a cross-strut in the fuselage. One had then to remove the safety-pin from the striker and manœuvre the bomb into the bomb-tube, a dangerous proceeding, as the bomb with the striker in it was almost the same width as the fuselage.

A Nieuport Sea-Monoplane (80 h.p. Clerget Engine).

O.Ks. not Common.

Presuming that all this has been safely accomplished, and that we are now approaching our target, we stand up, and, holding the sand-glass in one hand, and the knife in the other, we take our sights. The sand-glass is started when the top and forward pins come in line with the target, and is reversed when the top and rear pins are in line with it. We can now leave our sight, and trusting to our pilot to keep on the line, which, incidentally, he cannot see from his seat at this point, we note our height on the altimeter. When the sand has risen to the correct height in the stem of the sand-glass we cut the string, and the bomb falls. O.Ks. by this method are not very common!

In the early part of 1915 we were not equipped with wireless apparatus, and so for co-operation with artillery the squadron was provided with an infernal type of firework, called a "smoke-bomb." These were issued in four forms—"Trainit," which made a long trail of smoke, and three other kinds forming one, two, and three balls of smoke respectively. All these four types were bottle-shaped, fitted with a ring at the top, and in order to ignite them, this ring, and about a yard of string attached to it, had to be pulled slowly out. The time between the beginning of the pull and the burst being only four seconds, one had to be pretty quick getting them down the bomb-tube.

The S.S. "Aenne Rickmers" (later H.M.S. "Anne") after her encounter with a Torpedo.

Later on in the year the squadron received several sets of W/T apparatus, but the earlier forms were dangerous, and on account of an open spark had a nasty habit of igniting any petrol vapour about the machine.

FIRED ONCE AND BACKFIRED TWICE.

When at sea, after the machine had been hoisted out of the ship, itself a slow and difficult job with the rough winches, booms and tackle used for cargo-shifting, began the business of getting the engine started. The starting-handle was carried in the observer's cockpit, which, being very small, made it very difficult for anybody larger than a small boy to swing it from anywhere inside the machine. One usually wound violently for about five minutes, at the end of which the engine would fire once, backfire twice, and catch fire, which meant hurling oneself out of the machine on to the undercarriage, and plugging the air intake pipe with the nearest thing at hand, usually one's own flying cap.

Having at last got the engine started, we commenced a game of ping-pong with the ocean, and on each bump the observer's head came in contact with the forward part of the cabane. An 80 h.p. machine has not much power with which to get "unstuck," and so, if there were no waves, we sometimes got off, but usually did not, and if there were any waves, we certainly never did, but buzzed about like a million infuriated bees, covered in spray

Not a few forced landings were made on the desert in enemy country, and in no case did the crew get off unscathed in the crash. In December, 1915, a machine returning from a reconnaissance of Beer Sheba, had its petrol-pipe severed by a bullet, and a landing had to be made on the desert near Gaza. Unfortunately, there happened to be some Bedouins near by, and the observer, Lieut. H. M. C. Ledger, I.A.R.O., met his death trying to keep these Bedouins off with his rifle, while his pilot set light to the machine. Lieut. Ledger was awarded a posthumous Légion d'Honneur for his act.

AN UNPLEASANT FLIGHT.

One of the first jobs given to the squadron after its arrival in Egypt was a reconnaissance of Maan, a station on the Hedjaz railway, some 40 miles from the Gulf of Akaba. This flight meant crossing a range of mountains some 6,000 ft. high behind Akaba, which was more than the ceiling of the machines with full load. Several attempts to find a pass were made, but after butting into the various valleys, and finding no way over, the flight had to be abandoned. On one attempt a forced landing was made some 8-10 miles up the Wadi Akaba, and the pilot and observer walked back to the shore through Turks with dogs, and were picked up by a boat from the ship.

Only one of the machines that landed in enemy territory was rebuilt by the Turks, as far as we know.

The Bedouins cut the first two that landed to pieces with their swords, as they had never seen an aeroplane before, and believed them to be alive. However, the Turks did rebuild one of them, and it crashed on its first flight, and both pilot and passenger were killed. This rather amused us when we heard of it, as the machine was one of a batch which had been built for the Turkish Navy, but had not been delivered on account of the war.

At the base at Port Said were two very ancient three-seaters with 100 h.p. 14-cylinder Gnômes, one of which dated back to a Paris Show some time before the Flood, and on these machines the observers obtained permission to learn to fly. Unfortunately, this permission was withdrawn a little later, as one of the observers, who had been strictly told not to try to take off, but to learn to taxi, managed to get his machine off tail to wind, stalled, and crashed her to splinters, fortunately, without more than a ducking to himself.

On being rescued by a boat, and brought back to the hangars, he left a note to the C.O., who was not there at the time, explaining that he had, unfortunately, broken a float. The C.O., on receipt of this, was heard to remark that he was glad that both floats had not been smashed, as, in that case, he might not even have got the engine back!

During the Naval attack on the Dardanelles two of the machines were attached to Commander Samson's squadron at Tenedos, but being so far from the base, and there being very few spare parts, and practically no facilities for engine overhaul, they soon became very soggy. The floats and extra struts were then removed, and they were used for some time as land machines.

Towards the end of 1915 a welcome addition to the squadron came in the form of some new machines with 100 h.p. Clerget engines. The 100 h.p. Clerget being practically the same as the present 130 h.p. motor, the performance of these machines was a good deal better than that of the old 80 h.p. machines, but the comfort from the observer's point of view was completely spoiled by the fact that his seat was placed sideways, and he faced the port side of the machine—not a very comfortable position in a machine with a gliding angle comparable with that of a brick, and it also meant a standing position to get any view at all.

The politeness of the Frenchman is proverbial, but, on one occasion, when a machine side-slipped and crashed into Port Said harbour in trying to avoid a ship in the fairway, the English observer was not to be outdone, and it was quite five minutes before it could be decided as to which was to be rescued first by the boat that dashed up to the scene of the accident.

On looking back one regrets the old 'buses and the fun that we used to get out of them; but when one remembers the frequent occasions on which the engine tried to cut out 20 or 30 miles inland, I think that we should have preferred the modern machine and engine, if we had had our choice.

AN AERODROME FOR SALE.

The Bembridge Seaplane Station, Isle of Wight, with a frontage on the Solent, and the Redcar Aerodrome, which has an area of about 120 acres, are to be sold by the Disposal Board of the Ministry of Munitions, to whom inquiries should be addressed at Charing Cross Buildings, London, W.C.2.

IS IT THE TRUTH?

A writer in "Truth" says:—

"The up-to-date 'Baby' Handley Page aeroplane, which flew to India to lend a hand in the Afghan war, was wrecked at Risalpur by one of the storms which prevail on the Indian frontier during the summer months. I am told that on arrival at Risalpur the machine was picketed out in the open with its wings extended, whereas it ought to have been picketed between two sheds with its wings folded. As it was, when the storm burst, for want of protection the machine was blown over like a piece of paper and become a complete wreck. What were those in authority doing to allow a valuable machine to be destroyed when a little trouble would have given it adequate protection?

"From other sources of information I gather that since the termination of the war there has been a want of supervising activity at R.A.F. headquarters at Simla, members of the Air Staff being chiefly occupied in organising a polo club. Polo is a good thing in its way, but work comes before play, and, judging from letters which reach me, the Air Staff at Simla do not realise this as completely as they should do. Among other things, I am informed that the G.O.C. pays flying visits to the squadrons in different areas, but never stays long enough for the purpose of effective inspection and for hearing complaints. The latter duty is one of the most important of a general's functions, and if they would bear this in mind my correspondence would be greatly reduced."

AN INTERESTING PUBLICATION.

Mr. G. Holt Thomas, one of the great pioneers of British Aviation, who established the first express air service between London and Paris a month ago, has been asked many times to produce a book on the subject. The result is the forthcoming issue, by Messrs. Hodder and Stoughton, of "Aerial Transport," by Mr. Holt Thomas, with an introduction written by Lord Northcliffe.

"What I desire particularly," says Mr. Holt Thomas, in describing his aim in this book, "is not to appear a fanatic. I have studied flying for thirteen years. Long before the war I urged the development of aircraft as weapons; and I can say without boasting that, when war came, my predictions were more than fulfilled. To-day I am just as keen an advocate of the aeroplane in commerce, and just as certain—even, in fact, more so—that my contentions are right. But I am quite as aware of the limitations of a commercial aircraft as I am of its powers. What I seek, in this book, is to show the actual place of the aeroplane in our general scheme of transport; the precise work it can do usefully, with its speed of 100 miles an hour, and the sort of thing it would be foolish to ask it to do. Specially, too, I emphasise the point, which is fundamental, that the aeroplane does not compete with existing forms of transport. It does something they cannot do; it supplements, not supplants, them."

A feature of Mr. Holt Thomas's book will be nearly a hundred full-page reproductions of specially selected photographs, each illustrating some phase of aerial transport.

BOOKS REVIEWED.

AERONAUTICS MADE EASY.

We were needing a pendant to "The Aeroplane Speaks," something that would explain in detail *how* an aeroplane flies, the *why* of it having been covered by Captain Barber's well-known volume. And "Aeronautics Made Easy," by Captain W G. Aston (a one-time colleague of Mr. C. G. Grey's on the "Aero") (Iliffe and Sons, Ltd.; 4s. 6d. net), is the very thing that was wanted—a book of exceeding amplitude, considering its handy size—thorough in its treatment, and with it all readable and clear.

The author has attained a happy mean between the ineffable boredom of the primer method of inculcating aeronautics on the one hand, and over-complexity on the other. He presupposes in his reader a considerable interest in and a slight knowledge of mechanics, a smattering of physics, and no more mathematical knowledge than is required to count one's change correctly after two shots. In short, a public-school educational equipment!

If the clear, easy exposition did not attract the casual buyer, he would certainly be wooed by the alluring little illustrations with which the book is dotted. These cannot fail to make all plain to the veriest of muffs. There is no more of science to be encountered within its covers than may be discovered in the average fifth-form physics class, yet the reasonably careful reader cannot fail to glean from it a really useful working knowledge of the application in practice of the knowledge of theoreticians. Accessible as a popular newspaper in its form (though written in infinitely better English), it imparts its information with an artful insidiousness. It might have been called "Aviation Without Tears."

Beginning *piano*, the writer works up from the motion of bodies in the air to a pellucidly clear exposition of the streamline form, with notes on power and resistance. For a while he discourses on planes moving in fluids, discants on the parallelogram of forces, lift and drag, the centre of pressure, and before you know where you are you are studying wing sections with an intelligence gratifying to yourself.

His examples are very pat, and the point of view often refreshingly original. As an instance of this let me quote a paragraph which exemplifies both qualities:—

"It is almost obvious that if a plane section be set at a small angle of incidence at which the normally continuous flow is present, and if this angle is gradually increased, there will come a point at which continuous flow ceases, and discontinuous flow sets in. This, in practice, is found to be so, but careful investigations have shown that a rather strange state of affairs occurs. Let us suppose, for the sake of argument, that at an angle of incidence of 20 degrees the flow over a certain plane section 'goes all to pieces,' but that at 15 degrees it is quite continuous, provided that this angle has been attained very gradually by slowly increasing the setting of the plane from a very small angle at the start.

"One would be inclined to conclude from this that the flow at a 15-degree angle would always be continuous, but such is not the case; for if, say, the plane be suddenly turned from 5 degrees to 15 degrees, it will at the latter angle be found to be suffering from discontinuous flow (and this may occur at 12 degrees or earlier, according to the type of section employed).

"In short, by careful coaxing the air can be made to take a course that it would refuse if such were demanded of it with more abruptness. The plane has, as it were, to be courteous to the air with which it comes in contact, and provided it ingratiates itself sufficiently can take considerable liberties with what is otherwise a very uncompromising medium.

"An experiment which is often performed in physics lecture theatres consists in cooling a test-tube full of water below freezing point by the simple expedient of keeping it perfectly still and undisturbed whilst in the freezing mixture. In this way the water can be kept in a liquid state although its temperature is much below 32 degrees. The moment, however, a single particle of ice is dropped into the water it instantly solidifies into a congealed mass, as though it had simply been waiting for something to set it off."

To tear matter from its text is always to do violence to a writer, but I think that the above constitutes a better testimony to the special attributes of this book than I could convey by description or analysis. The shape and loading of planes and subsidiary surfaces, the position and functions of elevator, rudder, and ailerons, and such matters as directional stability, are given appropriate place. The chapter on the airscrew is brief, but quite sufficiently informative for the type of reader for whom the book is intended. Even a lethargic layman, I think, would not have time to get bored with any of these succinct little expositions.

Following a chapter on the general arrangement of forces, the author treats in detail of the construction and control of the accepted types of planes, and nowhere are his excellent illustrations more commendable than in this particular section. They could give the Rag-Books of the amiable Mister Dean points for clearness. In treating of stability the writer is on slippery ground, but he escorts his reader patiently and slowly, setting his metaphorical steps on one solid boulder of fact after another. Occasionally he has recourse to easily comprehended tables.

The chapter on aero-engines is perhaps a little scant; I should have liked to have seen Captain Aston's felicitous methods of elucidation applied at greater length herein.

Towards his conclusion he deals with aeronautical manœuvres and "stunts," passing on to a *resumé* covering atmospheric density, wing resistance, body resistance, density of air at different levels, and its effects upon engine efficiency and carburation; variable airscrew pitch, and high altitude work.

A few notes on models are inserted, the author has evidently given some consideration to this subject in his time, and he also touches on varying types of seaplanes and the flying boat.

There is a useful glossary, and a practicable index; and alike for its clarity, its concision, and its adequacy, the book is what we should have expected from the writer—the best in its field. —K. H. B.

"V.Cs. OF THE AIR."

If you happen to win the V.C. with your two feet planted firmly on the ground, the worst that can happen to you is that you may be haled on to a platform in front of an assortment of huzzaing locals. The mayor of those parts, complete with chain of office as fitted, will emit a few rasping platitudes in your direction, and the M.P. for the district, with an expression of unnatural benevolence upon his face, will invest you with a life ticket of admission to the local picture palace, with a can of Keating's thoughtfully included.

If, on the other hand, you happen to be one of our "intrepid, etc.," a worse thing may befall you. You may find yourself perpetuated past all undoing in some such horrific publication as "V.Cs. of the Air," by Lt. Gilbert Barnett (Messrs. E. J. Burrow and Co., Ltd., 5s.). And if the deed for which you were awarded that little bit of bronze is portrayed by Mister Dudley Tennant in one of his unique paintings, you will assuredly never live it down.

The textual matter is bald, soldierly, and sufficient; but the illustrations are decidedly *impasto* in treatment, the colour in the originals evidently having been thumped on in generous gobs. As reproduced, all atmosphere is lacking, and the amazing tattered aeroplanes depicted are one and all "as idle as a painted ship upon a painted ocean."

Those aeroplanes compel my admiration. So torn are they that they resemble fourpenny umbrellas at a railway lost property auction sale, and yet they serenely defy the elements and hover blandly, like so many helicopters. In some cases there is that about them which suggests that they were fabricated by the gentlemen who were responsible for those charming Noah's arks which delighted our childhood. Their ruggedness, and a certain *je-ne-sais-quoi* about their under-carriages, heightens this impression.

As for the Zeppelins, you expect to see them footed by a highly ornate inscription to the effect that this is entirely the artist's own work, done with common chalk, and his only means of subsistence. You fumble for a penny as you look at them. The one which Warneford is destroying approximates most closely to the 1908 type. The publisher has not erred in describing these as "Dudley Tennant's wonderful drawings!"

The descriptions of the epic scraps depicted are studded here and there with such expressions as "death grapple in the heavens," "murk of the battlefield," "hungry tongues of flame," "ghastly chariot of fire," etc., etc., and, moreover, the writer will persist in describing fighting pilots as "airmen," a term which necessarily implies an enlisted man, and not an officer, from which it follows that nearly all his subjects are incorrectly described.

Have I said enough? I think so.—REX. H. BRITTAIN.

SCRAPS FROM LIFE.

None knows my weaknesses better than my bookseller. "I've got something here that, I think, will please you, sir," said he, and led me to two plump tomes of Molière, sumptuously bound in red morocco, tooled as to the edges, opening and closing perfectly; also a tiny set of six Oliver Wendell Holmes (charming, gentle pedant), less than ten shillings the lot. The man who would not have delved in his pocket for them would have been less than human.

And my new acquisitions have provided me with a comment which is wondrously apposite to a queer little volume, "Scraps from Life," by Charles Menten, R.A.F. (McAra and Whiteman, Ltd.; price—I know not what). This is what the Poet at the Breakfast Table says:—

"Oh, little man, that has published a little book full of little poems or other sputtering tokens of an uneasy condition, how I love you for . . . the one phosphorescent particle in your unilluminated intelligence! But if you don't leave your spun-sugar

confectionery business once in a while, and come out among lusty men—the bristly, pachydermatous fellows, . . . the out-of-door men that fight for the great prizes of life—you will come to think that the spun-sugar business is the chief end of man, and begin to feel and look as if you believed yourself as much above common people as that personage of whom Tourgueneff says that 'he had the air of his own statue erected by national subscription.'"

This book consists of jejune essays and trite maxims, quaint introspections, and such absurd little cynicisms as this:—

"No man's life is wholly devoid of good; except in the eyes of his wife." That is cheap and silly, and I expect Mr. Menten knows it.

The book really is nothing more than a semi-articulate expression of the keen emotions that come to one-and-twenty on the threshold of things, before we "see life steadily, and see it whole." It is boy's work, having the awful seriousness of youth, its defects are calculated to surprise the most case-hardened reviewer; but if it betrays young follies, to be sloughed off later—there is also to be detected running through it a thread of something fine—a kind of clamant idealism. The writer is discovering the world, the old truths of Socrates and Epictetus are fire-new to him, and as such he shows them proudly to us, expressed in smoking-room phrasing.

There was no need to write:

"A true friend is one who should know all about you, but who loves you in spite of this."

It is an eternal verity, and therefore a platitude. Has not Mr. Menten read "The Thousandth Man," that he must give us this Claudius Clear version? And he must not tell fibs: "in life . . . false feelings and hypocrisy are the ruling factors." And Mr. Menten is by profession, I believe, an "observer"! Moreover, such phrases as "What is Superstition? Surely it is a survival of the olden days," would indicate that this author would be better employed in reading books than writing them. Throughout the little volume he is asking, "Why, why?" Let him be still, and life will teach him. There is nothing new in his growing pains, that he should describe them, they are common to all of us. Let him read nothing but the best stuff, shun all writing, and take plenteous exercise.

The morbidly introspective farrago he has produced is but the product of a painful phase of his development. He is struggling to find his soul. May the best of luck attend him.—R. H. B.

THE KINGDOM OF THE AIR.

[By EDGAR C. MIDDLETON. (Simpkin, Marshall, Hamilton, Kent and Co., Ltd. Price 6s.)]

One has in the past read many books dealing with aviation and aircraft, and one has been struck by the similarity between them all. Here and there one book, such as "Contact's" "Airmen's Outings," or "Spin's" "Short Flights," or McCudden's great autobiography, has undoubtedly achieved a real success. But, speaking broadly, the majority of them have been, to say the least of it, unnecessary.

When once a thing has been said moderately well, and explained moderately clearly, what need to say or explain it badly all over again?

One still awaits the Kipling of aeronautical literature. What a relief it would be to read a well-informed, well-written story which concerns itself with aviation. For when one wants such an article one naturally turns to the aeronautical Press, or to the few—and remarkably few— reliable standard works, knowing that such matter published in book form is utterly unreliable and generally unreadable.

Enclosed in a pretty slip-cover designed by Mr. Dudley Tennant, one has Mr. Edgar Middleton's latest attempt. The introduction is a poem written by the Lord Montagu of Beaulieu in the dark ages of aviation, and it is far too good for the rest of the book. The book itself contains 252 pages, and some illustrations. Its one great advantage is that the type is large and therefore quickly read.

Mr. Middleton begins by telling one that as the sailor is a different being from other men, the "Airman" must needs be also. One was quite aware that this was the case, as the war and R.A.F. have proved, but one must congratulate the Royal Navy on producing quite a different specimen of mankind from that produced by the R.A.F. The Navy is civilised, at any rate.

One of his obiter dicta is: "The flying man, even at this early stage of his career, has learnt the golden muteness that the R.A.F. already has borrowed from the 'Silent Service' (p. 24). Would that Mr. Middleton had learned as much during his brief Service career.

On page 39 occurs the following: "But still these 'feather-brained' young men persisted. Numbered amongst that splendid band were such names as Cody, Sykes, Hawker, Maitland, Roils, Henderson, and Hamel." Mr. Cody was fifty years of age and Major Sykes was over thirty, General Henderson was somewhere about fifty—but let that pass.

As to matters of fact, without referring back to the communiqués of the period one cannot be certain, naturally, but one was under the impression that on Dec. 25th, 1914, "Engadine" was accompanied to the neighbourhood of Cuxhaven by two other seaplane-carriers, and one certainly recollects the fact that the escort included other ships beside "Arethusa." Mr. Middleton would lead one to think differently.

Surely, in the light of recent events, Chapter 12 is in rather bad taste, consisting, as it does, of the story of Lieut. E. C. Chamberlain, U.S., M.C., and a portion of his report.

There is nothing more to write concerning this book, except that, throughout, it is written in the best journalese.—S. F. B.

FOR W.R.A.Fs.

HANDBOOK FOR THE WOMEN'S ROYAL AIR FORCE. (Gale and Polden, Ltd. Price 2s. 6d.)

This book, which has recently been published, is printed on very good thick paper. There are 152 pages, 12 chapters, and an index. The book follows the good old conventional rules for handbooks, beginning with a chapter dealing with the formation and organisation of the R.A.F. and ending with a glossary of technical terms.

Doubtless W.R.A.Fs. will find it very useful, particularly the chapters on discipline and official correspondence.

One is perfectly certain that all domestically inclined W.R.A.Fs. will be glad of the recipes contained in chapter 9; but one quite fails to see the reason for the songs contained in chapter 11.—S.F.B.

"AIRCRAFT IDENTIFICATION."

Mr. R. Borlase Matthews has produced a very useful little book called "The Aircraft Identification Book," which is published by Crosby, Lockwood and Son, at the price of 3s. 6d. There was a time when anybody with any experience of aeroplanes could tell at a glance the make of an aeroplane in the air even at a distance of some miles, but in these days aeroplanes of different makes so closely resemble one another that only the very experienced eye can identify the particular make.

Mr. Matthews has, therefore, produced this book so that even the fairly experienced person can have in handy pocket form a reference book which will help him to identify the various makes almost at a glance. Something like 200 aeroplanes are shown, each in three-line drawings, one giving the machine in side view, one dead-on, and one showing the tail in plan view, these being the particular views from which one is best able to identify any specific machine. Alongside each machine is a brief paragraph pointing out the noticeable points in the outline of the machine.

Some of these notes might have been a shade more explicit, but, on the whole, the work is very well done.

Possibly the reader might have been saved some confusion, or, at any rate, unnecessary effort of memorising, if certain utterly obsolete machines, such as the Russian "Sikorski," the original "Wright," and a few others had been omitted.

The only section of the book which appears to be really defective is that dealing with flying-boats, of which only two examples are shown, though there are many other types in use.

A useful idea is the leaving of a space at the end of each section for notes by the owner of the book so that he can bring the pages up-to-date as new types develop.

The book can be obtained, post free, 3s. 9d., from The Aeroplane and General Publishing Co., Ltd., 61, Carey Street, W.C.2

CLASS NAMES FOR MACHINES.

The following letter has been received:—

Sir,—In a recent number of your paper a letter from "Penguin" appeared, asking if a simple scheme could be formulated for the nomenclature of present-day aircraft, which will allow for future types.

In the "Aircraft Identification Book," by R. Borlase Matthews and C. T. Clarkson (Crosby Lockwood and Son), the Brussels Decimal Classification has been developed and extended by the first author and myself to the classification of aircraft, for the future as well as for the present. This classification, which is an analytical one, is numerical and therefore international. It expresses in numbers in the shortest manner possible the most complete analytical description.

Thus P.21.034.53 indicates a biplane, with single airscrew, tractor type, having a single pair of struts on each side of the fuselage; the planes with forward stagger set with a dihedral angle, and the engine of the vertical type.

As it is a decimal classification, it automatically sorts out and collects together aircraft with the same features, and is in consequence invaluable to the orderly arrangement of bibliographical information.

If it is desired that names instead of figures should be used, it is a simple matter to translate the figures into words by means of the figure alphabet, universally known to all students of memory training, and its use for this purpose is fully explained in the little book referred to.

It is highly desirable that this classification should be adopted, as it is part of the great Brussels International Decimal Classification of all human knowledge, used at the Institut de Bibliographie, the Bureau Bibliographique of Paris, the Concilium Bibliographicum of Zurich, and many other institutions. It can be applied with great simplicity, in an analytical manner, to the classification of anything, and gives to that thing a rigid and definite position in the number complex representing the whole of human knowledge.—ALAN POLLARD, Captain, R.A.F.

EXTRACTS FROM "THE LONDON GAZETTE."

GREAT BRITAIN.

NAVAL.

ADMIRALTY, Sept. 4th.

Payr. Lt. to be Payr. Lt.-Comdr. :—C. R. F. Noyes, D.S.O., May 25th, 1917.

ADMIRALTY, Sept. 17th.

The following decoration has been conferred by the King of the Belgians for distinguished service rendered during the war :—

ORDER OF LEOPOLD.—CHEVALIER.

Maj (temp. Brig.-Gen.) E. L. Gerrard, R.M. (late Sqdn Commdr., R.N.A.S.).

The King has given unrestricted permission to the officer concerned to wear the decoration in question.

MILITARY.

WAR OFFICE, September 15th.

REGULAR FORCES.—ESTABLISHMENTS.—R.F.C.—Mil. Wing.—Adjt.—Lt. H. Tillev (Durh. L.I.), and to be temp. Capt. (without pay or allowances of that rank) whilst so empld., and to be secd., Jan. 17th, 1918.

WAR OFFICE, Sept. 16th.

REGULAR FORCES.—INFANTRY—SERVICE BATTS.—YORKS AND LANCS R.—Temp. Lt. C. H. Scadden resigns his commission on appointment to R.A.F., Nov. 15th, 1918.

MEMORANDUM.—Sec. Lt. J. D. Payne, M.C., Gen List (attd. R.A.F.), retires, receiving a gratuity, Sept. 17th.

OVERSEAS FORCES.—CANADA.—NOVA SCOTIA R.—Temp. Lt.-Col. G. C. St. P. de Dombasle, O.B.E., relinquishes his commn. on the O.M.F. of C. on appointment to a commission in the R.A.F., Aug. 31st.

QUEBEC R.—The following officer retires in the British Isles :—Temp. Lt. H. H. Heal ceases to be secd. for duty with the R.A.F., Sept. 1st.

EASTERN ONTARIO R.—Temp. Lt. A. C. Lobley relinquishes his commission in the O.M.F of C. on appointment to a commission in the R.A.F., Aug. 1st.

1ST CENTRAL ONTARIO R.—Temp. Lt.-Col. R. Leckie, D.S.O., D.S.C., D.F.C., relinquishes his commission in O.M.F. of C. on appointment to a commission in R.A.F., Aug. 31st.

SASKATCHEWAN R.—Temp. Lt. W. L. Rutledge, A.F.C., M.M., relinquishes his commission in O.M.F. of C. on appointment to a commission in R.A.F., Aug. 15th

BRITISH COLUMBIA R.—Temp. Capt. D. R. MacLaren, D.S.O., M.C., D.F.C., relinquishes his commission and acting rank of Maj. in O.M.F. of C. on appointment to a commission in R.A.F., Aug. 31st

AIR FORCE.

AIR MINISTRY, Sept. 16th.

R.A.F.—The following officers have been granted short-service commns. in the ranks stated, with effect from September 16th. They will retain their seniority in the substantive rank last held by them prior to the grant of the short-service commn :—

Sqdn. Ldrs.—J. S. T. Bradley, O.B.E. (S.O.); H. E. J. Hewitt (Ad.).

Flt. Lts.—C. W. Bailey (A. and S.); L. P. F. Bawn (T.); A. M. Blake, A.F.C. (A.); L. O. Brown, D.S.C., A.F.C. (A. and S.); J. M. Burke (T.); D. K. Cameron (T.); B. R. Catchpole, M.C., D.F.C. (A.); H. L. Crichton, M.B.E. (S.O.); F. R. P. Dexter (Ad.); W. M. Fry, M.C. (A.); H. H James (A.); C. W. McCann (T.); P. H. Mackworth, D.F.C. (A. and S.); D. O. Mulholland, A.F.C. (A.); G. C. Rhodes (T.); P. D. Robertson (T.); W. G. Stephenson-Peach (T.); G. Stevens, O.B.E. (T.); C. A. Taylor (A.); B. C. Tooke (S.); C. J Truran, A.F.C. (A.); S. R. Watkins, A.F.C. (A.); D. W. Wilson (S.O.); P. Worthington, M.C. (T.); T. K. Young (T.).

Flying Offrs.—C. D. Adams (A.), J. M. Adams (Ad.), H. C. Atkin (T.), H. Auliff (Ad.), V. G. Austen (A.), H. B. S. Ballantyne (Ad.), J. F. T. Barrett (A.), H. F. V. Battle (A.), L. N. J. Bennett-Baggs (A.), W. Best (T.), A. T. Cooper (S.O.), E. D. H. Davies (S.), P. H. Davy (A.), D. W. Dean (S.O.), T. H. Evans (S.O.), A. L. Fiddament (A.), W. C. Green, M.C. (T.), J. D. Hewett (A.), R. V. J. S. Hogan (S.O.), A. Holmes (S.O.), W. E. Lunnon (A.), C. H. Masters (S.O.), J. V. Medcalf (A.), W. D. Miller (S.O.), F. J. Moule (A.), H. W. Prockter (T.), C. Rapley, M.S.M. (T.), D. B. Robertson (A.), W. A. Rochelle (A.), L. T. Sanderson, D.S.M. (S.O.), P. L. Sant (A.), J. T. Vernon (S.O.), W. W Whitehead (T.), R. F. Wilson (T.), W. K. Yarnold (T.), R. W. G. West (A.).

Observer Offrs.—R. B. Gordon, D.F.C., R. B. Hunter.

It is intended that officers employed as Stores Officers or on "Q" duties shall belong to the new Stores Branch when formed. Officers appearing in this "Gazette" who are at present so employed will be transferred to this Branch on its formation, and will accept these short-service commissions on that condition. They will then come onto the rates of pay of that Branch, but will meantime be permitted to draw the higher rates laid down in the new scheme for officers on the General List. Any officer posted to the Stores Branch on its formation will then have the option of declining his short-service commission.

ROYAL AIR FORCE.—PERMANENT COMMISSIONS.—The notification appearing in the "London Gazette," Aug. 1st, appointing the following officers to permanent commissions is cancelled :—Lt.-Col. R. A. Bradley (A.), C.M.G., Maj. F. B. Binney (A.), Maj A. Cleghorn (T.), Maj. E. J. Roberts (A.), Capt. L. I. Barker (A.), Capt. T. G. Bowler (Ad.), Capt. C. H. Dixon (A.) (D.F.C.), Capt. G. Donald (D.F.C.) (A. and S.), Capt. J. R. Howett (A.), Capt. H. L. H. Owen (A.) (A.F.C.), Capt. G. W. Robarts (A.) (M.C.), Lt. C. R. Robins (A.) (M.C.) (D.F.C.), Lt. F. N. S. Creek (O.) (M.C.), Lt. W. H. Date (S.O.), Lt. H. G. W. Debenham (A.), Lt. F. H. Eberli (A.), Lt. C. F. Falkenberg (A.) (D.F.C.), Lt. W. W. Glenn (Ad.) (M.C.), Lt. C. Harrison (A.) (deceased), Lt. S. Jones (A.) (D.F.C.), Lt. C. S. T. Lavers (A.) (D.F.C.), Lt. D. F. Lawson (A.), Lt. H. B. Maund (A.), Lt. P. N. Melitus (O.), Lt. F. G. Prince (A.) (deceased), Lt. C. F. Smith (A.), Lt. R. H. Somerset (A.), Lt. C. A. Spence (A.), Lt. A. G. Stradling (S.O.), Lt. E. B. Wilson (A.), Lt. D. Wood (A.).

The notification in "Gazette," Aug. 5th, concerning Capt. H. W. G. Jones is cancelled. The notification in "Gazette," Aug. 1st, is to stand.

The surname of Capt. R. T. Nevill (T.) is as now described, and not Neville as in "Gazette," Aug. 1st.

The surname of Lt. D. N. Thomson (M.C.) (S.O.) is as now described, and not Thompson as in "Gazette," Aug. 1st.

The following temp. appts. are made at the Air Ministry :—Director of Operations and Intelligence.—Air-Commodore J. M. Steel, C.M.G., C.B.E., Sept. 8th, vice Air Commodore R. M. Groves, C.B., D.S.O., A.F.C.

Transferred to the unempld. list:—Sec. Lt. I. T. Atwood, Sec. Lt. R. E. Brown, Sec. Lt. O. H. Clearwater, Sec. Lt. A. B. Cleveland, Sec. Lt. F. V. Collins, Sec. Lt. J. C. Dandurand, Sec. Lt. J. P. Davey, Sec. Lt. C. E. Delaney, Sec. Lt. A. J. Doiron, Sec. Lt. L. Driscoll, Sec. Lt. J. S. Finch, Sec. Lt. H. G. Hanneman, Sec. Lt. D. D. How, Sec. Lt. H. B. Hunter, Sec. Lt. A. G. McLerie, Sec. Lt. C. A. Pieper, Feb. 1st; Lt. J. J. Ambler, Lt. E. G. C. Quilter, Feb. 14th; Lt. A. H. P. Pehrson, March 9th; Lt. (Hon. Capt.) A. J. Lazarus-Barlow, March 14th; Lt. W. J. Garrity, March 15th; Capt. O. Hughes, March 25th; Lt. G. H. Olney, April 1st; Sec. Lt. F. P. Hodgson, April 11th; Lt. (actg. Capt.) A. Beck, D.F.C., April 19th, Lt. F. S. Smith, April 20th (substituted for the "Gazette" of July 11th, in which this officer was described as Sec. Lt. F. S. Smith); Sec. Lt. D. H. P. Johnson, April 22nd; Lt. W. C. O'Venden, April 23rd; Lt. J. T. G. Murison, April 26th; Sec. Lt. R. W. Hopper, May 10th; Lt. C. C. Paul, May 18th; Sec. Lt. S. G. Neal, May 23rd; Sec. Lt. T. Sydenham, June 3rd; Capt. W. B. Foster, June 10th; Sec. Lt. R. J. M. Jeffrey, June 13th; Lt. R. Fitton, M.C., July 24th (substituted for the notification in the "Gazette" of July 18th); Sec. Lt. J. Nicole, July 30th; Flying Officer R. Nisbet, Aug. 1st; Pilot Officer J. Murphy, Aug. 9th; Pilot Officer W. J. Large, Aug. 26th; Flight Lt. K. Ogden, Aug. 28th; Pilot Officer R. E. Norrish, Aug. 29th; Pilot Officer L. C. Atkins, Pilot Officer A. Champ, Pilot Officer J. W. Gardner, Flying Officer C. J. Kennedy, Sept. 1st; Flying Officer P. B. Clews, Sept. 6th; Flying Officer J. W. Jones, Pilot Officer W. C. Staunard, Sept. 7th; Pilot Officer N. V. Moreton, Pilot Officer J. S. Newman, Pilot Officer T. Rennie, Pilot Officer T. A. Thomas, Sept. 9th; Flying Officer O. W. Frayne, Pilot Officer J. C. Ivens, Pilot Officer L. G. Warren, Flying Officer F. C. B. Wedgwood, Sept. 10th; Flying Officer C. Hallawell, Sept. 11th; Flying Officer F. N. S. Creek, M.C., Sept. 12th; Sqdrn. Ldr. H. A. Petre, D.S.O., M.C., Sept. 15th, Pilot Officer H. Lovelady, Sept. 16th; Flying Officer G. V. Stewart, Sept. 18th.

The following relinquish their commns. on account of ill-health, and are permitted to retain their rank:—Capt. J. A. Hutchinson, May 20th (substituted for notifications in "Gazettes" of Jan. 24th and Aug. 8th); Sec. Lt. T. R. Adair (caused by wounds), July 10th; Sec. Lt. E. L. Goold, Sept. 5th.

Sec. Lt. J. A. Griffin relinquishes his commn., being physically unsuited for the duties of Pilot or Observer, Feb. 14th (substituted for notification in "Gazette" of Dec. 3rd, 1918).

Sec. Lt. O. F. G. Crosby is antedated in his appt. as Sec. Lt. (A.), May 10th, 1918.

The surname of Sec. Lt. A. E. Amey is as now described, and not "A. E. Amy," as stated in "Gazette" of Sept 3rd, 1918.

The notification in the "Gazette" of April 1st concerning Lt. B. N. Wills is cancelled.

The notification in the "Gazette" of April 4th concerning Lt. C. M. Shilcock is cancelled.

BURBERRY FLYING KIT

Designed by expert aviators and made in the Burberry material chosen by Sir John Alcock, D.S.C., for his flight across the Atlantic.

Lightweight, self-ventilating, and as flexible as an ordinary wool fabric, this material is as impenetrable as leather, and ensures comforting warmth at all altitudes.

Proofed by Burberry processes, it provides an effective safeguard against rain and all damp, without the aid of rubber, oiled-silk, or other air-tight agent.

Complete R.A.F. Kit in 2 to 4 Days, or Ready to Wear.

Illustrated Catalogue & Patterns Post Free.

Burberry Carapace Air-Suit

The Tielocken
Doubly covers every vulnerable part of the body, and is lined throughout with lightweight fleece. Fastens with a strap-and-buckle instead of buttons.

Burberry Carapace Air-Suit
The outrig worn by Sir John Alcock and Sir Whitten Brown on their Trans-atlantic flight
A thoroughly practical one-piece overall suit that protects the airman from head to heel.

Every Burberry Garment is labelled "Burberrys."

The notification in the "Gazette" of July 29th concerning Sec. Lt. J. P. Jones is cancelled.

ADMINISTRATIVE BRANCH.—Lt. E. L. Ridley to be Lt., from (A. and S.), Dec. 12th, 1918 (substituted for notification in "Gazette" of March 7th).

Sec. Lts. to be Lts.:—H. V. Hall, Aug. 27th, 1918 (substituted for notifications in "Gazettes" of March 7th and Aug. 15th); D. J. Fryer, March 13th; H. C. Bird, April 19th.

Sec. Lt. H. J. Payne to be actg. Lt. whilst empld. as Lt., from Nov. 23rd, 1918, to April 30th

Sec. Lt. H. J. Payne is graded for purposes of pay and allowances of Lt. whilst empld. as Lt., May 1st.

Transferred to unempld. list:—Lt. B. N. Wills, Jan. 17th; Lt. C. M. Shilcock, Feb. 27th; Sec. Lt. J. A. Tomson, March 7th; Lt. D. W. Orr, March 30th; Sec. Lt. C. H. S. Pain, May 3rd; Sec. Lt. W. Paterson, May 5th; Lt. J. M. Johnson, May 9th; Lt. C. I. Fletcher, July 8th; Lt. H. C. House, July 25th; Flt. Lt. M. Lewis, Aug. 14th; Pilot Officer S. McK. Pullen, Aug. 21st; Pilot Officer W. R. Taylor, Aug. 27th; Pilot Officer M. A. Jordan, Flying Officer C. T. H. Page, Aug. 29th; Pilot Officer E. H. Bacon, Sept. 1st; Pilot Officer B. Ninness, Sept. 6th; Pilot Officer C. Jackson, Pilot Officer R. H. Owen, Sept. 9th; Pilot Officer A. H. Bradley, Flying Officer F. A. Payne, Flying Officer W. R. Wood, Sept. 11th

Sec. Lt. G. R. Blake relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Aug. 14th.

TECHNICAL BRANCH.—Lt. A. C. Blackmore is graded for purposes of pay and allowances as Capt. whilst empld. as Capt., Grade (A.), from May 1st to July 2nd.

Lt. J. D. Robinson to be Lt., Grade (B.), from (A.), Nov. 21st, 1918.

Sec. Lts. to be Lts.:—(Hon. Lt.) J. E. Spickernell, April 2nd, 1918 (without pay and allowances of that rank prior to Sept. 14th, 1918); (Hon. Lt.) G. A. Tilly, April 2nd, 1918 ((without pay and allowances of that rank prior to Feb. 9th).

Sec. Lts. to be Lts., without pay and allowances of that rank:—F. Denham, March 13th; A. R. Conder, April 19th.

Lt. W. Barber (R.N.) relinquishes his commn. on ceasing to be empld., Aug. 21st.

Transferred to unempld list:—Lt. H. T. Thompson, April 11th; Sec. Lt. J. W. Smith, May 12th (substituted for notification in the "Gazette," July 18th); Lt. L. B. Jones, M.C., July 31st; Pilot Officer C. C. A. Poole, Aug. 2nd; Pilot Officer (Hon. Flying Officer) E. F. Boultbee, Aug. 23rd; Flying Officer J. R. Coulthard, Flt. Lt. R. Neilson, Aug. 30th; Pilot Officer G. Bowden, Flt. Lt. L. P. Hoult, Flt. Lt. E. Whitwell, Sept. 1st; Flying Officer C. H. Boyle, Flt. Lt. C. E. Shackle, Sept. 7th; Pilot Officer S. C. Addison, Pilot Officer W. E. Burden, Pilot Officer A. J. Gregson, Sept. 8th; Pilot Officer (Hon. Flying Officer) C. B. Harris, Flying Officer C. H. Higson, Pilot Officer R. Lyne, Pilot Officer W. M. Sercombe, Pilot Officer (Hon. Flying Officer) L. Stockton-Smith, Sept. 10th; Flt. Lt. D. Thomson, M.B.E., Sept. 12th

Lt. B. A. Hill relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Sept. 11th.

Sec. Lt. T. E. Lomas relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Sept. 8th.

The notification in the "Gazette" of July 22nd concerning Capt. F. Reynolds is cancelled.

MEDICAL BRANCH.—Wing. Comdr. (actg. Group Capt.) T. D. C. Barry is transferred to unempld. list, Aug. 31st.

The following temp. appts., "Women's Royal Air Force," are made at the Air Ministry:—To be Actg. Assist. Comdrs., 2nd Class:—Administrator P. E. Stapleton-Cotton, Administrator Mrs. W. M. Corbett (graded for pay as dep. asst. commandant), July 15th.

ADMINISTRATIVE BRANCH.—To be Actg. Administrators:—Dep. Administrators M. A. Mackay, July 1st; M. E. Clarke, July 13th; E. I. David, July 15th.

To be Actg. Dep. Administrators:—Asst. Administrators E. A. Rurbridge, May 6th; K. Hargreaves, June 15th; D. G. James, I. Huleatt (graded for pay as Asst. Administrator), July 1st; K. J. Wright, V. M. Orrock, July 6th; Mrs. M. M. Shields, July 10th; M. C. Whidborne, July 12th; N. Campbell, July 15th.

The date of relinquishment of appt. as Administrator of Mrs. N. C. Habrow (née Pasmore) is July 14th, and not as stated in "Gazette," July 22nd.

The following officer relinquishes her appt. on account of ill-health: Dep. Administrator Mrs. M. K. Unwin, July 25th.

The following officers relinquish their appts. at their own request:—Asst. Comdt., 2nd Class, Mrs. C. S. French, July 9th. Administrators.—R. V. Spinks, May 6th; Mrs. O. E. Tibbits (D.A.C.), July 18th; Mrs. K. Avison, July 22nd; O. Cayley, Aug. 1st; H. B. Womack, Aug. 5th. Dep. Administrators:—G. M. Ghubb, July 1st; G. Tighe, July 2nd; D. G. James, July 12th; Mrs. M. Savage, Aug. 13th; L. M. Mackay, Aug. 23rd; Mrs. F. F. Pelly, M. C. Ralston, Aug. 31st; M. Hallowell-Carew, Sept. 1st. Asst. Administrators.—B. W. Gilbert, June 10th; E. Watt, June 12th; Mrs. B. E. Thompson, June 27th; Mrs. K. A. D. Rolfe-Rogers, July 3rd; M. Wade, K. R. Bear, July 9th; M. L. Cumming, July 12th, M. C. Blackwell, July 16th; D. M. M. Allen, July 24th; M. C. Green, July 25th; M. Woodward, G. C. Gibson, July 26th; Mrs. P. M. C. Tyacke, July 30th; G. Green, Mrs. L. Swafield, July 31st; Mrs. M. Hessler, Aug. 1st; Mrs. J. I. Stubbs, Aug. 12th; E. E. Sharp, Aug. 16th; Mrs. M. B. Sersale, Aug. 19th; Mrs. I. M. Banks, Aug. 23rd; E. Middleton, Aug. 30th; Mrs. C. S. Swann, Sept. 1st.

The following officers relinquish their appts. on completion of service:—Asst. Comdts., 1st Class.—Mrs. W. M. Powell, Aug. 26th; E. M. Hamilton, Sept. 5th. Asst. Comdt., 2nd Class.—E. O'Sullivan, Aug. 26th. Administrators.—S. A. Grady, Aug. 11th; V. Thurstan (D.A.C.), Sept. 2nd. Dep. Administrator.—K. McDermott, June 30th. Asst. Administrators.—D. B. Gordon, Aug. 22nd; M. M. Hugh-Smith, Aug. 26th.

MEMORANDA.—90984 Cdt. H. T. Collins is granted an hon. commn. as Sec. Lt., April 2nd.

The following temp. Hon. Lts. relinquish their commns. on ceasing to be empld.:—T. Leopard, June 16th; H. S. Burdett, Sept. 16th.

Transferred to unempld. list:—Flying Officer R. H. H. Watson, from (S.O.), Aug. 1st; Pilot Officer S. G. Nash, Sept. 9th.

The notification in "Gazette," Sept. 5th, concerning Sec. Lt. T. A. Bayly is cancelled.

The notifications in "Gazette," Sept. 5th, concerning the following Pilot Officers are cancelled:—J. A. S. Cooke, J. M. Fraser, T. E. Fisher, E. Fortin, E. Hanley, T. S. Laird.

WAR OFFICE, September 20th.

REGULAR FORCES.—ESTABLISHMENTS.—R.F.C.—Mil. Wing.—The following appointment is made:—Equipment Officer, 3rd Class.—Temp. Sec. Lt. (on prob.) D. J. Fryer, Gen. List, and to be confirmed in his rank, Feb. 20th, 1918.

PERSONAL NOTICES.

NAVAL.

ENGAGEMENT.

SPARLING—THORN-DRURY.—An engagement is announced between Wing Cmdr. Evelyn Hayley Sparling, R.A.F. (Lt.-Cmdr., R.N.), younger son of William Sparling, of 10, Upper Maze Hill, St. Leonards, late Bogawantalawa, Ceylon, and Silvia Maud, only daughter of G. Thorn-Drury, K.C., of 42, Roland Gardens, S.W.7.

BIRTH.

NORTON.—On Sept. 9th, at Nocton Heath, Lincoln, the wife of Major E. W. Norton, D.S.C., R.A.F., of a daughter.

MILITARY.

DEATHS.

MOCATTA.—Captain Frederick E. Mocatta, A.M.I.C.E., B.Sc., R.A.F., died on Aug. 26th after an operation for septic meningitis. Born in 1890, he served with the Royal Artillery in the 29th Division in the Gallipoli Expedition and took part in the first landing on April 25th, 1915. After the evacuation he saw service in Egypt and France, whence he was invalided home. He was then seconded to the R.A.F. and did excellent work in the Aircraft Production Department at York House.

WALTHEW.—Sec. Lt. John Syers Walthew, R.F.C., the second son of Mr. and Mrs. Walthew, of Harpenden, who was previously reported missing on Sept. 19th, 1917, is now officially presumed to have been killed on that date.

ENGAGEMENT.

BEALE—BROCK.—The engagement is announced between Norman Sydney Beale, M.C., Légion d'Honneur, late Lt., East Surrey Reg. and R.A.F., eldest son of Mr. and Mrs. S. B. Beale, of Sutton House, Sutton, and Margaret Eleanor St. Hill (Nora), youngest daughter of Mr. and Mrs. Arthur Brock, of Haredon, North Cheam.

MARRIAGE.

HAMBLY—STRANGE.—On Sept. 3rd, at St. Matthew's Church, Ealing, Capt. Arthur Francis Hambly, late 2nd Essex and R.A.F., of Bodmin, Cornwall, was married to Vera Mary, eldest daughter of Mrs. John Strange, 5, Tring Avenue, Ealing, by the Rev. Sadler Phillips.

BIRTH.

RUSSELL.—On Sept. 19th, 1919, at 17, Park Lane, to the wife of Wing Commander R. E. M. Russell, C.B.E., D.S.O., R.A.F. (late Lt.-Col., R.E.)—a daughter.

AIR FORCE.

DEATH.

RUDGE.—Lieut. Arthur E. Rudge, 203rd Squadron, R.A.F., who was reported missing after an aerial combat on July 22nd, 1918, is now presumed to have been killed on that date. He was the younger son of J. E. and Julia Rudge, of Paris, and 9, Belsize Park, N.W., and was 19 years of age.

ENGAGEMENT.

FOSTER-STENNING.—The engagement is announced of Capt. William Barham Foster, late R.A.F., son of Mr. and Mrs. Frank Foster, of Buenos Aires, and Alice Margaret, daughter of the late Oswald Francis Stenning and Mrs. Stenning and granddaughter of Sir Alexander Stenning, of West Hoathly, Sussex.

MARRIAGE.

ALBROW—SMALL.—On Sept. 17th, at St. Columba's Church of Scotland, London, W., Lieut. Herbert Victor Albrow, R.A.F., eldest son of Mr. Albrow, Epsom, was married to Margaret Maxwell, younger daughter of the late Mr. John Small, of Wentworth, Jamaica, and Broughty Ferry, and sister of the late Lieut. John Small, B.W., M.A., LL.B., Advocate, Edinburgh, by the Rev. Archibald Fleming, D.D.

AIRCRAFT CONTRACTS.

It is stated that the committee of business men engaged in liquidating contracts for aircraft outstanding at the date of the armistice has cut liabilities of £150,000,000 in half and left the Ministry of Munitions with about 12,000 engines and 3,000 machines for disposal after the R.A.F. has provided for its own needs.

A WORKS CLOSING DOWN.

Owing to the Government cancelling orders for aeroplane construction, the works of the Cambrian Aircraft Constructors (Limited), Cardiff, employing 500 hands, are closing down next week. A proposal to utilise the works for making windows and doors for housing was not adopted.

SOUVENIRS

By "VESTERSYL."

"Is Snooks about?"

The Technical Serjeant-Major turned round smartly and faced the young Flight Lieutenant.

"He is in the repair shop, sir."

"Tell him I want him, please."

"Very good, sir," and the Technical Serjeant-Major, after looking very knowingly at the "prop" tip in the hand of the young officer, trotted off towards the repair shop.

Presently Snooks came out of the shop, approached the officer, and saluted.

"You sent for me, sir."

"Yes, Snooks, I want you to make me a brevet of this," and he proffered the propeller tip to the expert wood worker. "When can I have it?"

"To-morrow, sir," replied Snooks.

"To-morrow?" said the officer. "But I want it to-day. It is a souvenir."

"Very good, sir; you shall have it in two hours," and Snooks went away with a smile upon his face, produced in all probability by the thought of the half-crown tip he was sure to get.

Snooks no doubt was the "brevet" expert. Others in the same squadron, however, had their own specialities so far as the production of souvenirs was concerned. For instance, Snooks, although the "brevet" expert, could not hold the candle to Jones, who guaranteed to produce a perfect biscuit barrel from the "prop boss" of any propeller. And so the souvenir game went merrily on.

PETROL LIGHTERS.

There are very few persons in the Royal Air Force who have not made or procured, at some time or other, a souvenir of the great war. The writer, for instance, has in his possession a neat little petrol cigarette lighter made from the oil pressure regulating cap of a B.H.P. engine. This cap, in addition to an aluminium plug, surmounted by a fantastic copper stud, pronged to receive the steel wheel, makes a very nice little job. A certain amount of curiosity as to how I obtained the material may be aroused. To allay this, I may say that they were "scrap" and were given to me in a quite honest and legitimate manner. If you inquire of anyone who possesses a souvenir, you will be told the same tale.

Regarding the types of souvenirs I have seen, I can truly say that these are varied. As a matter of fact, "varied" is not the word to use; there are hardly two alike. I have seen souvenirs discarded merely because their owner has seen another "something like it."

Cigarette lighters I have seen have taken various shapes and sizes. Some are really works of art. Some are of aluminium, others of copper, a few of brass, and some a combination of the three materials. As a matter of fact, they are excellent articles, such as could have been made on a "night shift" where the craftsman has had quite an abundance of "his own time."

One of them in particular that I can remember is a massive article capable of holding quite half a pint of petrol. It is made of copper, topped with a brass fuse cap from a 3in. shell. Its owner is very proud of it, and he delights to place it on the table with the remark, "Help yourself to a light," when he has visitors for the proverbial hand at cards.

I once saw a unique souvenir made by someone in a certain squadron. It was a pair of connecting rods from a Gnôme engine, crossed, and surmounted by a piston. A small clock in the centre of the piston indicated the purpose for which the souvenir was made. The whole was mounted upon a mahogany board, and it made quite a good job.

It is true that the souvenir has something of the "death's head" look about it, and that it cost its owner 28s. to have it electro-plated. But what matters that so long as he can point with pride to it in years to come and say, "That is part of a Gnôme, you know—one of those engines we used in the Great War."

A PISTON AS A ROSE BOWL.

I was talking to my old friend "Mac" one day in the machine shop where he supervised the manufacture of certain component parts of aero-engines, when he was approached by a lady employee. She had a piston in her hand.

"Will you please have a hole drilled in the centre of this?" she inquired, indicating the crown of the piston. The job was accordingly done.

I had the pleasure of seeing this souvenir some little time afterwards. It was mounted upon an inlet valve stem, and with specially cut pieces of streamline, made, I must confess, an excellent rose bowl. It is a little bit weighty perhaps, but, then, one will not object to lifting a little extra weight when exhibiting a souvenir to a host of admiring, and a little bit jealous, friends in the year 1930.

Cylinder liners are, or were, a favourite souvenir among the workers of one firm which manufactured aeroplanes and aero engines. This was, no doubt, due to the fact that the firm referred to was prepared to sell scrap liners to employees for the small sum of one shilling each.

These liners, mounted upon a wooden base, made excellent flower-pot stands. In some cases they were enamelled and artistically painted. I had the pleasure of seeing a pair beautifully decorated with landscape oil paintings. The owner proudly points to them and refers to them as the liners of the engine that did a lot of bombing in the Great War.

I have heard it said that there are more copper rings fitted on the wrists of R.A.F. airmen and their sweethearts than were ever fitted in the engines. I do not believe this, although I do know that many of them do act as an adornment for the wrist. I have one in my possession. It was sent to me after being made from a scrap ring. They really look like gold, and, neatly engraved, are regarded as excellent souvenirs.

THE CONNECTING-ROD CLOCK.

An excellent souvenir is the connecting-rod clock. This takes the form of a connecting-rod with a round clock securely fitted in the large end. The end is hung upon the wall by placing the small end over a nail. Nicely electro-plated, this makes a neat job.

In an office the other day I came across a very interesting souvenir. This was nothing more or less than a gudgeon-pin bush taken from a captured German Mercédès engine. This bush is made of phosphor bronze, and has a number of ¼ in. holes drilled in it. The function of these holes, when fitted in the small end of the connecting-rod, is to allow a free passage for oil between the gudgeon pin and the small end of the connecting rod. As a souvenir, its function is a pen rack. Two aluminium knobs were turned and fitted in each end of the bush, these being mounted upon two brass pillars. It meets its requirements adequately, and, owing to its curious appearance, it seldom fails to give its owner an opportunity of explaining its origin to his visitors when he is asked, "What have you got there?"

One young woman I know was married in a dress made from some of the fabric with which the wings of aeroplanes are covered. She takes a great pride in this, and no doubt it will be placed in the proverbial "glass case" pending the arrival of the next generations, who, no doubt, will look upon grandma's dress as the finest of all souvenirs of the war.

The most interesting souvenir I have seen is in the house of a friend of mine at Leicester. This is nothing more or less than a complete Gnôme engine. It is suspended from the centre of the drawing-room ceiling by its shaft and a strong chain. The sparking plugs have been removed and electric light holders are fitted in the sparking-plug holes. With opalescent shades this engine not only forms one of the most remarkable souvenirs of the war, but it is extremely useful as an electrolier. Quite a contrast to my humble cigarette lighter, isn't it?

ON THE PROJECTED SEAPLANE RACE AND ITS PROMOTERS.

Undoubtedly the Committee of the Royal Aero Club has done well in promoting a seaplane race at the end of this month, by way of wiping out the disgrace of the Schneider Cup fiasco. It is earnestly to be hoped that the race will receive adequate support in the way of entries, and that it will not be killed by the Railway Strike.

The four British machines which were entered for the Schneider Cup are presumably available in any case, and it ought to be within the capabilities of the diplomatists of the Royal Aero Club to induce the French Aircraft Industry to enter a few machines. One fears that Italy is rather too far away to send machines to compete for so small a prize unless some special inducement is offered. And there does not seem to be any prospect of entries from other countries, seeing that Germany is still outside the International Convention.

It seems worth while to discuss one or two matters affecting this race, in the hopes that the points raised may cause the minds of the Committeemen of the Royal Aero Club to operate in a manner profitable to the Club and to the future of the Sport of Flying—which, rather than the Art of Hotel-Keeping, is the proper function of the Club.

The Question of Entries.

In the first place, so far as at present announced, the scheme of the race does not appear to offer any attractions to entrants other than the four Schneider Cup machines. The £100 trophy generously presented by Lieut.-Col. McClean is, it seems, to go to the winner along with the £500 prize. There are no second and third prizes, which would induce other owners of seaplanes to enter machines which are obviously too slow to win, but which would stand a sporting chance for a "place" if two or three of the Schneider machines failed to start or to finish.

There are in fact seaplanes in half-dozens if not in dozens round the coast which could be induced to enter for the race if there were a prospect of picking up some sort of prize and a certain amount of advertisement. The Avro people have several of their standard machines fitted with floats, which put up quite a good speed. The Supermarine Co. has the flying-boats with which its pilots have been taking up passengers at Bournemouth. The Eastbourne Aviation Co. has several Shorts and Avros which have also been used for passenger-carrying. The Fairey Aviation Co. has sundry experimental seaplanes, large and small, which would also be available. Probably Short Bros. have a few undelivered machines, originally built to Government order, which could be entered. And there would be no lack of pilots for such machines. Mr. Dick Fairey remarked a few days ago, "There is our machine ready to fly, and we'll race anybody for half-a-crown or a plated crumb-scoop!" That is the spirit of a good many more constructors and pilots.

The Committee's Last Chance.

To use an Americanism, it is up to the Committee of the Royal Aero Club to make as good a show as possible, not merely for the honour of British Sport, but for the Club's existence in the future, or, at any rate, for the continued existence of the present members of the Committee on the Committee.

Those who read the Civil Aerial Transport Notes last week (a section of this paper which one personally considers the most interesting of all) will have noticed the brilliant success of the Italian Seaplane Race round the Island of Sicily for a trophy presented by that great sportsman, the Cavaliere Florio. Twenty-seven starters and eighteen finishers in a race in which the winner's time was five hours and sixteen minutes is pretty good showing for a starving and bankrupt country, torn by internal dissention—as Italy is supposed to be.

If the Royal Aero Club of Great Britain cannot make as good a show as that, then it speaks badly for our position as the leading sporting nation in general, and for the ability of the Committee of the R.Ae.C. in particular. The Committee has this chance and this chance only of justifying its existence before the next Club election comes on in March or thereabouts.

A Painful Parable.

There seems to be, and there has seemed to be for many years, a tendency on the part of the Committee to regard itself as having been appointed by Providence rather than as having been elected by the Members. And as a corrective to that point of view perhaps a small true story which is also a parable may serve a useful purpose.

A certain Town Council in Ireland desired to instal itself in new and important Council Offices—which it could well afford, seeing that Ireland is now one of the richest countries in Europe, thanks to the war. Unfortunately, the particular block of buildings which the Council coveted for its new offices belonged to an old lady who was distinctly hostile to the Council, so that a kind of modern democratic Naboth's vineyard was created. As the result, the Council sought statutory powers to purchase and asked for a Local Government Board Inquiry to investigate and adjudicate on the case.

A particularly affable and ingenious official was sent down to look into the matter, and, by way of helping towards an amicable settlement, he called upon the owner of the buildings, accompanied by one of the notables of the town. The lady was not amenable to persuasion, and after refusing negotiation concluded by saying: "And the Good God will see that I'm not evicted from me property!" To which her fellow-townsman replied promptly: "Well then, now, Ma'am. I wouldn't trust in Him *too* much. Don't forget that He evicted the first two tenants that ever He had!"

One may believe in the Divine Right of Kings, but one has no belief in the Divine Right of Committees. *Vox Populi Vox Dei* is the most outrageous nonsense that was ever put on paper. *Vox populi vox stulti* would be much nearer the truth, for where an incompetent Committee or Parliament remains in power too long it is because it is re-elected by the voice of the fool. Nevertheless, on occasion the fool becomes wise, and unless the Committee of the Royal Aero Club justifies its existence now that it has the chance, it may well find itself evicted as effectually at the next election as were Adam and Eve. Therefore one counsels it to make the best of its opportunities during the next three weeks so that the Seaplane Race may be a success.

The Issue at Stake.

All this may seem much of a pother to raise over a mere £500 prize and a £100 pot, but the issue is far greater than this one race. The real issue is whether the Royal Aero Club and its Committee as at present constituted is fit to have any voice in the future of Flying not only in this country but in the rest of the World. The Schneider Cup fiasco would seem to prove conclusively that it is not. The coming race is its only chance of proving that it is.

The Committee will be well advised to call into its councils men of experience: men who have organised successful competitions in flying, yachting, motoring, and athletic events: men with practical (and recent) experience in flying high-speed aeroplanes and seaplanes: men with knowledge of practical aeroplane design: men with business knowledge. At present the main Committee of the Club, the Technical Committee and the Competitions Committee are far too academic, or include too many back numbers. There is no need to increase the size of these Committees, for "Too many cooks spoil the broth" is truer than "In a multitude of councillors there is wisdom." It will suffice if the knowledgable people are asked to call on the Committee and to state their views—as a favour to the Club. The Committees themselves should be benches of judges, not debating societies.

Such men as one has suggested are readily available, and one knows some who are very willing to help. One writes without any personal interest, for one has no experience of the subjects mentioned, and, anyhow, one's position as editor of this paper debars one from taking part in the work of Committees, for it is necessary as an editor to be impartial and to view all matters from the outside. But there are many men available who have vastly greater knowledge than any members of any of the Club's Committees.

Unwarranted Criticism.

It has been suggested by mere members of the Royal Aero Club that the Committee has no right to spend £500 of the Club's money—besides the expenses of running the race—in an attempt to cover up its own mistakes, and that if the Committee wants to put itself right in the eyes of the world it should do so out of its own pocket.

With this view one disagrees most cordially. The acts of the Committee are the acts of the Club, for the Committee was elected by the Club. If the Committee makes an ass of itself, the Club has also made an ass of itself by electing the Committee. If the Committee—as is alleged—takes but little interest in and pays little attention to the opinions of the members of the Club, that is because the members of the Club pay so little attention to the opinions and views of the people whom they elect to the Committee.

Therefore one is all in favour of the Committee's spending as much as it likes of the Club's money in the effort not merely to rehabilitate itself in the eyes of the members, but in the still greater effort to rehabilitate the Club in the eyes of the World in general and the sporting community in particular.

A Bigger Proposition.

Personally one is of the opinion that the Committee has not gone far enough. Besides the £500 prize and the McClean Cup for the fastest time, one would like to see another £200 or so put up for second and third fastest time.

Still better one would like to see a further £500 put up (in prizes of £250, £150, and £100) for the first three machines home in a Sealed Handicap Race to be run concurrently with the speed race, as has been done so successfully for several years in the Aerial Derby. This would ensure a decent entry, and we should then be certain of having something of a success to put up against the brilliant showing of poor little Italy.

Objections and Answers.

It may be objected that the Club's Committee (Sporting or Technical) does not feel competent to tackle the task of working out the handicaps. If it does not, there are others who can do the job, for there has never been any trouble over the handicapping in the Aerial Derby. And, if the principle, which was so successful in motor-racing at Brooklands, of disqualifying competitors who exceeded their "declared speed" by too great a percentage were adopted, there would be no fear of run-away wins, for competitors would be more likely to over-state than under-state their speeds.

It may also be objected that it is too late in the year for such an undertaking as a big race of this sort. The answer is, firstly, that if the Club does not do something big it can make up its mind to take a back seat as a sporting body in future; and, secondly, that if due attention is paid to meteorological warnings, it is just as possible to find three fine hours at the end of October as it is to find them in the middle of the Summer. The Schneider Cup race was ruined by a perfect Summer day, which produced a perfect sea-fog. Late October may produce a clear day with a big wind which will test the value of seaplanes even in Southampton Water.

Further it may be objected that there is no time in which to organise such a race. That depends entirely on whether the Committee of the Club is willing to work for its future existence or whether it insists on holding amiable debates over a tea-pot.

There is nothing whatever about the scheme which is not perfectly workable if the Committee is willing to work. But if the Committee of the Royal Aero Club chooses to ally itself in principle and practice with the wood-workers, coal-getters, iron-founders, and railway-transporters of this country, who neither work, get, found, nor transport, then there is nothing more to be said on the subject.—C. G. G.

Those who, owing to the Railway Strike, fail to obtain THE AEROPLANE from newsagents can have the missing numbers sent to them by post for sixpence—post free—from the Publishers:—The Aeroplane and General Publishing Co., Ltd., 61, Carey Street, W.C.2.

THE STRIKE AND THE OPPORTUNITY OF AVIATION.

It would appear that the old proverb to the effect that "It is an ill wind which blows nobody any good," is justifying itself to-day as well as ever. The railway strike which is causing everybody so much inconvenience is undoubtedly affording the finest possible opportunity to those concerned with and for Civil Aviation. The records of flying during the past three or four days, as recorded in their proper place in the Civil Aerial Transport Notes, are naturally incomplete, because reports from the Provincial centres have not yet been received, and even those from the London aerodromes are far from complete, owing to the pressure of work on the organisers of Civil Aerial Transport ventures. It is, however, recorded that quite a number of people have chartered special aeroplanes to carry them on urgent business, and, undoubtedly, if more aeroplanes had been available, more of these special journeys would have been made. Also, if the organisation of Civil Aviation ventures had been more fully developed, prices would have been lower, and, probably, still more people would have travelled by air.

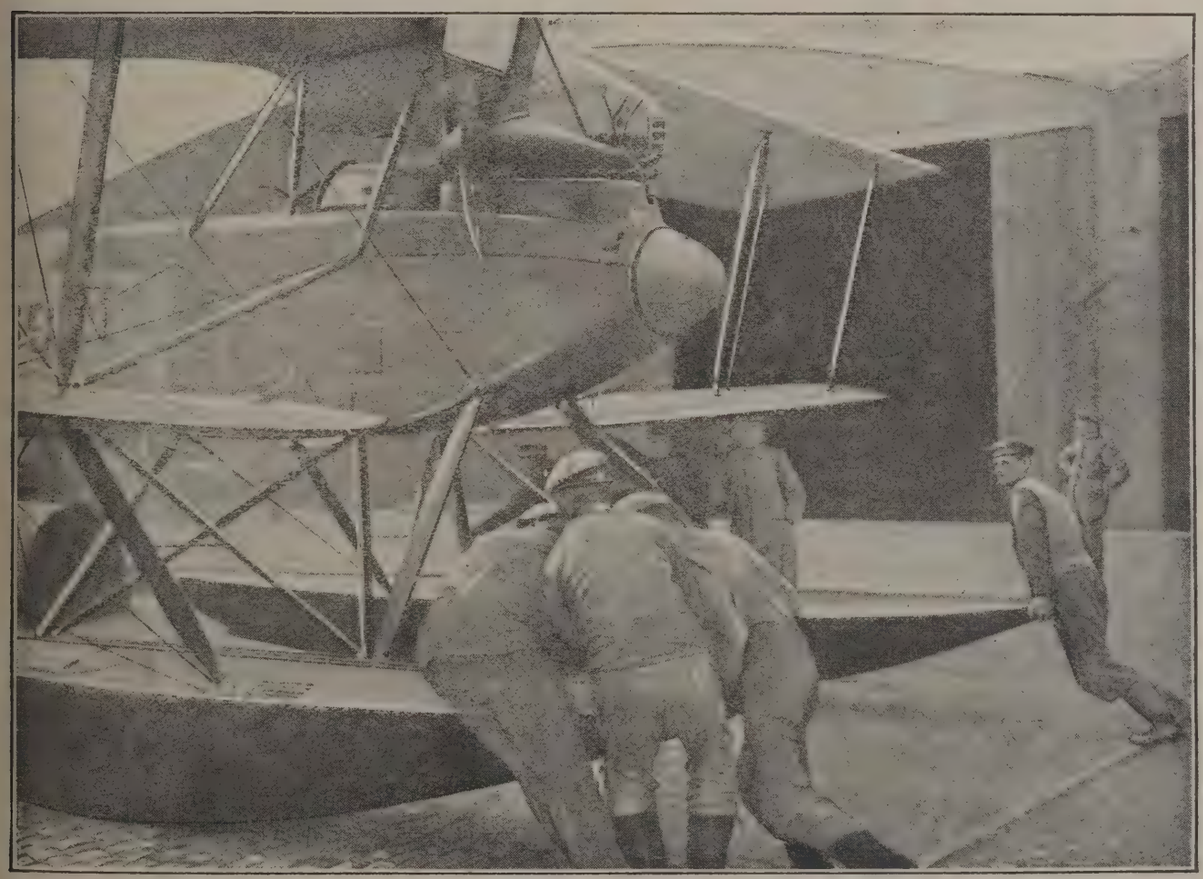
Even as it is, enough has been done to show that it is worth while to do still more, but this moderate success of the various air lines as passenger-carriers is as nothing to one really great triumph which has been scored by Civil Aviation over officialdom. For the first time His Majesty's Post Office has permitted aeroplanes to carry His Majesty's mails.

An Official Dictum.

It will be remembered that not many months ago, Mr. Illingworth, the Postmaster-General, treated a proposal to carry mails by aeroplane with scorn, alleging, apparently without any particular proof, that an aerial mail service was only about 60 per cent. efficient. Probably, Mr. Illingworth was basing his figures on the very primitive attempts made by the R.A.F. to run a mail service between London and Cologne not very long after the Armistice.

Everything was against the success of such a service. The best mechanics in the R.A.F. were being rapidly demobilised, the whole thing was run in the slipshod manner which unfortunately came to be associated with the R.A.F. before the process of demobilisation began to weed out the worst of the personnel, as well as some of the best, and the weather at that particular period was such as to make the worst of a bad job.

A Transatlantic Success.



If Mr. Illingworth had taken the trouble to study the figures of the American mail services he would probably have held very different views. The first American experiment between New York and Washington was run with machines of a kind which even in America were called "elementary training machines," a type which, in fact, had been turned down in this country a year or two before as unsuitable for any kind of use. Yet, in spite of this, the percentage of successes was so good as to encourage the U.S. Post Office to extend the service.

After the Armistice quite reasonably effective aeroplanes were put into use, machines of a type which might possibly have been fit to use on active service. With these machines the percentage of efficiency became enormously high, so that when a few weeks ago the U.S. Postal Department published their figures for the first year of working, the efficiency was shown to be something over 95 per cent., and it was stated officially that the aeroplane service actually saved the nation 170,000 dollars (roughly, £34,000), as against the sum which would have been paid to the railways for carrying the same amount of mail matter.

Conditions of Competition.

This point is particularly worth noticing, because in America the aeroplane services between Washington, New York, Chicago, and Cleveland were competing with highly efficient railways running such crack trains as the "Empire State Express" and the "20th Century, Limited," and were not—as would be the case in England—competing with railways debilitated by Government control and manned by a personnel seething with discontent. Moreover, in America, the aeroplanes were competing with a straight-away railway run, whereas in this country the proposed mail services were to the Continent and to Ireland, so that the aeroplanes would have had the additional advantage of competing against slow steamboats and the delays of transhipment at each end of the sea journey.

If such successes could be achieved in America, how much more possible would it have been to achieve success in the mail services proposed in this country? Still, no amount of argument or proof is ever enough to move a British Govern-

Testing the Engine of a Seaplane at a German Station.

ment Department. Something in the nature of a social upheaval or a surgical operation is necessary to compel progress.

The Uses of Pressure.

The necessary pressure has now been applied, and Mr. Illingworth—doubtless very much against his will—has been compelled to commit his precious mails to the despised aeroplane. It is only to be hoped that those responsible for the aeroplane mail service will make it a success, and that fortune will favour them with fine weather for the duration of the strike. Naturally, for one's own personal convenience, one would like to see the strike over at once, but from the point of view of the future of civil aviation it might be a good thing if the strike lasted for a few weeks, and at the moment of writing it appears quite probable that it will do so.

The railwaymen seem very determined to see the thing through, and those to whom one has spoken seem to feel that they have a very real grievance. Naturally the daily Press does not give the men's point of view. As one has remarked on several occasions, the daily Press of this country is either directly under the thumb of the Government or is under the thumb of somebody who does not want to fall out with the Government. Consequently practically every daily paper in existence reflects the Government point of view.

The Alleged Grievance.

The real trouble with the railwaymen appears to be very simply and plainly that they do not trust the word of the Government. Nobody can particularly blame them for that attitude because practically everybody has at one time or another had cause to complain that the Government has not kept its word on some subject or another with which he or she is immediately concerned. The men say that the Government made certain definite promises that the whole matter of the pay of the different grades should be fixed by mutual agreement before the end of the year. On that understanding they returned to work after the last railway strike.

The men say that since they returned to work on that occasion the Government has done nothing, and that if they go on working the Government will go on doing nothing. Therefore, they allege that their only hope of getting a definite decision before the end of the year, when the war bonuses are removed, is to strike now. On the face of it this appears a reasonable argument, and if the men are wrong the Government ought to take proper steps to inform the men individually just where they are wrong and just what the Government has done in order to settle matters before the end of the year.

One cannot recall having seen anything in the Press since the last railway strike to indicate that the Government has done anything to settle matters, and presumably the average railwayman is in the same position as one is oneself. Therefore it appears that the Government is somewhat to blame for not keeping the men informed about the possibly excellent work which it has done in the direction of settling affairs by amicable arrangement.

Mr. J. H. Thomas, the great leader of the railwaymen, gave to the Press the other day a list of some of the anomalies which existed. He pointed out, for example, that a railway-shunter—a job which is one of the most dangerous in all our industries—gets 60s. a week, whereas a colliery-shunter working alongside him gets 70s. to 75s. a week. Also he pointed out that a railway guard, after years of service, gets 60s. a week, whereas a 'bus conductor after six months' work gets 73s. When one compares the responsibility of a railway-guard and the honesty of character necessary to handle the goods entrusted to his care, one begins to see that there are certain grievances which obviously must be redressed if the railwaymen are to give good and honest service. The fact that those anomalies have not been redressed ten months after the Armistice is certainly not to the credit of the Government.

When it comes to a plain statement of the facts on one side or the other we have the word of one Welshman, Mr. Lloyd George, against the word of another Welshman, Mr. J. H. Thomas, and one sees no reason to believe or disbelieve one any more than the other.

At any rate there is the strike and there are the aeroplanes. The various Civil Aerial Transport firms seem to be making the best of their opportunities, and whatever may be the result of the strike it is to be hoped that the work done by the aeroplanes in carrying mails, and those passengers whose business has made it worth their while to pay the high price at present necessary for aerial transport, will establish firmly in the minds of the business community and of Government Departments that the aeroplane is a vehicle which is worth using in ordinary times, and is not merely one upon which they may be compelled to rely in times of stress.—C. G. G.

AN R.A.F. MYSTERY.

There seems to be room in the Royal Air Force at the moment for a Sherlock Holmes of the very first class, and if any officer or man feels inclined to play the part of a private detective in his spare time one can suggest a line of search which is likely to keep him busy and amused at any rate during the period of a temporary commission.

It will be remembered that some time ago there appeared in this paper and others a short paragraph respecting the loss of early Squadron Record Books of the Royal Flying Corps. These books contained all the records of flying and other work done by the four aeroplane squadrons and one airship squadron of the Royal Flying Corps which existed before the outbreak of war, and naturally they are of immense historical value, as they date from the formation of the Royal Flying Corps in April, 1912, and contain all records up to the outbreak of war.

These Record Books disappeared in a most mysterious manner not very long ago, and anybody who can find any trace of them will be conferring a benefit not only on the Royal Air Force, but on aviation in general, for they are urgently needed by those who are at present engaged in writing the Official Air History of the War.

The story of the disappearance of these records is distinctly quaint. On the declaration of war orders were sent to the four officers commanding the four aeroplane squadrons then in being to forward all their records to R.F.C. Headquarters at South Farnborough. A Board of Inquiry which was held recently has obtained positive proof that these orders were faithfully fulfilled. The records were dispatched packed in wooden cases—generally Renault or Gnôme engine boxes—from No. 2 Squadron at Montrose and from Nos. 3 and 4 Squadrons at Netheravon. No. 5 Squadron was at Farnborough and the records had only to be sent to the Headquarters Office from the Squadron Office.

Naturally in the process of building up the R.F.C. a number of different officers were in command at H.Q., Farnborough, and nobody had any particular time to pay attention to the Squadron Records. These appear to have been housed in various places, owing to their original dumping-ground being needed for other purposes, but it is fairly well proved that they all existed at Farnborough so long as Farnborough remained H.Q., R.F.C.

Then when the Royal Air Force was formed and the great depot at Blandford came into being, the cases were sent off from Farnborough for the new Record Office. From that day to this no definite trace of them has been discovered, and there is no reliable evidence to show what became of them, except that a few isolated pages—evidently torn out of the Record Books—have come into the hands of the Historical Branch, R.A.F., which is engaged in writing the aforesaid official air history.

Everything points to these odd pages having come out of the books which were in the missing cases. It is quite possible that the cases may have been opened by some person or other who, not realising that the bundles of old books inside were of real historical value, merely threw them out onto the scrap heap. In that case possibly some of the men of the R.A.F. may have picked up odd volumes of the records and have kept them as souvenirs, not realising their value for historical purposes. Equally possibly the people who opened the cases may have thought that these early records of the R.F.C. would be interesting souvenirs of the Great War, but may not have appreciated their still greater value to the Officer in Charge of Records.

If any reader of this paper, whether officer or airman, can throw any light on the disappearance of these records he will be doing a service to everybody concerned with aviation if he will pass on any information which he may have on the subject to the Officer in Charge, Historical Branch, R.A.F., 2, Cavendish Square, W.1; and naturally, if anybody happens to have any of the books in his possession, he equally will be doing a service if he will send them along forthwith to the aforesaid officer.—C. G. G.

AN AIRCRAFT BED.

The promoters of the exhibition of models and pictures of aircraft which was opened at the Princes Galleries, Piccadilly, on Sept. 15th, hope that it will be the means of providing 10,000 shillings, clear of all expenses, to provide an airship bed at St. Dunstan's. The sum represents the total number of in-patients and out-patients treated at Lady Sybil Grant's Hospital at Roehampton during the war. It is hoped that all interested will send to their late Hospital Commandant something to be sold at the gift stall in the exhibition, or 1s. direct to Lady Sybil Grant, Primrose House, Roehampton, London, S.W.15.

CIVIL FLYING

WITH

THE SOPWITH "DOVE" 2-SEATER SPORTING MODEL.

COMFORT AND ECONOMY

The Sopwith "DOVE" is a sporting and utility aeroplane, based, in point of design and general arrangement, upon the famous Sopwith "PUP."

With its fast climb, high-speed, quick manœuvrability and wide-speed range it is an ideal safety-first pleasure aircraft.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

A Professor of Aeronautics.

It is announced that Mr. Bennet Melville Jones, of Emmanuel College, Cambridge, has been elected to the "Francis Mond" Professorship of Aeronautical Engineering in Cambridge University.

It may be remembered that prior to 1913 Mr. Melville Jones was a member of the staff of the National Physical Laboratory engaged upon Aeronautical Research work, and that in that year he joined the staff of Sir W. G. Armstrong, Whitworth and Co. in connection with their Airship Department.

In September, 1914, Mr. Jones joined the Royal Aircraft Factory, remaining there till 1916, when he was transferred to Orfordness Armament Experimental Station, with the rank of Captain, R.F.C.

He later became Assistant Controller of Experiment and Research, with the rank of Lieut.-Colonel, R.A.F., having, in the meantime, served as a pilot with No. 48 Squadron in France.

The Case of Miss Douglas-Pennant.

Messrs. Simmons and Simmons, on behalf of Mr. W. C. Bersey, have lodged certain statements with regard to the case of Miss Douglas-Pennant before the House of Lords Committee in readiness for the hearing on Oct. 14th. Mr. Patrick Hastings, K.C., and Mr. Thomas Carthew have been retained on behalf of Mr. Bersey.

An American Competition.

The Aero Club of America has decided to offer prizes totalling one million dollars for an aerial race round the world.

Competitors will be permitted to use as many machines as they like in the race, and may use airships for all or any part of the course. In addition, they will be allowed to use any other means of transport for making connections between aircraft to the extent of 10 per cent. of the total distance to be covered. Alternative routes will be given to competitors for crossing the Atlantic and Pacific.

A special commission has been appointed to arrange the route and appoint referees in every country through which the competitors will pass. This commission will start during October.

The same scheme was mooted before the war, and this new edition is just as likely to be a success—or otherwise.

Another £10,000 Prize.

In order to commemorate the visit of the Prince of Wales to the capital of British Columbia and to encourage in Canada the development of aeronautics, Mr. Norman Yarrow, of Victoria, the head of Yarrows, Ltd., has offered a prize of £10,000 for the first non-stop flight across the Pacific Ocean from Vancouver Island to Japan.

The flight is to be made by a lighter-than-air machine which must be manufactured in Canada.

The airship is to be navigated and manned by Canadians. The flight must be a non-stop one and must be performed before December 31st, 1921.

Aeroplanes in the Antarctic.

Mr. John L. Cope, the leader and organiser of the British Imperial Antarctic Expedition, states that preparations are well advanced for the projected flight to the South Pole. He says that the death of Brig.-Gen. Lee had been a terrible blow. He had signed on with the expedition as chief of the aeronautical staff and would have piloted the aeroplane to the South Pole. Negotiations are now in progress with a famous aviator to take the place of General Lee.

Mr. Cope states that he is not merely going to fly to the Pole, but he intends to use the aeroplane throughout the six or seven years that the expedition will be on the ice. The Antarctic has never been charted properly, largely owing to the fact that many parts were quite inaccessible on foot.

It is his intention to chart the whole Antarctic from the air. He is glad to see that his old leader, Commander Shackleton, had expressed his views upon the prospects, and that he is in agreement with him regarding the practical use of the aeroplane. Of course, the machine itself would have to be of a very special type. In the first place, it would have to carry a very heavy load, four men and provisions for at least one month.

On the journey to the Pole they will have to cross a range of mountains which rises to 10,000 ft. Instead of wheels on the undercarriage there will be skids so that they can land on or rise from snow and ice

Amongst the personnel of the expedition is Mr. Ernest Joyce, who accompanied the first Scott expedition to the South Pole, and was a member of both Shackleton expeditions. Mr. Joyce is now on his way to England from Sydney, and he has agreed to serve as second in command to Mr. Cope.

An Airship Enterprise.

According to reports in the daily Press, Vickers, Ltd., have decided to complete the R.80.

It may be remembered that this rigid airship was designed by Vickers, Ltd., for the Admiralty, under the limitations imposed by the fact that the new airship shed at Walney Island had to be abandoned owing to the shortage of steel.

The ship was therefore limited in overall dimensions by the capacity of their existing sheds, and thus R.80—although of later design—is consequently smaller than the R.33 and R.34 class.

Every effort has been made to overcome the handicap of size by careful design, and R.80 is expected to show a very great advance in the ratio of structure weight to total weight over all previous designs.

It is not clear from present information whether the completion of R.80 is to be carried out by Vickers as a private undertaking or whether the Air Ministry has been persuaded to assist in the process. It is in any case fairly certain that the impulse did not originate in the Air Ministry, and Vickers, Ltd., are to be congratulated on their enterprise.

Beware!

The following advertisement recently appeared in the daily Press :—

PILOT WANTED for passenger flying; CAPITAL REQUIRED not less than £1,000; wage £5 p.w. and 3½ per cent. commission; should earn £8 to £10 p.w. Confidential.

Officers are warned to avoid investing their gratuities in concerns in which their salaries are liable to be paid from that same gratuity. One has no knowledge of the advertiser quoted, and the scheme may be unimpeachable, but the advertisement is of a type which has been used many times by flat-catchers.

Detectives in Aeroplanes.

According to the "Observer," the peaceful island of Capri, the delightful resort dear to so many English people, has had a little sensation all to itself. Apparently the Ministry of the Interior, from which depend the police, has not disdained to interest itself in the doings of the Siren Isle. As a result of some information, it instructed the Naples police to make inquiries about the existence of a gaming-house on Capri, where some of the visitors were in the habit of passing their evenings.

A Neapolitan detective, disguised as a tourist, crossed over to the island and began to make discreet inquiries in the public resorts, and in that world of free camaraderie which the morning bathing beach at Capri presents. He was not long in tracing the whereabouts of the gaming-house. But, fearing to alarm his prey by ordering a posse of police to come over in the daily boat from Naples, where they would have been too easily distinguishable, he telephoned to the mainland that a group of detectives should cross at night by aeroplane and land on some unfrequented part of the island.

The aeroplane duly arrived with its complement of detectives. They marched to the gaming-house and effected the surprise, arresting a number of gamblers and closing the house, which—for the sake of truth—it must be admitted was being kept by an Englishman long resident in Capri. This is perhaps the first time that the police have arrived on the scene in an aeroplane.

Some Coming Dinners.

It is proposed to give a dinner on Oct. 3rd to all past and present officers of No. 1 Stores Depot, Royal Air Force, Kidbrooke, S.E.3. The dinner will be held in the Officers' Mess. Will any Officer who has not received an invitation, please communicate with P. M. C.?

A reunion dinner of the Officers of D Squadron, No. 2 Wing, R.N.A.S., will be held on Friday, Oct. 3rd, at the Restaurant Frascati. Applications for further particulars should be sent to Capt. J. A. Yonge, D.F.C., c/o The Eastbourne Aviation Co., Eastbourne.

It is proposed to hold a dinner at Princes Restaurant, Piccadilly, on October 10th, for the members of 208 Squadron. Will those wishing to attend please communicate with Lieut. H. A. Zinn, No. 208 Squadron, Netheravon, Wilts, as soon as possible, enclosing £2 10s.?

The WORLD of AERONAUTICS (continued)

More Scandals.

R.A.F. scandals have—naturally enough—to move to the rear in the presence of a national railway strike.

This is a matter for some regret. One cannot, under the present circumstances, adequately deal with the overwhelming scandal of the effective suppression of the country's air forces just in time to prevent their taking a proper share in the reconstitution of national transport during the railway crisis.

There was one sage who remarked that a people obtained the Government they deserved, and one who remarked that the British Isles was inhabited by forty million people, "mostly fools." The writer fails to remember accurately whether these two sages were or were not one, but himself living somewhere in the vicinity of the Chelsea football ground he is firmly convinced that one was the yclept of Chelsea.

Whether the question be one of equation or identity matters little—Britain is certainly inhabited by several fools and governed by fewer but more foolish fools.

It is a little difficult to discover whether Britain at this moment is governed by Mr. Lloyd George in fear of the Northcliffe Press, or by Lord Northcliffe in fear of Mr. Lloyd George. Which, however, seems to matter little. Government of fools for fools by THE fools undoubtedly sums up the present state of affairs with reasonable accuracy.

The "Times" and Mr. Lloyd George may be left to discuss the identity of the last-named party to the affair.

In the meantime an article which appeared in the "Times" of Sept. 27th may be adduced as evidence—circumstantial perhaps, but at least illuminative—to any who wish to inquire further into the question.

After a little wail—it certainly cannot be dignified by the Timely epithet of "thunder"—about thousands of young W.R.A.F. women—and others—who were daily conveyed from Reading to the Didcot stores of the R.A.F. by special train, it proceeds to an equally anæmic squeak on the subject of the tons of stores rotting at the Army Ordnance Stores at the latter place.

It is even stated that "a gentleman . . . was shocked" to see the waste going on.

It is, of course, unfortunate that gentlemen should be so easily shocked—it is more unfortunate that in all probability quite a large number of them will be even more shocked within the next few weeks—but it is even more regrettable that a paper with a world-wide reputation such as that once enjoyed by the "Times" should be able to combine in one and the same article an hysterical plea for the instant dismissal of Government servants employed upon the necessarily complex work of winding-up the war and a shriek about the waste resultant from a premature dispersal of an exactly similar staff, without any visible loss of prestige.

The article in question begins with a description of the arrival at Reading at 6.10 p.m. on Sept. 26th of a special train of fourteen or fifteen coaches laden with W.R.A.F.s from the R.A.F. Stores Depot at Didcot.

It moves on to state that "There are those, however, who feel that . . . the presence of so many girls in khaki and blue ten months after the signing of the Armistice is unwelcome to the local branch of the Comrades of the Great War—many of whom are still unemployed . . .

"From what can be gathered in Reading the women are not at all anxious to be demobilised. The majority of them belong to the factory working-class and apparently they can earn more in uniform then they can do as civilians."

Thus it would appear that the real complaint is the not unusual one that the women had rather more horse-sense than the male members of the Comrades of the Great War, who failed to recognise this great truth. This in itself is a quite legitimate cause of complaint—no self-respecting man can properly tolerate such evidence of his incapacity.

However, it seems rather unwise on the part of the "Times" to publish in the same article the fact that valuable stores are rotting in the adjacent Ordnance Depot, particularly when it proceeds to state that at that depot hundreds of men—mainly discharged soldiers—are employed at the latter establishment, together with a comparatively small staff of men of the Army Ordnance Stores.

It may be safely assumed that there is no such obvious evidence of waste at the R.A.F. Depot or the scandal-monger of the "Times" would have mentioned it. It must therefore be assumed that the "Times" desires the R.A.F. Stores to assume the aspect of the Ordnance Stores. It may thus secure both the goodwill of the Comrades of the Great War and a further Didcot scandal about which to yowl.

But, speaking purely from an editorial point of view, one would certainly advise the "Times" to sack whoever was responsible for combining the two stories. Had they been well separated they might have passed—but, really, it is too easy. After all, a bad editor is a more serious matter than a weak policy—and this looks like a combine.

A Rumour.

It is rumoured that Vickers Ltd. have received orders for a semi-rigid airship for Japan and a rigid airship for the United States of America. It is extremely comforting to hear that at least somebody realises the importance of lighter-than-air craft, but it would certainly sound more comforting if these orders had been given by the British Government. Anyway, these present orders will certainly keep in employment a large amount of skilled British labour for such a time when our authorities recover from their orgy of false economy.

The Aeroplane of the Future.

In an interview given to a representative of the "Evening News" Mr. Handley Page is reported to have said that there are many problems to be solved before anything is to be gained by building really gigantic machines.

"One has only to look at the history of the motor-car," he said. "We started with a 6 h.p. car carrying four and five passengers, and running the engine to its utmost capacity, and by stages we got on to the 100 h.p. racer.

"But time has proved that for efficient working the car of about 20 h.p. is the most practicable. It will be exactly the same with aeroplanes.

"We shall get the freak machines, but I feel convinced that the moderate-sized craft for about eight or ten passengers is what is wanted for commercial work.

"Mr. Fokker's fighting aeroplane of the future is far more feasible."

"The only speed limit to an aeroplane is your pocket-book, and the increasing development of wireless makes it highly probable that the big bombers will be controlled from the ground.

"The vision of aeroplanes screeching through the air at anything up to 300 miles an hour, big guns as old-fashioned as spears, and infantry as mere passive armies of occupation, is something for the League of Nations to see about."

A National Effort.

Were the British Industries Fair, which is to be held from Feb. 23rd to March 5th, 1920, a private enterprise, it would still be entirely worthy of support; but being, as it is, a National effort, it is, undoubtedly, the duty of both manufacturers and Press, to leave no stone unturned to help forward its success. It is understood that the Board of Trade are sending out over 100,000 invitations to buyers at home and abroad, which, of course, is all to the good; but, if we, as a nation—for that is what it amounts to—invite such a congregation of buyers to attend a Trade Fair, it is up to us, also as a nation, and individually, too, to see that the exhibits we are calling them to view and, in every trade effected, fully represented.

Speaking for a moment of one section of the Fair—that of Birmingham—it is stated that the management are making strenuous efforts to avoid any weakness in this direction, and that one of their greatest handicaps is the apparent inability among potential exhibitors to realise the actual position. In Birmingham, the Chamber of Commerce and Municipality are jointly responsible for the organisation of this section of the Fair, and one willingly supports their efforts to spread, far and wide, the knowledge that this is a national affair, which knowledge alone will prevent that unrepresentativeness of the various grouped exhibits which will eventuate if all the leading concerns in each Industry do not place their products on view in either one or other of the three centres over which the Fair is divided—London, Birmingham, and Glasgow.

In short, if the British Industries Fair is to impress the buyers of the world with the wide range of our manufacturers' activities and the high standard of their products—if, in fact, it is to serve its purpose fully—there must be no hesitation among possible exhibitors, and there truly should be none among those who think nationally and not parochially.

Foolish Questions.

The booking agent of a well-known passenger air line has sent to the American "Aircraft Journal" the following samples of questions asked by prospective passengers:

"If I take my dog with me, do you think he will get sick?"

"Must I take Motherill's seasick remedy before I go up?"

"Can I step off to see a friend on the way down?"

"If I get killed do you have to go to prison?"

"Are your pilots blonde or brunette? I read in an article that only blonde pilots made good overseas."

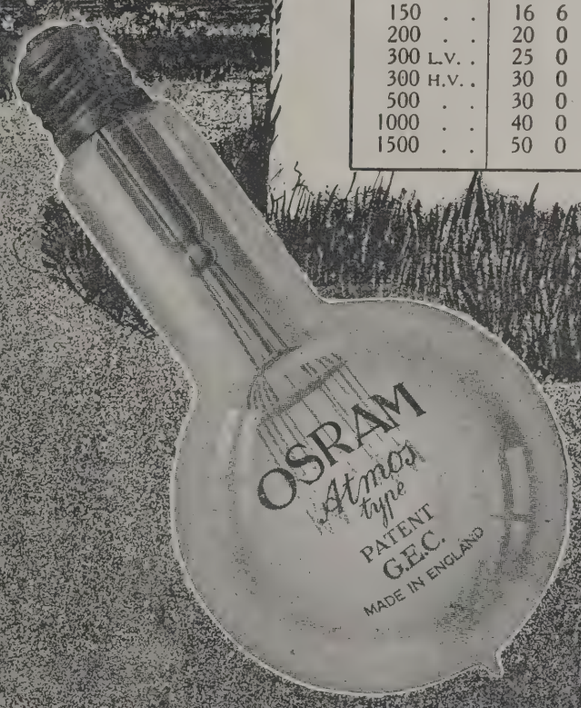
"What happens if your engine stalls while we are in the air?"

"Will you promise not to fly too high?"

"How often have you been hurt?"

"Supposing I change my mind at the last moment, do I have to pay?"

The First Milestone in Post War Lamp Production



IMPORTANT REDUCTION IN PRICES

On and after October 1st, 1919, the prices of

Osram G.E.C. Lamps
Atmos type

will be reduced as follows:—

Rating in Watts.	REDUCED	
	From	To
15 . .	4 6	4 3
30 . .	5 6	5 0
60 . .	6 6	5 6
100 . .	12 6	10 6
150 . .	16 6	13 6
200 . .	20 0	16 0
300 L.V. .	25 0	20 0
300 H.V. .	30 0	20 0
500 . .	30 0	24 0
1000 . .	40 0	30 0
1500 . .	50 0	37 6

The above substantial reductions have been rendered possible through further technical progress resulting in improved manufacturing methods, combined with considerably increased output.
In pursuance of a pre-war policy the benefit thereof is at once offered to the user.

ADMIRALTY APPOINTMENTS.

The following appointment has been made :—
SEPT. 25th.—Payt. Mid.—H. C. Hobson, to "Argus," Sept. 24th.

MILITARY.

OFFICIAL COMMUNIQUÉS.

The following official communiqué was issued at Simla on Sept. 22nd : Raiders on the 19th inst. attacked the Zarkani post. An aerial reconnaissance was made on the 20th, but nothing was seen of the enemy.

* * *

THE CASUALTY LIST.

... ... —*Reported Sept. 30th.*

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Muir, Sec. Lt. J. W., R.F.C.

A PROMOTION.

Lieut.-General Sir David Henderson has been promoted by M. Poincaré to the rank of Grand Officer of the Legion of Honour.

AIR FORCE.

THE BOMBING OF KRONSTADT.

British aviators are still bombing Kronstadt. It is now reported that from 140,000 lb. to 180,000 lb. of bombs have been dropped on the fortress.

A FATAL ACCIDENT.

On Sept. 28th a British aeroplane, while taking off in the neighbourhood of Lake Bracciano collided with a tree and caught fire. The pilot, Capt. C. H. Darley, D.S.C., D.F.C., R.A.F., was killed, and the observer, Lieut. Curtis, R.A.F., was injured; a mechanic who formed part of the crew was unhurt. The machine was on its way from London to Cairo.

AN ACCIDENT IN ITALY.

On Sept. 23rd the petrol tank of an R.A.F. motor launch lying off Poole exploded and the vessel caught fire In spite of the efforts of the crew, the launch was burned to the water's edge, and four men were badly injured.

The names of the airmen are :—Serjeant Thomas Bunting, and Leslie Boorman, David Spence, and William Rumbler.

BRITISH AIRCRAFT AT ST. RAPHAEL.

Three British aeroplanes said to be of the Vickers "Vimy" type left St. Raphael recently. One of these machines is stated to have made the journey from Lyon to St Raphael in 2 hours 30 minutes.

THE OLYMPIC GAMES.

A meeting of the British Olympic Council was held on Sept. 23rd in connection with the revival of the Olympic Games at Antwerp next year. The R.A.F. was represented by Major Clarke, Chief Inspector of Gymnasia, R.A.F.

THE W.R.A.F.

It is, more or less officially, stated that the strength of the W.R.A.F. has fallen to 13,345 since the Armistice. Before that date the strength was 25,600. The Force is to be still further reduced, namely, to 3,298, immediately, and it is hoped that the remainder will be demobilised by April 1st, 1920. The entire disbandment is necessitated by the reduction of the Air Estimates from £66,500,000 to £25,000,000.

R.A.F. PAY.

The following letter has been received :—

Sir,—In your issue of July 23rd, you publish with little or no comment the long-awaited and eagerly expected new rates of pay for Officers of the Royal Air Force. It appears to me that there are two points about these new rates which are open to some criticism, and to which more attention might be drawn.

The first is that no additional Flying Pay of any sort (whether in the form of "risk pay" or otherwise) is allowed.

The second (and it really arises from the first) is that from a comparative point of view the rates of pay are unexpectedly low as far as Officers—and particularly Officers of higher ranks—of the late flying branch are concerned.

As regards the first point, we know that in the ideal Air Service all Officers of all ranks, and whatever their other specific duties, will all fly equally; and there is no doubt that it is the desire and intention of the present Air Council to form such a Service.

I am inclined to think, however, that in this imperfect world such an ideal Service will never be realised, and that it will be found again (as it has been in the past) that office work and flying will not go hand-in-hand.

A pilot who is employed for any length of time on an administrative job either hates his job or loses interest in his flying. As there will always be so many administrative jobs to be filled, and probably also so many ex-pilots ready and willing to fill them, why try to adopt the most difficult course of expecting all Officers to fly, whatever their work?

Another reason against the scheme is that it closes one of the few possible openings for the continued employment in the Service of ex-pilots, and brings these Officers even more up against a blank wall should their nerve give out, or they have to discontinue flying for any other reason.

All things considered, I think that if Officers are to be attracted to fly and to continue flying, it will again be found necessary before very long to make some differentiation between flying and non-flying jobs, and either to reduce the pay of non-flying jobs (which would probably not be possible), or to re-introduce in some form or other a system of "flying pay for flying risks."

As regards my second point, comparison of the new rates of pay with the old will show that the new pay has been fixed at a rate very little higher in the junior ranks and not at all higher in the senior than the old scale of flying pay.

Thus, a Captain "flying" gets a rise of 4s. a day, a Major 2s. (or only one shilling if he is an ex-R.F.C. or R.N.A.S. Squadron Commander), and a Lieut.-Colonel no rise at all. In all cases, of course, the bonus which has been paid since Feb. 1st this year is dropped altogether.

Many people will say, and most others will, no doubt, agree, that a Lieut.-Colonel, R.A.F., or Wing Commander, R.F.C., or R.N.A.S., was grossly overpaid in the past. This may or may not be; but the fact remains that since 1914 his rate of pay has been 40s. a day, and it is probable that his expenditure bore a fairly close relation to his income. Similarly, a Major, R.F.C., or Squadron Commander, R.N.A.S., has drawn 33s. a day since the same date. Now, after some five years with all prices doubled and all the world talking of or demanding (and getting) higher wages and increases of pay all round, the Lieut.-Colonel gets no increase at all, and is 5s. 6d. down on the pay he has been drawing since February this year, while the Major gets a rise of 1s. or 2s., and, at the same time, loses the 5s. he has also been getting since February.

To put the matter in even a worse light.

Presuming that the rates of 33s. and 40s. were fixed before the war with due regards to the duties and responsibilities of the ranks (which, as mentioned above, many people will, no doubt, deny), and taking the favourite economic argument of Labour leaders, that £1 has only the purchasing-value of 10s. before the war, it will be seen that the £730 per annum which a Lieut.-Colonel drew before the war is now only worth £365 per annum, and yet he is to get no increase.

Not only that, but next year, when all Officers come on to the civilian rates of income-tax, the unfortunate Majors and Lieut.-Colonels (if still in the Service, which is questionable) will lose heavily, even on the face value of new rates as compared to the old.

This seems to me to be entirely wrong; but as the Officers concerned form so small a proportion of the whole, they will, no doubt,, get neither sympathy nor redress—in fact, they will probably be told that they are lucky to be allowed to retain the vast rates of pay that they have undeservedly been getting in the past!

All the same, it is a little hard for any Officer, of whatever rank, to find that the much-heralded increase of pay which he had been led to expect turns out to be for him, personally, such a very "Dutch" rise, resulting in an actual dead loss!

Incidentally, it is interesting to note that the new R.A.F. rates correspond very closely with the new Naval rates.

Presumably, the new Army rates will also be on similar lines, which means, I suppose, that in the opinion of the powers that be the Air Force is no longer a Service of special

danger. This should, at least, be a good advertisement for the safety of flying!

Yet Naval Officers in submarines still get 4s. a day "risk pay."

Also, a Commander, R.N., draws extra "Command Pay," in addition to his 40s. a day if in command of a ship. By the same reasoning, why should not a Lieut.-Colonel, R.A.F., get "Command Pay," in addition to his £2 when in command of a Wing or Station?

(Signed) MAJOR, R.A.F.

AIRSHIP COMMISSIONS.

The "Evening News" (of Sept. 25th) understands that "the number of permanent commissions to be granted in the Airship Branch of the R.A.F. has been fixed at 30, against the 6,000 granted during the war and 150 in pre-war days."

[One doubts if there was anything like one hundred and fifty airship commissions in pre-war days.—ED.]

FRANCE.

A scheme is under consideration by the military authorities by which demobilised military aviators will be given the opportunity of keeping in touch with flying in general. Two solutions are suggested :—(1) to fix regular periods in which aviators can report for training, etc., and (2) to place at aerodromes near various centres a certain number of military aeroplanes at the disposal of aviators living in the district.

FRENCH AIRSHIP CONSTRUCTION.

At the recent reception given to M. Bossoutrot on his return from Dakar by the French Aero Club, General Duval stated that France had given an order for the construction of six rigid airships of 70,000 cubic metres capacity.

A CONVICTED GERMAN AVIATOR.

Heinrich Frey, a German aviator, has been convicted by court-martial at Amiens of a series of thefts at Soissons and has been sentenced to ten years' hard labour, twenty years' exclusion from France and a fine of 5,000 francs.

THE FIRE AT LE BOURGET.

A serious fire occurred at Le Bourget Aerodrome, near Paris, on Sept. 25th. Soldiers and firemen from Paris contrived rapidly to extinguish the flames. The Le Bourget Aerodrome is the French terminus of the London-Paris Air Service; luckily no stoppage was caused to that service by the fire.

The fire occurred in the Réserve Générale Aeronautique and destroyed a wooden workshop, several machine tools, six motor-cars and three reconstructed aeroplanes. The total damage is estimated to cost 800,000 francs.

ITALY.

THE ITALIAN SEAPLANE SQUADRON AT E.L.T.A.

It appears that, by the efforts of Nav. Capt. Gravino, attaché at the Stockholm embassy of H.M. the King of Italy, the seaplane squadron now at the E.L.T.A. Show, when it leaves, will fly on to Sweden, for commercial propaganda.—T. S. H.

GERMANY.

A BANK-BREAKING VENTURE.

Mr. H. Patrick Devitte, the "Daily Express" correspondent in Geneva, writes on Sept. 27th :—

The Rumanian Bureau at Berne informs me that Rumanian troops yesterday seized a great German biplane with four motors, which was forced to descend at Hotin, in Bessarabia, owing to a leakage in the petrol tank. The biplane contained 300,000,000 roubles (nominally £30,000,000) in new notes, also a complete miniature printing press for the manufacture of notes.

Four German officers who were in the aeroplane were flying to Moscow. They were arrested, and the biplane, notes, and press were seized. This incident proves the relations existing between Berlin and Moscow.

[It seems more likely that the intention was to flood Russia with bogus Bolshevik notes and so help to break the finances of the Bolshevik tyranny.—ED.]

U.S.A.

It is now announced that recruiting for the U.S. Army Air Service has been discontinued according to the instructions of the War Department. This Service has been decreased by 91 per cent. since the Armistice. The following figures of comparison are given :—

Of 195,023 officers and men in the service on Nov. 11th, 1918, but 16,991 remain, of whom 3,426 are officers. Of the 15,646 commissioned officers discharged, 1,638 flying and 1,524 non-flying have entered the Reserve, 20 per cent. of the number discharged.

Since April 1st, 10,000 hours not chargeable to training have been flown at the United States Flying Fields, with 37 fatalities. This shows a high fatality rate of 269 hr. per fatality as compared with 3,149 hr. per fatality for all flying during the last five months of the war.

A CROSS-COUNTRY FLIGHT.

According to the "Aircraft Journal" of America :—

"More than two and a quarter miles a minute is the speed record made by Lieut. Lyman Paterson, of the United States Army, flying from Washington to Langley Field. The 160 miles distance was covered in 70 min., according to an announcement made by the Air Service. It is pointed out that by maintaining this speed it would be possible to cross the Atlantic in considerably less than 24 hours."

One agrees that at this speed the Atlantic could be crossed in "considerably less" than 24 hours.

"ALL THINGS BRIGHT AND BEAUTIFUL": A Group of Aviators of the U.S. Naval Air Service. It is alleged that each of them is the son of a millionaire.

London-Paris Air Express

Summary of First Five Weeks' Flying.

August 25th, 1919, to September 27th, 1919.

Flights Scheduled	69
Flights accomplished	66
Prevented by weather . . .	2
Interrupted by mechanical defect	1
Number of Miles flown . . .	16,500
Average Speed (Miles per hour) .	107

The following is an official summary of the weather flown through during the first five weeks.

Days favourable for flying	3
„ unfavourable for flying . . .	18
„ noted officially as "unfit" for flying .	9

The attention of Bankers, Merchants, and firms which have houses both in London and Paris is again drawn to the unique facilities afforded by this service, which permits urgent documents, express goods, or passengers to be transported the 250 miles between London and Paris in an average time of 2¼ hours. The service, which has been operating daily since August 25th, has been started in order to demonstrate that, with the use of skilled pilots and fast machines, such an express air service can now be run with sufficient reliability to afford a definite, daily convenience to the business world.

PARIS:
COMPAGNIE GÉNÉRALE TRANSAERIENNE,
118, Champs Elysees.

THE ROYAL AERONAUTICAL SOCIETY IN SCOTLAND.

On Sept. 24th, at Glasgow, the Scottish branch of the Royal Aeronautical Society entertained to luncheon the officers and crew of the Clyde-built airship, "R.34." Sir William Beardmore, whose firm built the airship, presided, and was supported by Lord Blythswood and others.

Sir Robert Horne, Minister of Labour, proposed the toast of the day, and said that Britain had beaten the Germans in the airship, which was our special pride, and the nation was under a debt of gratitude to her intrepid crew.

Major Scott, the commander, acknowledging, said civilian-owned airships would, for a long time, go along the lines of the designs of naval and military craft. Any support civilian owners got from the Government would be of the utmost national importance, because, in a few days, civilian airships could be converted to war craft.

The Marquis of Graham, replying to the toast of "The Builders," said the outlook for the development of commercial aviation was illimitable.

Sir William Ramsay, speaking of the Society, said the aeroplane constructed five years ago was still the most suitable, the most steady, and the safest machine heavier than air. This was the type of machine which had to be developed, and not the light, swift machine, which could do wonderful stunts and paralyse an opponent in actual fighting.

In the evening a public welcome was accorded the crew in St. Andrew's Hall, Glasgow, when amongst the speakers were Sir William Beardmore, chairman, and Sir Robert Horne. Lord Weir, who had been suddenly called to London, was to deliver an address, which, however, was read in his absence.

The King's Congratulation.

King George sent the following telegram :—

The King has received with much pleasure and satisfaction the loyal message from the citizens of Glasgow assembled this evening at the invitation of the Scottish branch of the Royal Aeronautical Society to do honour to the first British airship to cross and recross the Atlantic, and, thanking them for their assurance, His Majesty heartily joins in congratulating the designer and all those associated with the construction of this airship, on the remarkable success it has achieved, and is glad to think that the Clyde has played so prominent a part in establishing this fine record in the annals of British history. The King much appreciates the kind allusions to Prince Albert.

Progress in Research Work.

Lord Weir, in his paper, which was read by his brother, said the chief deduction he drew for the future was the one which the war made perfectly clear—namely, the supreme necessity of the strictest vigilance in the development of research and experiment. Whatever influence the exigencies of the moment might exercise on retrenchment, there must be no reduction of our expenditure on technical development. War was the compelling influence of the intensification of our technical effort

Referring to the immediate future of civil or commercial aviation, his lordship confessed he was a genuine believer in the future of civil aviation. He accepted flying seriously as an ultimately invaluable system of achieving high-speed transport for goods and passengers. He had an unflinching faith that aircraft comprising heavier-than-air or lighter-than-air craft would ultimately confer a genuine boon on civilisation. Early progress in civil aviation would, to the uninitiated, appear slow and unsatisfactory.

An aerial transport company to-day was like a merchant shipping concern without ports or harbours. Regarding commercial aviation, he thought only of the practical and utilitarian aspect of regular services, carrying goods and passengers. He fully recognised the immediate development and wholly admirable and profitable small ventures which would take place in the application of aircraft. For example, he looked to a considerable development on the sporting side and in the personal use of aeroplanes by the not inconsiderable number of those who were pilots during the war. For photographic and survey work a definite field of enterprise and usefulness was open.

Aerial Mail Service.

An increase in the rapidity of communication and of transport would be one of the most definite aids to the progress of civilisation. Mail matter would represent the most favourable class of work as a source of revenue. Thereafter would come urgent and emergency passenger work, e.g., the carriage of goods of a light, valuable, and specialised nature. The vagaries of our climate and the highly developed and speedy existing mail transport rendered the immediate application of aerial mail-carrying in the United Kingdom improbable.

After referring to the performances of the new London to Paris service, his Lordship said they must also realise the tremendous usefulness and value of obtaining actual experience on a more ambitious scale as early as possible. With that in view, one visualised the problem of handling, say, a part of the Indian mail over the section of the route where weather conditions are favourable and uniform at an early date.

If that route were started from Egypt to Karachi, that would constitute the initiation of a chain of Imperial air routes connecting by trunk lines the main units of the British Empire, and they would foresee, in addition, auxiliary feeder lines to and from the smaller centres. There were also many independent services. The most favourable he considered to be the coastal work service in Australia and the West Indies. At present he had the greatest faith in the usefulness of the coastal sort of flying-boat.

The Military Aspect.

As regards Imperial air routes and civil aviation, there entered into the problem the important factor of the future military aerial activities of the Empire. Whatever sum might be apportioned for the defence of the Empire would be allocated between air, sea, and land power, and it was clear that air power was the developing factor of the three. Accordingly, for strategical reasons alone, the different units of the Empire would require to be linked up by definite aerial routes, which would be found to a great extent to coincide with the commercial routes.

As to the State's part, he repeated that the best ends of civilisation would not be served by keeping civil aviation for a Government monopoly. Co-operation between the activities of the State and of private firms would produce the best results. The State must be the pioneer. It must help to build, encourage, and exercise control, but emphatically it must not monopolise.

BRITISH SUPERIORITY.

The "Times" of Sept. 20th referred to the success of the British-made aeroplanes at the E.L.T.A. as follows :—

"Mr. Kenworthy, better known during the war as Commander Kenworthy, states that shortly after the exhibition opened he found the Dutch were mad on the Fokker. The British, however, were not slow in changing this, for a few days after English airmen had been in the air the Fokker was not in the picture. From the first there was absolutely no doubt as to the superiority of the British machine over that of the Fokker type. Without presuming in the least, he could say they beat the lot.

"Mr. Kenworthy, who flew a Kangaroo machine made by the Blackburn Aeroplane Company, said he took eight passengers with him on many flights. When they were coming home they flew in a thick fog at Calais. When halfway across the Channel he and Capt. Woolley, who accompanied him, had something of a scare, for they discovered they had only sufficient petrol to last for another 10 minutes. The fog still surrounded them, and the wind was against them, so they decided to turn back. Top speed had to be resorted to and he calculated that they flew back to Marquise at a speed of 150 miles an hour, for in five minutes they landed. Before they left Amsterdam he and other English pilots received an invitation to meet M. Fokker at dinner, but, added Mr. Kenworthy, 'we refused the invitation.'"

[But for the fact that Mr. Kenworthy was never known as "Commander"—never having held that rank—the "Times" statement is instructive and amusing.—Ed.]

NO TRESPASSING.

Perhaps the first "No Trespassing" sign intended as a warning to aviators has been seen by Mr. G. F. Scales, president of the Miller-Scales Aero Co., of Waterloo, Iowa. The notice read :—

Keep Off This
Farm With Airoplain.
No Trespassing Allowed.

The owner of the farm had not actions for damages in his mind, for in attempting to settle with him for a landing the farmer insisted that he had all the money he needed, and that his livestock did not care to mingle with aircraft, to which they were not accustomed.

The "Aircraft Journal" of America" remarks : That this question will come up again can hardly be doubted, for court action has already been brought which will determine whether a property owner is also owner of the air above his land. Frederick Hoenemann, a farmer near Kansas City, Mo., is seeking to restrain an aeroplane company from using the air above his farm.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

A paper read by Wing Commander T. R. Cave-Browne-Cave, R.A.F., before the British Association at Bournemouth is reproduced at some length below.

This paper will be found to contain a large amount of information as to the practical difficulties met with in the design and operation of airships.

The question of various methods of compensating for the weight of fuel consumed, without discharging hydrogen, are of great importance, and are touched on by the author.

Wing Commander Cave's remarks on the subject of the fire risks in airships are reassuring and comforting, and his demonstration of the advantage of increased size in airships is simple and convincing.

The war-time products of the Sopwith Aviation Co., Ltd., are briefly described in this week's article on "Modern British Aeroplanes." Mr. T. O. M. Sopwith, the founder of the firm, was one of the earliest of British pilots, and his achievement of December 18th, 1910, in flying from Eastchurch to Thirlmont (Belgium), 169 miles, on a 60-h.p. Howard Wright biplane must be regarded as one of the finest of the early British performances.

The success that has attended his later efforts as a constructor of aircraft must be regarded as a fitting reward for his pioneer efforts of early days.

A German criticism of the Liberty engine appears on page 1266.

AIRSHIPS.

By Wing Commander T. R. CAVE-BROWNE-CAVE, C.B.E., R.A.F.

A lecture delivered to Engineering Section "G" British Association.

INTRODUCTION.

Airship development has depended very largely upon the work, not only of those scientific men whom we have been able to have in the Service during the war, but of the many others who have given invaluable assistance on an enormous variety of matters. The future development involves even more scientific problems, and I have framed this lecture to include, not the points of most general interest, but mainly those difficulties of greatest interest to the scientific world which we know from experience is always ready to help. The circumstances governing the variation of static equilibrium of an airship will be discussed.

AIRSHIP FABRICS.

The principal difficulty which is experienced with the use of airships for long periods, more particularly in tropical countries, is the deterioration of the fabric under the action of sunlight. This deterioration takes two forms, firstly the strength of the textile material is decreased, and secondly the gas-holding properties of the proofing material are destroyed.

The rigid airship contains a large number of gasbags formed of the lightest possible gastight material. This is usually a very light cotton cloth proofed with goldbeaters' skin stuck to it by means of rubber solution. The skins are then varnished as a protection against moisture. The actual tensile strength of this fabric is only sufficient to prevent damage during the motion of the gasbags in the ship's framework.

The outer surface of the ship is formed by an outer cover of linen of much the same strength as that used for aeroplane wings. The duties which this outer cover has to perform are very important. It has to be stretched sufficiently tight to prevent any flapping or appreciable deformation during the passage of the ship through the air. It must be waterproof and also water-repellant in order to reduce the weight added to the ship by a shower of rain. A further function, and one very difficult to fulfil, is the protection that it has to afford to the internal gasbags.

The outer surface of the non-rigid ships is made with a shining aluminium finish so that as much as possible of the heat and light is reflected. The rubber immediately under the surface is made to contain considerably more litharge than otherwise necessary, as this material absorbs a large proportion of that light which passes the reflecting surface. A similar system is being followed with the outer covers of rigid airships, and judging by the excellent results obtained from somewhat similar methods employed on aeroplane fabric, the protection both to the fabric of the cover and to the internal bags should be very good.

Experience with rigid outer covers is at present small, but it has been found that with non-rigid envelopes made by our latest methods of proofing, the deterioration of the outer surface becomes clearly visible before any serious loss of strength has taken place.

The envelope of a non-rigid ship is formed of layers of fabric which have to be of considerable strength in order to resist the small internal pressure necessary to maintain the rigidity of the ship. Between these layers of fabric is placed one or more layers of gas-tight rubber.

The strength of a fabric envelope can be calculated with considerable accuracy if it is assumed that the fabric is undamaged. The reduction of strength caused by a small local wound is, however, very considerable, because such a wound causes concentration of stress at the edges of the hole, and there is a tendency for the fabric to rip. This dangerous concentration of stress can be very largely avoided in a two-ply fabric if the threads of one-ply are laid at 45 deg. to those of the other. The threads of the diagonal ply then form an effective means of distributing the stress, and also when tearing actually begins tend to form together into a bunch which exerts considerable concentrated resistance to the extension of the tear.

The following table shows the reduction of strength caused by a ½ in. wound cut in a 6-in. strip in a direction at right angles to the direction of the stress.

Fabric.	Strength wounded. / Strength unwounded.
Single ply cotton	0.39
Single ply linen	0.52
2-ply parallel CC.	0.33
2-ply diagonal BD.	0.57
2-ply diagonal CC.	0.72
3-ply diagonal CCC.	0.68

The strength of the fabric used in the envelope of the "N.S." airships is 1,770 kilos. per metre, i.e., 100 lb. per in.

The stress in an airship envelope is very largely determined by the internal pressure which it is necessary to maintain in order to keep correct shape. The circumferential stress which this presure produces in the fabric is, like that in an ordinary boiler shell, about twice that in the longitudinal direction. Ordinary fabric is usually about equal strength in the warp and weft directions, and in order to resist the circumferential tension the envelope has to be made with a quite unnecesary longitudinal strength with a consequent increased weight.

It has been found possible to reinforce an envelope by means of flat bundles of string placed circumferentially round the

envelope at suitable intervals, so that these strings contribute the difference between the circumferential and longitudinal tensions. The fabric, therefore, need only be made sufficiently strong to take the longitudinal tension. This system of reinforcement has not at present been tried on a full-size envelope, but was found to give very satisfactory results when adopted on 20-ft. model envelopes which were tested to destruction.

In considering the best material for envelope reinforcement, very careful attention had to be directed to the tensile strength of a material compared with its weight for a given length. This was found to be most conveniently represented by the length of the strand which would hang vertically down without breaking under its own weight. This was termed the breaking length of the material. Values for some usual materials are given in the table :—

Material.	Breaking length in metres.
Thread, 3-strand cotton	12,600
Thread, 3-strand flax	15,900
Thread, 3-strand hemp	12,800
Pain's light rocket cord	28,600
Best Italian hemp cord	27,500
Airship cotton fabric	10,000
Aeroplane linen fabric	14,000
Envelope fabric (proofed)	4,000
Reinforcing string tape	12,600
Aluminium 10 tons/in.	6,400
Duralumin 24 tons/in.	14,400
Mild steel 30 tons/in.	6,200
H/T steel 100 tons/in.	20,600

Gas-Tightness.

The gas-tightness of fabrics and of seams formed in them is a matter which has been very thoroughly dealt with in papers to the Advisory Committee for Aeronautics, which it is understood will be published very shortly. It may, however, be said that the amount of hydrogen which leaks out through the fabric of an airship is a matter of purely nominal importance with fabrics of the excellence now available. The matter of real importance is the passage of air through the fabric into the gas space. This air reduces the purity of the gas, and unless very large quantities of gas are consumed by the ship by discharge through the valves, it is impossible to eliminate this air sufficiently to maintain the gas purity which is necessary to give the ship her lift.

An interesting point which has been clearly established is that the air which diffuses into the gas space tends to collect at the bottom of the envelope, more particularly in trilobe ships where the circulation of gas is less free than in circular envelopes. Samples of gas taken from within 12 in. or so of the bottom of the envelope show a hydrogen purity of some 1 per cent. lower than that in the rest of the envelope. Further the ratio of oxygen to nitrogen in this impurity shows that the air has come in by diffusion and not by mechanical leakage. This puddle of impure gas only collects while the ship is at rest in the shed, and is quickly dissipated as soon as flight is started.

Some of the chemical and physical changes which accompany the loss of gas-tightness of a rubber-proofed fabric are at present very obscure. Loss of gas-tightness appears to proceed very slowly for a considerable time, and then to become very rapid, almost in the nature of a sudden collapse. In some cases the gas-tightness is actually found to increase for a short time after the fabric has been made.

The Effect of Temperature Changes.

The effect of the sun's radiation on the outer surface of the ship produces other important results. It raises the temperature of the gas and the air contained within the outer envelope to a point considerably above that of the surrounding air. This results in what is termed "false lift." Immediately the strength of the sun's ray decreases the superheat begins to disappear, and the false lift of the ship is reduced. The extent of this superheat sometimes amounts to 30 deg. F. to 35 deg. F., corresponding to a loss of some 6 per cent. of the total lift of the ship. A rigid ship flying towards the sun superheats the gas in her forward compartments considerably more than that aft, and a change of trim results. Flow of air over the surface of the ship, and the circulation of air between the outer cover and the gasbags of a rigid ship tend to reduce superheat.

Changes of temperature in which the gas and air readings remain equal to each other, do not involve change of lift unless the expansion of the gas is sufficient to involve discharge of gas from the ship. If the ship becomes light and is allowed to rise higher than is otherwise necessary, much gas may be discharged. If weight can be taken into the ship, so that she does not rise, the loss of gas may be avoided, and this may be of considerable value during the next night when the ship has cooled down, and possibly absorbed moisture.

There are several methods of taking weight into the ship. One is to condense the exhaust, and by this method a weight considerably in excess of the weight of fuel burnt can theoretically be obtained. It is found that the exhaust gas from a 260 h.p. engine can be cooled to within 10 deg. F. of the atmosphere temperature in a cooler weighing about 120 lb. This would, in a rigid airship, take the place of a silencer weighing some 60 lb., and the added weight is not, therefore, very great. The form of cooler used resembles a honeycomb radiator with 1-in. tubes through which the air passes, the exhaust passing through the space around the tubes. There is, however, difficulty in this condensation, because the cooling surfaces rapidly become fouled and conductivity very greatly reduced.

An alternative is to draw water direct from the sea, either by a propeller-driven pump contained in a body towed by the ship and discharging water up a hose, or by filling a fabric drogue

and hoisting the water into the ship by winch. Both these operations involve considerable difficulty in handling the ship, more particularly because at the time she wants water she is seriously out of trim.

Hydrogen as Fuel.

A possibly more promising alternative is to burn the hydrogen which would otherwise have to be discharged, and to condense the water of combustion. This is considerably easier than condensing the exhaust gas, because there will be no fouling of the cooling surfaces.

Experiments have been made on the use of hydrogen as fuel, and considerable success has been achieved. It is found that with very simple gear hydrogen can be burnt in an ordinary airship engine. When burning hydrogen alone it is not possible to develop more than 25 per cent. or 30 per cent. of the power which the same engine would give on petrol. If greater power is attempted serious detonation in the cylinder results. By providing a hydrogen-air mixing valve in parallel with the petrol carburetter it is possible to obtain any fraction up to the full power of the engine by suitably proportioning the relative amounts of hydrogen and petrol mixture burnt. The proportion of hydrogen which it is possible to burn depends upon the proportion of full power which is required from the engine. Under all ordinary circumstances a very considerable saving in fuel can be achieved.

The Fire Risk.

The risk of fire in airships has considerably reduced the warlike operations which these aircraft have been allowed to undertake. For commercial purposes some small risk of fire also exists. The proportion of this risk which is due to the presence of hydrogen is, in the case of commercial craft especially, considerably smaller than is generally believed. The engines and other possible sources of ignition are carefully arranged at a considerable distance away from any point at which gas can possibly be discharged, and the speed with which gas when liberated rises clear of the ship is such that only a very serious fire in one of the engine cars could possibly be communicated to the gas.

Although during the war British airships flew nearly 3,000,000 miles the only ships which were destroyed by fire were, one, the first, "S.S." ship which ran into some telegraph wires and caught fire, the crew escaping; two, a coastal ship which landed on the water and caught fire for an unknown reason, and lastly, an "S.S." ship which landed on top of another in a thick fog.

The petrol system is a source of danger which is probably at least as great as that due to the gas. Large quantities of petrol are stored in the keel of a rigid airship, and the petrol system is necessarily connected to the engine cars. The possibility of transmitting fire to the envelope of the ship would be very greatly reduced if paraffin or an equally safe fuel could be employed. The added safety which would be derived from a less inflammable fuel would probably justify some increase in the weight of machinery necessary to develop the required horse-power.

The Importance of Fuel Economy.

It may here be well to draw attention to the relative importance of the weight of the engine and the weight of the fuel consumed. This relation is very different from that which obtains in an aeroplane where the length of flight is considerably less. An aeroplane engine weighs some 3 lb. per horse-power, and may be expected to burn a weight of fuel equal to its own in six or eight hours. The machinery of an airship will, of course, during an ordinary passage run for many times this duration of flight, and further a large proportion of the flight will be carried out at less than the full power of the engines. A "North Sea" airship carried out one patrol of 101 hours, while the flight of R.34 to New York involved a continuous flight of 106 hours. From this it will be clear that an airship engine must be one of the very highest fuel economy, not only at full power, but also at fractions down to 25 per cent. of the maximum power. The increase of weight of engine justified by a small improvement in fuel economy is, therefore, considerable.

Steam Plants.

The use of steam for airship propulsion has been considered, and although the convenience of such a system is very great and the weight of machinery, including boiler and condenser, is not seriously in excess of the corresponding petrol engine, there appears at present no likelihood of reducing the fuel consumption to much less than 1 lb. per horse-power hour. This is clearly prohibitive when compared with the consumption by a petrol engine of less than 0.5 lb. per horse-power hour.

The Design of Airship Engines.

In addition to the requirement of high fuel economy, it is of the greatest importance that an airship engine should be able to run for very long periods without risk of breakdown. A further point is that the engine should be arranged in such a way that all its parts which are liable to failure during running, are made easily accessible, so that a repair can be carried out in the air. This is a very important difference from the aeroplane engine, which is normally inaccessible during flight. An airship engine can be stopped during flight, and must be regarded as at least as easily accessible as that of a motor-boat. The space round it is generally at least as ample, and it is only in exceptional circumstances that the motion of the ship will in any way interfere with the execution of repairs. Defective magnetos have frequently been replaced by others of a different type and the new ones correctly timed. One repair which involved the removal and replacement of one complete cylinder of a two-engined ship, was successfully carried out, and the engine used without trouble for the remainder of the flight. A satisfactory airship engine must, therefore, be one in which repairs, even of this magnitude, can be effected as easily and with as little delay as possible.

Airship Propellers.

The variation of speed of an airship renders the design of her propellers one of very considerable difficulty. She may be required to run on one engine developing its full power and giving the ship a very low speed, or on all her five engines giving her full speed. Under these circumstances the efficiency of her propellers must necessarily be low in some conditions. A satisfactory means of varying the pitch of the propeller should, therefore, lead to a very considerable gain in the efficiency of the ship as a whole. A propeller in which the alteration of the blade angle is sufficient to give reverse thrust would be very convenient, and avoid the reverse gear-box now required.

One Advantage of Airships.

One of the advantages which an airship possesses over an aeroplane is that her greater range will enable her to avoid atmospheric disturbances, and also to take more advantage of any depression which can be approached in such a way as to obtain a favouring wind. Meteorological information can now be obtained from a fairly considerable number of points, but prediction is rendered considerably easier if it is possible to read the barometer at a point on the ground below the ship herself. A barometer reading taken in the ship is, of course, useless unless the height of the ship can be determined by means other than barometric pressure. Instances have occurred in which the barometer has changed so greatly during an airship's patrol, that the ship struck the water during the night when her aneroid registered a height of 300 ft. When crossing an unknown country it is also desirable to determine the height above the ground, independent of the barometer and height above sea-level. To determine this height above the sea, it has been suggested that the report of a rifle discharged in the ship and reflected from the surface of the sea should be timed. A special form of stop-watch, which was used for gunnery research during the war, makes it possible to measure the interval between two similar sounds with an accuracy of within 1/10 second. Up to the present the method has not been found very satisfactory, on account of the difficulty of hearing the reflected report if the ship is not stopped, or her speed seriously reduced. It is, however, possible that in an emergency this device could be used with success by stopping or slowing down the ship. This is, of course, a serious disadvantage to the method, and something better is required.

Hydrogen and Helium.

The generation of hydrogen is probably the greatest difficulty in extending the use of airships to more or less undeveloped countries. Hydrogen at present is manufactured for airship purposes mainly from coke. Some method of manufacturing hydrogen from wood or other vegetable matter would probably prove of very great value in allowing airships to work in those countries in which they have their greatest advantage over other possible forms of transport.

The use of helium has been considered, and much experimental work has been done on the extraction of this gas from the natural gases obtained from wells in Canada and America. The price of this gas, when made by present methods or by any system which appears probable in the immediate future is, however, almost prohibitive, and failing a really remarkable discovery such as the possibility of getting hydrogen to degrade into helium, there does not appear much possibility of reducing the price to a commercial possibility.

Stresses and Construction.

The calculation of the stresses produced in the hull structure of a rigid airship under the many different conditions

encountered is one of considerable complexity, and one which cannot come within the limits of this lecture. The most interesting members of the structure may be regarded as long struts some 16 ft. long, designed to fail, when the ends are supported freely, under an end load of some 8,000 lb., or a distributed load of some 2,000 lb., i.e., 120 lb. per ft. The construction of such a girder has involved several very interesting, though probably not novel, principles. The bracing pieces which have to be made of an easily stamped section, are formed so that their thin edges come in the neutral axis of the piece, and are, therefore, little exposed to secondary bending. The end of the bracing piece is carefully shaped so that the loading is as little eccentric as possible. Bracing pieces are arranged in pairs, and are riveted together where they cross. The piece in compression can then derive support from its fellow, which must at that time be in tension.

An interesting manner of assessing the relative merits of various types of strut is to consider how far the construction allows the material to develop its full yield stress. If a form of construction is such that the crippling load divided by the area of cross section of the strut approximates closely to the yield stress of the material, the form of construction must be considered very good.

The Advantage of Large Airships.

The advantage to be gained, from a commercial point of view, by using a large ship is clear from the following consideration. For ships covering the same range at the same speed and having similar shape, the displacement varies as the cube of the linear dimensions (l^3), the weight of hull, fabric, etc., as l^3, the resistance, and, therefore, the weight of machinery and fuel as l^2

$$\therefore \quad \underset{K_1 l^3}{\text{gross lift}} = \underset{K_2 l^3}{\text{wt. of hull, \&c.}} \quad \underset{K_3 l^2}{\text{wt. of machinery}}$$

$$\text{Weight of fuel consumed} = K_4 l^2.$$

$$\text{Hence} \quad \frac{\text{freight}}{\text{fuel}} = \frac{K_1 l^3 - K_2 l^3 - K_3 l^2}{K_4 l^3},$$

a function which clearly increases with the size of the ship. It is, therefore, interesting to consider what limits the size of rigid and non-rigid ships of the types at present in view.

Practical Limits of Size.

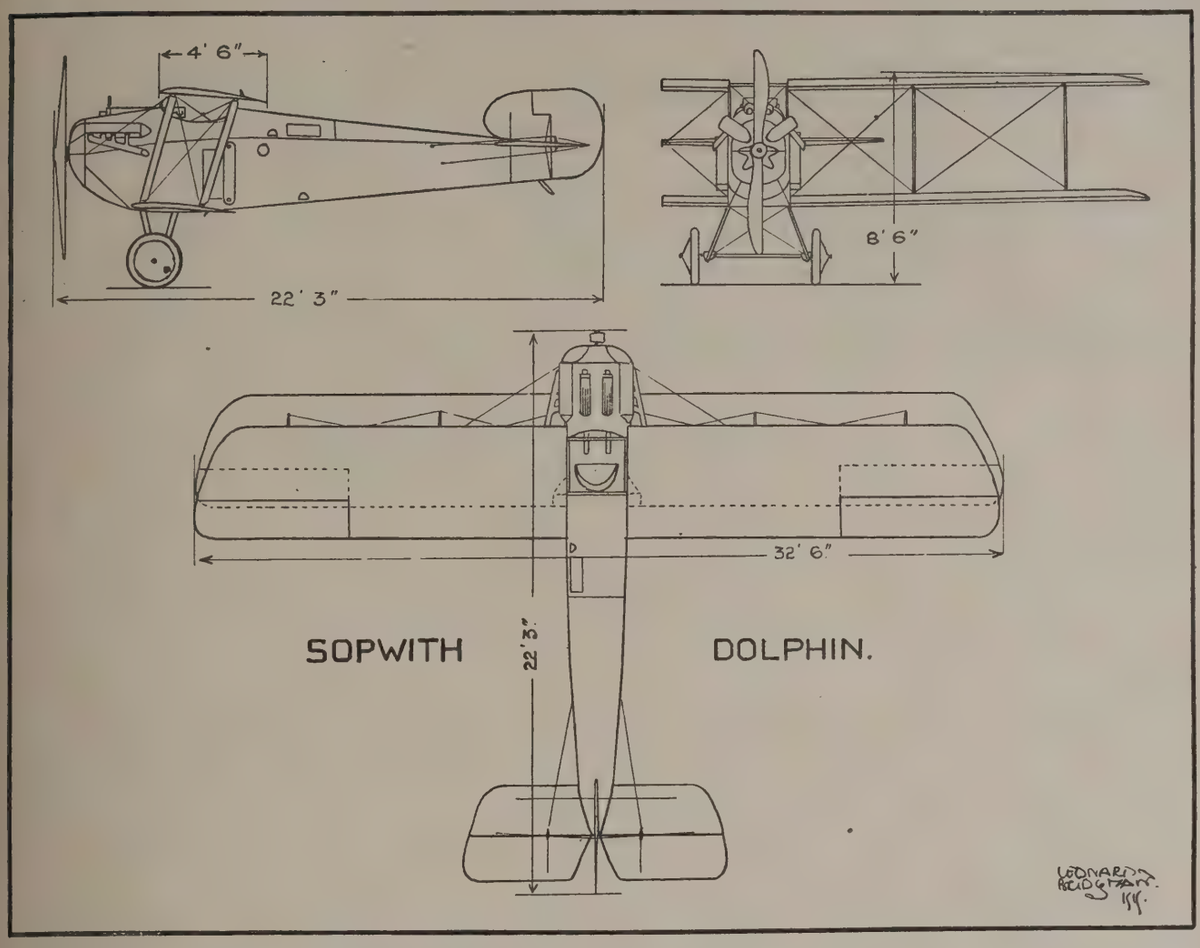
Increase of length of a rigid of given cross section appears to call for no increase in the strength of her hull, provided the load is properly distributed. No serious restriction to the length of rigids is, therefore, in view. The most dangerous stresses are produced in the main transverse members of rigids by unequal inflation of the gasbags on either side of a bulkhead. The bulkhead is formed of wires lying in the transverse plane and attached to the joints of the main transverses. Difference of pressure in adjacent bags, therefore, induces great tension in these wires, and hence compression in the transverse frame. The possible head of gas produced by the total deflation of one bag increases with the ship's diameter, and so does the span of the wires. In a ship of large cross section, therefore, the compression in the transverse frames becomes very serious.

The non-rigid airship is not, as at present designed, divided into compartments by diaphragms capable of resisting a difference of pressure in the gas on either side. If the ship takes up a very steep pitch the internal pressure at the upper end of the ship wil be seriously increased if the pressure at the lower end is still to be maintained above atmospheric. This accumulation of pressure at the upper end of the ship while pitching may prove a serious difficulty in a really large non-rigid, but it is probable that by the employment of a circular section and fabric reinforced in the manner already referred to sizes considerably greater than any we have built at present can be achieved. The development of a large non-rigid offers—at any rate in the author's opinion—very great promise of advantage, because the ratio of disposable lift (fuel and freight) to the total displacement of the ship is so good. A non-rigid of 500,000 cubic ft. capacity, i,e., carrying a useful load of 7½ tons, will have about the same value (50 per cent.) for this ratio as a rigid ship of four times the capacity (2,000,000 cubic ft.).

The slides which followed illustrated various operations carried out by airships during the war. The last one, which showed the mooring of a rigid airship to a mast, is of extraordinary importance. The difficulty of handling a large airship is very greatly magnified in the opinion of most people. The only serious difficulty lies in getting the ship into her shed when a wind is blowing across the entrance. Bringing an airship to the mast where she is always head to wind and the air is not even disturbed by the presence of a shed, is easy. A 60-ton airship lands in equilibrium so that the upward force the landing party exerts is nil. Compare this with even a 20-ton aeroplane touching the ground at 50 m.p.h., and running a quarter of a mile, at the end of which it is pressing on the surface of the aerodrome with its full weight of 20 tons.

The airship shown in this slide remained at her mast for three weeks in charge of watches, each consisting of one N.C.O. and five men. She experienced winds of 35 m.p.h., with gusts up to 43 m.p.h., very heavy rain and bright sunshine, also several thunderstorms, including the very violent one of July 17th, which passed over the ship at 2 a.m. At times the whole ship appeared to be aglow, and it was easily possible to read the instruments in the keel by the light of the discharges.

The ability to land and be safely secured in bad weather very greatly reduces the number of days which must be regarded as too bad for flying.



That the airship, both rigid and non-rigid, is a valuable field of investigation which will justify development, both for warlike and commercial purposes, few people who know anything of the details have any doubt. Those who know much about airships are more hopeful than those who know little. The greatest airship enthusiasts are, perhaps, those who know the achievements and the troubles of both airships and aeroplanes.

A Danish type H two-seater Biplane built by the Army Factory at Copenhagen (140 h.p. Argus engine).

MODERN BRITISH AEROPLANES.

XVII.—The Sopwith Aviation Co., Ltd.

The Sopwith Aviation Co. was formed in 1911 at Brooklands by Mr. T. O. M. Sopwith, who had qualified as a pilot in Nov., 1910, on a Howard-Wright biplane, and during 1912 a 70-h.p. tractor biplane and a 40-h.p. A.B.C.-engined biplane, on which Mr. H. S. Hawker set up a British duration record of 8 hours 23 mins., were produced. In 1913 the Sopwith "Tabloid" was brought out, and this machine was the forerunner of all the small fighting scouts of to-day. In 1914 a 100-h.p. Mono-Gnôme-engined "Tabloid" biplane, fitted with floats and flown by Mr. Howard Pixton at Monaco, won the "Schneider" Cup. During the war the firm produced a series of highly efficient aeroplanes, and it is interesting to note that two of their "Tabloid" biplanes were the first machines to bomb Cologne and Düsseldorf in Nov., 1914. Sopwith 1½-strutters were also used by the French Air Service to bomb Essen and Munich.

THE SOPWITH "TABLOID" SCOUT.

The Sopwith "Tabloid" was used during the first part of the late war principally by the R.N.A.S. for almost any odd jobs going. This machine was a slight modification of the 1913 machine by having a Vee-type undercarriage in place of the skid and wheels arrangement and a larger engine, usually the 100-h.p. Mono-Gnôme.

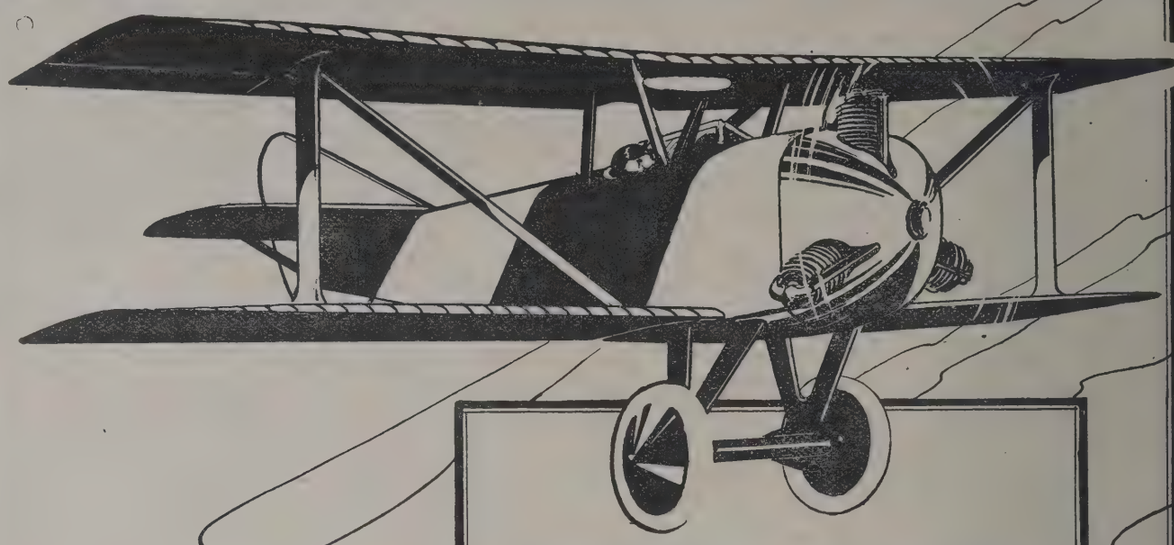
THE SOPWITH "SCHNEIDER" SEAPLANE SCOUT.

The Sopwith "Schneider" seaplane was the original type of machine which won the "Schneider" Cup at Monaco in 1914. The R.N.A.S. ordered a considerable number of these machines, and, although at times they were considerably abused by being made to carry bombs and other armament, were in use right up to the signing of the armistice. Latterly, the fitting of the 130-h.p. Clêrget engine considerably improved their performance and popularity.

SPECIFICATION.

Type of machine	Single-seater tractor seaplane.
Name or type No. of machine	Sopwith "Baby" or "Schneider."
Purpose for which intended	Sea scouting, fighting, etc.
Span	25 ft. 8 in.
Gap, maximum and minimum	4 ft. 6 in.
Overall length	22 ft. 10 in.
Chord	5 ft. 2 in.
Total surface of wings	240 sq. ft.
Total area of tail	26 sq. ft.
Area of elevators	12 sq. ft.
Area of rudder	6.5 sq. ft.
Area of fin	2.7 sq. ft.
Engine type and h.p	100-h.p. Clêrget.
Landing speed	45 m.p.h.

THE SOPWITH "GUN 'BUS."



The Sopwith gun carrying biplane was brought out in 1914 and was the only Sopwith production that departed from the more usual tractor type of machine. It was fitted with the 160-h.p. Sunbeam engine and owed its inception to the demand for large fighting machines before the introduction of the fire control gear for tractor machines. It resembled the F.E. in many respects with the exception that it had staggered main planes and a skid undercarriage

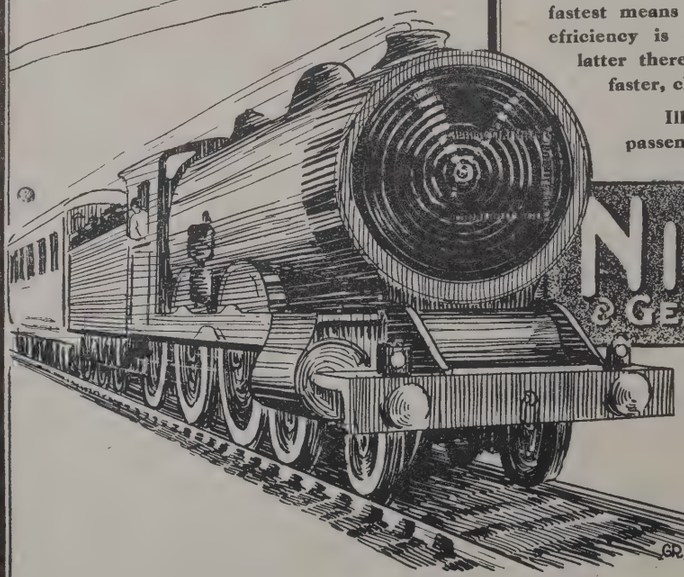
THE SOPWITH "PUP."

The Sopwith "Pup" was a direct descendant of the "Tabloid" of early 1914, and was largely used by the R.N.A.S. from 1915 onwards. During its existence it has maintained the reputation of being one of the most delightful machines to fly that have ever been built. In addition its performance, fitted with so low a powered engine as the 80-h.p. Le Rhône, was astonishing, and although its use as a land fighting scout was overshadowed by modern high-powered machines, it was used largely almost up to the end of the war as a ship's scout and for deck flying, etc.

SPECIFICATION.

Type of machine	Single-seater Tractor Biplane.
Name or type No. of machine	Sopwith "Pup."
Purpose for which intended	Fighting Scout.
Span	26 ft. 6 in.

TRANSITIONS IN TRANSIT.



No. 7. The Special Train.

With a whistle and a roar the "Special" dashes through the wayside station—and is gone. The very symbol of urgent speed. Every ounce of steel strained nigh to bursting point in frantic endeavour to extract the last grain of energy from its vitals.

And its passenger? Maybe he is an eminent surgeon, answering an urgent call to the bedside of a rich patient. Perhaps he is a statesman hurrying on an important mission. Or a business magnate on whose presence vast projects depend.

Up to a few years ago, the "Special" was the fastest means of commercial transit. Nowadays, its efficiency is outshone by the aeroplane, and the latter therefore takes its place. The aeroplane is faster, cheaper and more direct.

Illustrated above is the Nieuport 2-seater passenger plane.

BRITISH
NIEUPORT
& GENERAL AIRCRAFT CO. LTD.

CRICKLEWOOD, LONDON, N.W.2

Telephone: WILLESDEN 2455 (3 lines).

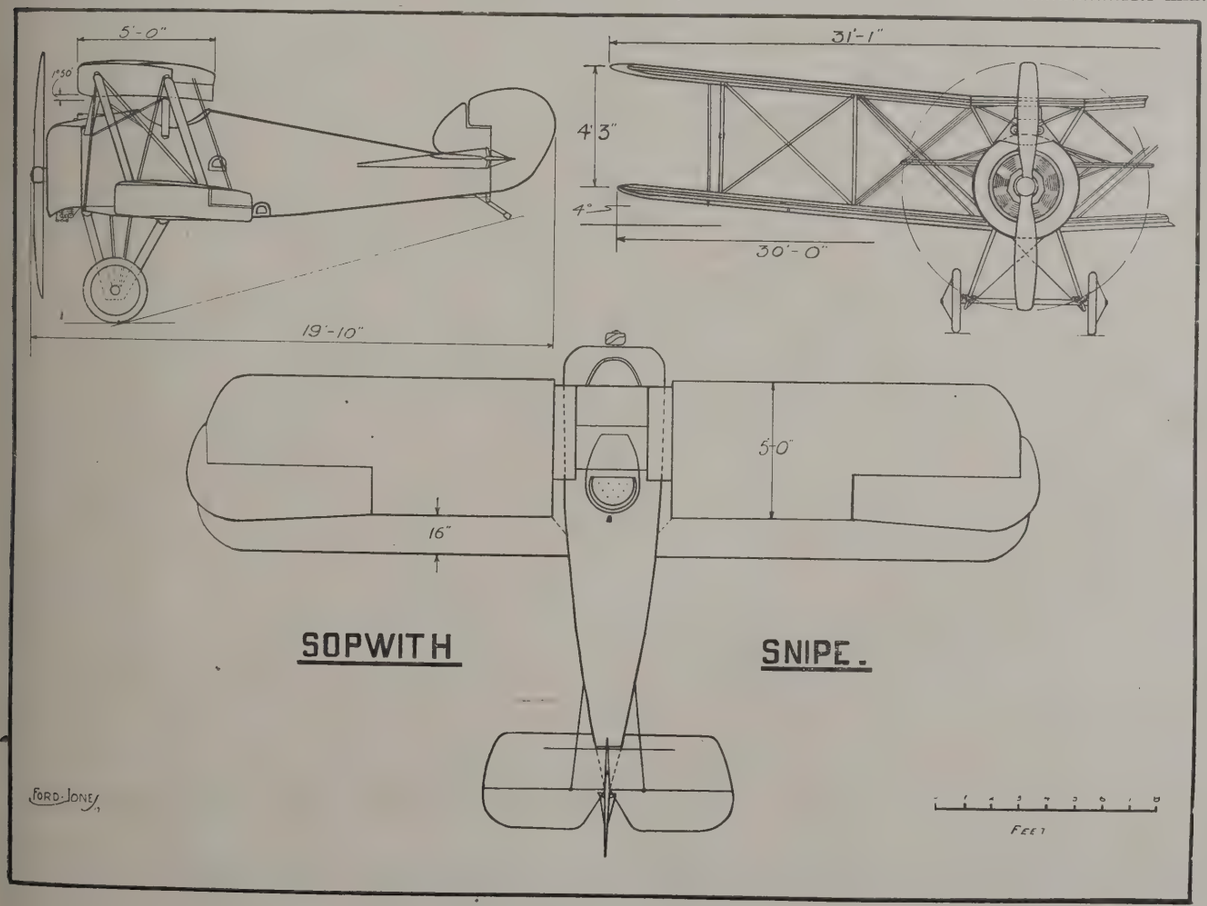
Telegrams: NIEUSCOUT, CRICKLE, LONDON.

Gap, maximum and minimum ...	4 ft. 4⅞ in.
Overall length ...	19 ft. 3¾ in.
Maximum height ...	9 ft. 5 in.
Chord ...	5 ft. 1½ in.
Engine type and h.p. ...	Le Rhône; 80 h.p.
Tank capacity in gallons ...	Petrol 18 galls.; oil 5 galls.
Performance—	
Speed at 10,000 feet ...	99 m.p.h.
Climb—	
To 5,000 feet in minutes ...	7 mins. 40 secs.
To 10,000 feet in minutes ...	15 mins. 24 secs.
Total weight of machine loaded	1,313 lbs.

THE SOPWITH "1½ STRUTTER."

The Sopwith "1½ strutter" was more or less an enlarged "Pup" and was the first British machine to be fitted with a synchronised gun, the gear being of the Sopwith-Kauper type. The pilot was also put in front and the rear or gunner's cockpit being fitted with a Scarff mounting for a Lewis gun. The "1½ strutter" was for its time an immensely efficient fighting machine and was used in large numbers by the British Air Services as well as by the French and Belgian Governments. The "1½ strutter" was also used as a single-seater bomber by having the gunner's seat removed and being fitted with a 130-h.p. Clêrget engine. The Sopwith "1½ strutter" ship-plane is still being used largely for operating from aircraft carriers and battleships.

SPECIFICATION.



Type of machine ...	Two-seater tractor biplane.
Name or type No. of machine ...	Sopwith "1½ Strutter."
Purpose for which intended ...	Two-seater fighter.
Span ...	33 ft. 6 in.
Gap, maximum and minimum ...	5 ft. 5 in.
Overall length ...	25 ft. 4 in.
Chord ...	5 ft. 6 in.
Total surface of wings ...	353 sq. ft.
Total area of tail ...	57 sq. ft.
Area of elevators ...	21.5 sq. ft.
Area of rudder ...	7.25 sq. ft.
Area of fin ...	3.5 sq. ft.
Area of ailerons ...	52 sq. ft.
Engine type and h.p. ...	130-h.p. Clêrget.
Weight of machine empty ...	1,316 lb.
Load per sq. ft. ...	6.7 lb.
Weight per h.p. ...	18.8 lb.
PERFORMANCE—	
Speed at 10,000 ft. ...	103 m.p.h.
Landing speed ...	35 m.p.h.
Climb—	
To 6,500 ft. in min. ...	12.7 min.
To 10,000 ft. in min. ...	24.6 min.
Disposable load apart from fuel ...	344 lb.
Total weight of machine loaded ...	2,342 lb.

THE SOPWITH "TRIPLANE."

The Sopwith "Triplane" produced in 1916 set a fashion of its own which was badly copied by many German firms, the most famous example being the Fokker D.VII. Designed with a view to cutting down the pilot's blind spots and possessing a remarkable performance in climb, the machine was, for its time, a very successful fighter. It was used by the R.N.A.S. in the land squadrons sent for service to France, and also by the French Naval Air Service.

SPECIFICATION.

Type of machine ...	Single-seater triplane.
Name or type No. of machine ...	Sopwith "Triplane."
Purpose for which intended ...	Fighting scout.
Span ...	26 ft. 6 in.
Gap, maximum and minimum ...	3 ft.
Overall length ...	18 ft. 10 in.
Chord ...	3 ft 3 in.
Total surface of wings ...	231 sq. ft.
Total area of tail ...	23.6 sq. ft.
Area of elevators ...	9.6 sq. ft.
Area of rudder ...	4.5 sq. ft.
Area of fin ...	2.5 sq. ft.
Area of aileions ...	34 sq. ft.
Engine type and h.p. ...	130-h.p. Clêrget.
Weight of machine empty ...	1,103 lb.
Load per sq. ft. ...	6 lb.
Weight per h.p. ...	12.4 lb.
PERFORMANCE—	
Speed at 6,500 ft. ...	112½ m.p.h.
Speed at 10,000 ft. ...	106½ m.p.h.
Speed at 15,000 ft. ...	95 m.p.h.
Landing speed ...	35 m.p.h.
Climb—	
To 6,500 ft. in min. ...	6.5 min.
To 10,000 ft. in min. ...	11.8 min.

To 15,000 ft. in min. .....22.3 min.
Disposable load apart from fuel .....80 lb.
Total weight of machine loaded .....1,543 lb.

THE SOPWITH "CAMEL."

The "Camel," perhaps the best known of British single-seater scouts, was brought out towards the end of 1916 and was more or less an improved "Pup." The installation of the 130-h.p. Clêrget and various other engines up to the 150-h.p. A.R.1, latterly known as the B.R.1, gave the machine an extraordinarily good performance. It is also interesting to note that the "Camel" was the first single-seater scout to be fitted with two synchronised machine guns.

The "Camel" was also largely used for deck flying, getting off the guns of the warships and also flying off lighters towed by fast destroyers. The edition of the "Camel" used for this purpose was known as the "Ships' Camel," and for convenience for stowage purposes the fuselage was made in two parts, the join being just in rear of the pilot's cockpit. For simplicity in joining all controls are external.

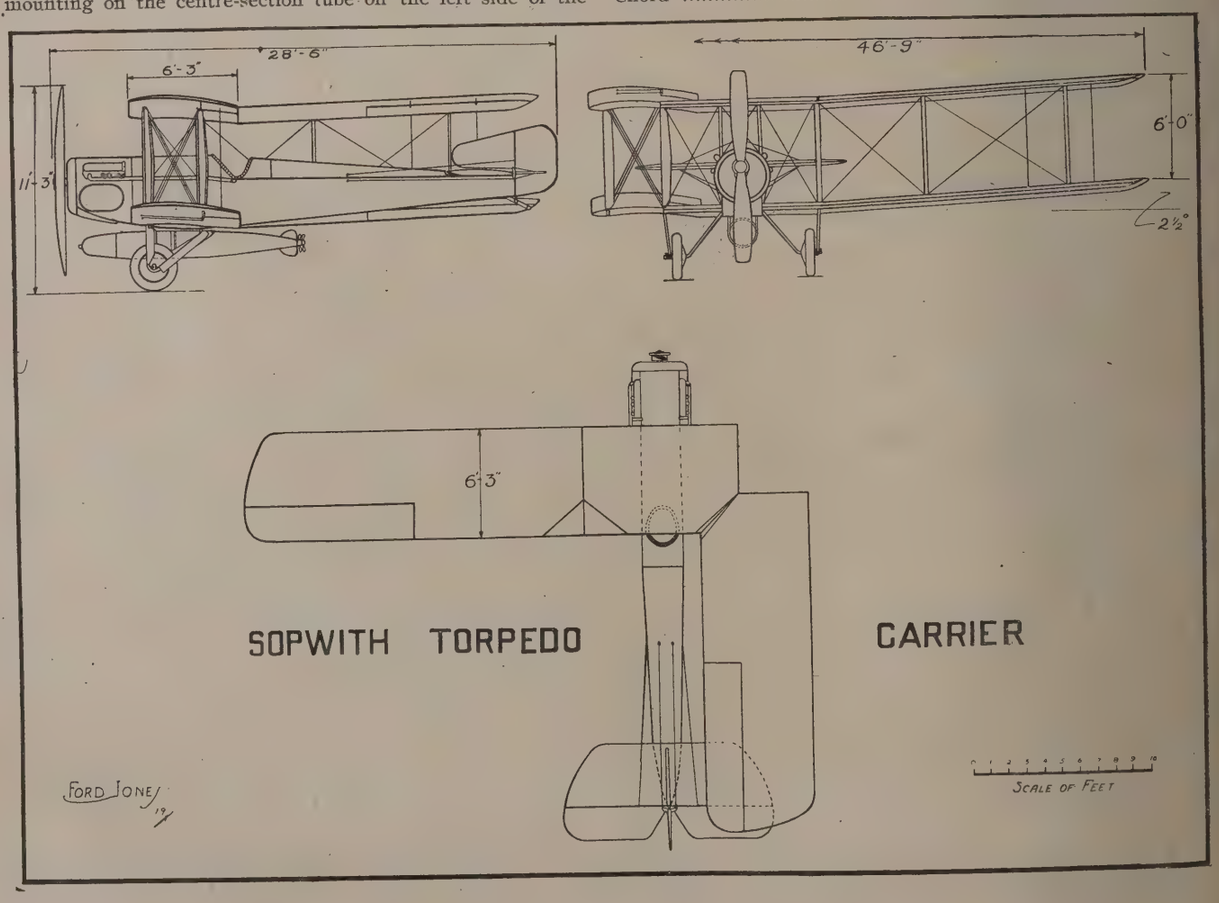
SPECIFICATION.

Type of machine	Single-seater Tractor Biplane.
Name or type No. of machine ...	"Camel"—F.1.
Purpose for which intended	Fighting Scout.
Span	28 ft.
Gap, maximum and minimum ...	5 ft. max ; 4 ft. 1 1/16 in. min
Overall length	18 ft. 9 in.
Maximum height	9 ft.
Chord	4 ft. 6 in.
Engine type and h.p.	Clerget ; 130 h.p.
Tank capacity in hours	Petrol 2½ hrs. ; oil 2½ hrs.
Tank capacity in gallons	Petrol 26 galls. ; oil 5¾ galls.
Performance—	
Speed at 10,000 feet	113 m.p.h.

THE SOPWITH "DOLPHIN."

The "Dolphin," produced towards the middle of 1917, was the first Sopwith fighting scout to be fitted with a stationary water-cooled engine, and was designed to give the pilot a large range of vision. For this purpose the pilot was brought up under the centre section, which was left open, allowing the pilot's head to protrude through the planes. A very formidable armament was designed to be fitted, but for practicable purposes it was fitted with two fixed Vickers guns firing through the airscrew and one Lewis gun on a special mounting on the centre-section tube on the left side of the pilot. Owing to the decrease in the gap and the increased span, two pairs of struts were fitted on either side of the fuselage so as to give a better angle to the interplane bracing wires. The "Dolphin" was also adopted by the French and American Governments to be fitted with the 300-h.p. Hispano-Suiza, which gave it a speed of 133 m.p.h. at 16,500 ft., to which height it climbed in 12.2 mins. Unfortunately, owing to the suspension of hostilities, this version of the machine was never used on active service.

SPECIFICATION.



Type of machine	Single-seater Tractor Biplane.
Name or type No. of machine ...	"Dolphin"—5 F.I.
Purpose for which intended	Fighting Scout.
Span	32 ft. 6 in.
Gap, maximum and minimum...	4 ft. 3 in.
Overall length	22 ft. 3 in.
Maximum height	8 ft. 6 in.
Chord	4 ft. 6 in.
Engine type and h.p.	Hispano-Suiza ; 200 h.p.
Tank capacity in hours	Petrol 2¾ hrs. ; oil 2¾ hrs.
Tank capacity in gallons	Petrol 27 galls. ; oil 4 galls.
Performance—	
Speed at 10,000 feet	121½ m.p.h.
Climb—	
To 5,000 feet in minutes	5 minutes.
To 10,000 feet in minutes	12 minutes.
Total weight of machine loaded—	1,959 lbs.

THE SOPWITH "CUCKOO."

In 1915 the Sopwith Co. brought out a torpedo-carrying aeroplane fitted with a 200 Canton-Unné engine. This machine was of a purely experimental nature and was not considered seriously until the Admiralty requested that further machines of the type be built. This resulted in the Sopwith "Cuckoo," which was fitted with a 200-h.p. Hispano-Suiza engine. The machine was a single-seater biplane having a divided undercarriage with no cross-axle, thus allowing for the stowage of an 18-inch torpedo under the centre of gravity.

SPECIFICATION.

Type of machine	Single-seater torpedo-carrying biplane.
Name or type No. of machine	Sopwith "Cuckoo."
Purpose for which intended	Torpedo-carrying, etc.
Span	46 ft. 9 in.
Gap, maximum and minimum	6 ft.
Overall length	28 ft. 6 in.
Chord	6 ft. 9 in.

To "Aeroplane" Subscribers.

HOW TO SAVE ONE GUINEA, EIGHT SHILLINGS & NINEPENCE OR SEVEN & SIXPENCE.

The subscription list of the AEROPLANE, both at home and abroad, is steadily increasing: an eminently satisfactory movement which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, M.C., A.F.C., R.A.F., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE:— namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

Subscribers who take advantage of this offer will have no reason to complain of the cost of their books.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" or one year post free **(30/- inland ; 35/- abroad** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

Total surface of wings	566 sq. ft.
Total area of tail	53.6 sq. ft.
Area of elevators	18 sq. ft.
Area of rudder	8 sq. ft.
Area of fin	5.7 sq. ft.
Area of each aileron and total area	20 sq. ft., 80 sq. ft.
Engine type and h.p.	200-h.p. Hispano-Suiza.
Weight of machine empty	1,840 lb.
Load per sq. ft.	6.4 lb.
Weight per h.p.	17 lb.

Performance—

Speed at 10,000 ft.	100 m.p.h.
Landing speed	40 m.p.h.

Climb—

To 6,500 ft. in min.	14.5 min.
To 10,000 ft. in min.	26 min.
Total weight of machine loaded	3,370 lb.

THE SOPWITH "SNIPE."

The "Snipe" was produced towards the end of 1917 and was an improvement of the "Camel." The gap was reduced and the height of the fuselage increased so as to bring the pilot well up in line with the centre section, which was left open. The fuselage is circular in section, being faired so as to preserve the form of the circular cowling over the B.R.2 engine. The machine was never fully tried on active service, but the short time it was employed in France it performed extremely well. An experimental model was fitted with the A.B.C. "Dragonfly" engine by the authorities and attained a speed of 156 m.p.h. and climbed 10,000 feet in 4½ minutes.

Specification.

Type of Machine	Single-seater Tractor Biplane.
Name or type No. of machine	"Snipe"—7 F.I.
Purpose for which intended	Fighting Scout.
Span	Top plane 31 ft. 1 in. bottom plane 30 ft.
Gap, maximum and minimum	4 ft. 3 in.
Overall length	19 ft.
Maximum height	9 ft. 6 in.
Chord	5 ft.
Engine type and h.p.	B.R. ; 200 h.p.
Tank capacity in hours	Petrol 3 hrs. ; oil 3 hrs.
Tank capacity in gallons	Petrol 38½ galls. ; oil 7 galls.

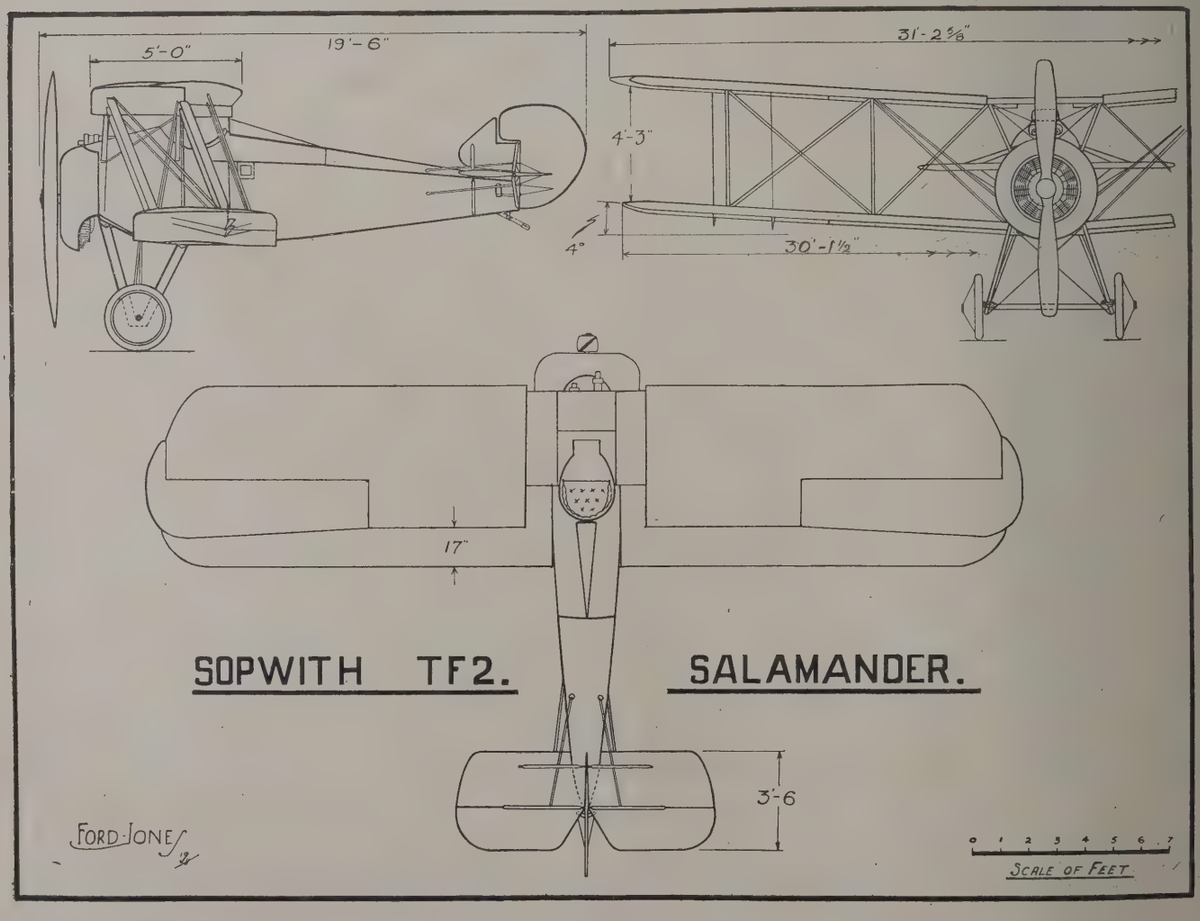
Performance—

Speed at 10,000 feet	121 m.p.h.

Climb—

To 6,000 feet in minutes	3 mins. 45 secs.
To 10,000 feet in minutes	9 mins. 25 secs.
Total weight of machine loaded	2,020 lbs.

THE SOPWITH "SALAMANDER."



The Sopwith "Salamander" is a development of the "Snipe," the principal difference being that the "Salamander" was designed primarily for the more advanced form of warfare known as "trench-strafing," and as such is fairly heavily armoured. The armour plating is incorporated in the construction and extends from the rear of the engine cowling to the rear of the pilot's seat and weighs roughly about 650 lb. Two fixed guns are carried in the cowling in front of the pilot's seat. A bullet-proof streamline hump in rear of the pilot's head affords extra protection to the pilot.

Specification.

Type of machine	Single-seater biplane.
Name or type No. of machine	Sopwith "Salamander."
Purpose for which intended	Trench fighting, etc.
Span	top 31 ft. 2⅝ in., bottom 30 ft. 1½ in.
Gap, maximum and minimum	4 ft. 3 in.
Overall length	19 ft. 6 in.
Chord	5 ft.
Total surface of wings	272 sq. ft.
Total area of tail	26 sq. ft.
Area of elevators	11 sq. ft.
Area of rudder	9 sq. ft.
Area of fin	2.75 sq. ft.
Area of each aileron and total area	12.75 sq. ft., 51 sq. ft.
Engine type and h.p.	230-h.p. B.R.2.
Weight of machine empty	1,844 lb.
Load per sq. ft.	9.4 lb.
Weight per h.p.	11 lb.

Performance—

Speed at 6,500 ft.	123 m.p.h.

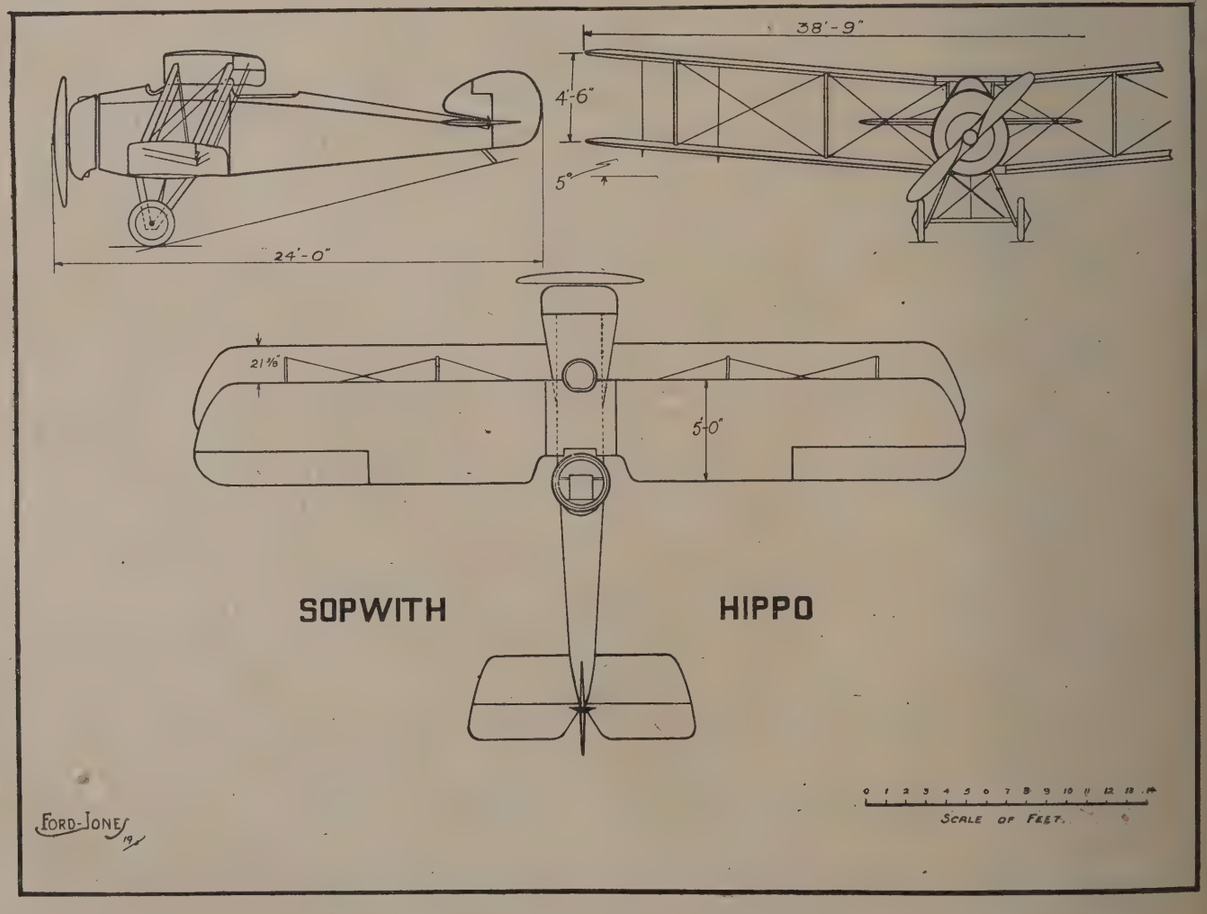
"CLERGET" PATENT AERO ENGINES

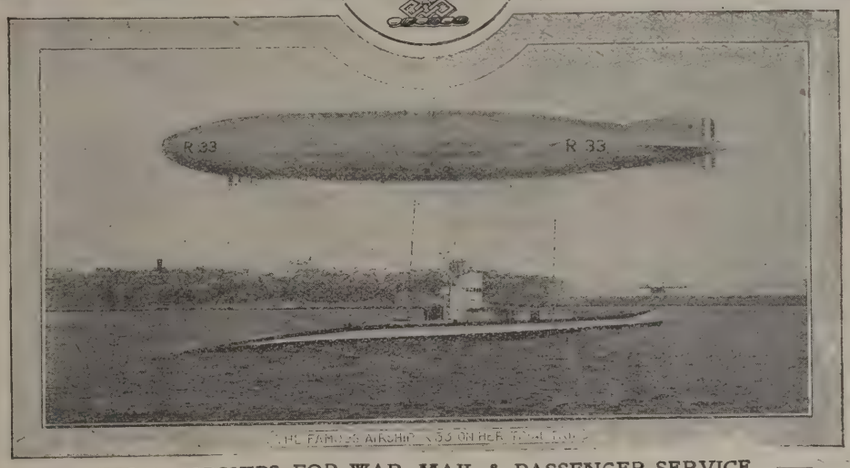
ENGINEERS, LONDON.

"GWYNNE, LONDON." "HAMMERSMITH, 1910."



A Seaplane of the Sopwith "Baby" type with 130 h.p. Clerget engine. The machine illustrated was built by the Blackburn Aeroplane and Motor Co., Ltd.

Speed at 10,000 ft.	117 m.p.h.
Landing speed	60 m.p.h.
Climb—	
To 10,000 ft. in min.	17.1 min.
Disposable load apart from fuel	410 lb.
Total weight of machine loaded	2,510 lb.



THE SOPWITH "HIPPO."

This was an experimental two-seater fighter, in which the pilot was placed directly in rear of the large 230 R.R.2 or Clêrget engine, in advance of the upper plane, which had a very large backward stagger and was placed directly on top of the fuselage. The gunner's cockpit was in rear of the upper plane. It will thus be seen that both pilot and gunner possessed a very good vision all round.

Many other experimental specimens of the Sopwith menagerie were produced during the war, about which very little is known. Mention might be made of the "Rhino," a two-seater triplane fighter fitted with a 230-B.H.P. "Puma," the "Bulldog," and the "Buffalo," both two-seater fighters fitted with the 230-h.p. B.R.2, etc.

The "Bristol" Aeroplanes

AIRCRAFT in the WHALING and FISHING INDUSTRIES.

Aircraft can form an invaluable adjunct to a whaling or fishing fleet. Already the whalers of the Northern Pacific have made arrangements for co-operation with aircraft, for upon efficient observation depends the whole success of a whaling expedition. Similarly in general fisheries aircraft can render enormous aid in the location and timely warning to the fleets of approaching shoals

The well-known stability and the strong and durable construction of "BRISTOL" Aircraft render them eminently suited for this purpose.

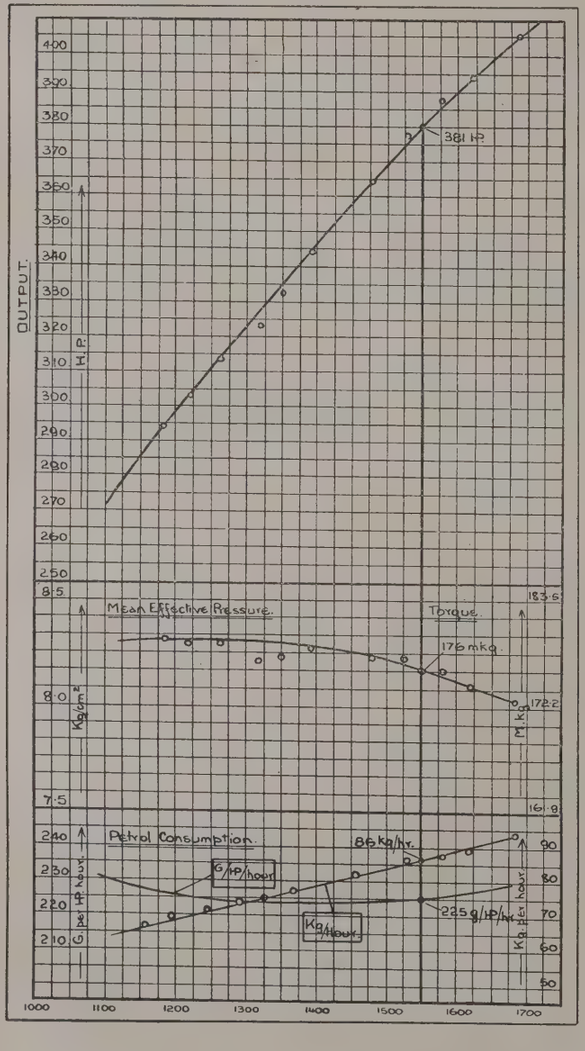
KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

A GERMAN VIEW OF THE LIBERTY ENGINE.

A report by Herr Otto Schwager, published in the German paper, "Der Motor-wagen," gives a very complete account of the 12-cylinder Liberty aero-engine, based on a sample captured in a DeH.9a.

This type of engine has been described in THE AEROPLANE and the description need not be repeated, but the German comments upon the design and performance of this specimen are interesting.



The design of the crankcase and the low weight thereof are favourably commented on, and the working pressures on the crankshaft bearings are considered to be comparatively low.

The driving of the propeller boss through a conical seating on the crankshaft end, instead if making the inner flange of the boss integral with the shaft, is considered unsuitable in an engine of such high power, but is explained by the presence of the double-thrust races which make the engine suitable for either a tractor or propeller airscrew, which it would not be possible to assemble with the solid flange.

The strength and rigidity of the connecting rods are specially noted, and the arrangement of the twin big ends, the straight-through rod running directly on the bronze bush of the forked one is given as evidence that the engine is unsuitable for running at high speeds and that it has not been intended for use in conjunction with a reduction gear. The working pressures on the big end bearings are considered to be very moderate. The loading of the little end bearings are, on the contrary, considered to be very high.

The piston design is favourably viewed—as providing ample strength and a good heat transmission from the piston head to the cylinder walls. The conical cylinder head, allowing for large valve areas, is apparently approved.

The resemblance of the overhead valve gear to that of the Mercédès naturally does not pass unnoticed.

German Test Curves of the Liberty Engine.

The arrangement of the carburetters within the V of the cylinders is considered crude—though it is admitted that the V-type presents serious difficulties in this respect.

The induction pipe system is praised—particularly in regard to the mean gas velocity therein at normal full speed.

The Delco ignition system is described in detail and is very highly commended, both on account of the saving in weight as compared with the normal magneto system, and on account of the superior reliability of the system—since even if the generator is damaged the batteries will still supply current for some hours' flying. It is also pointed out that with this ignition system it would be possible to use a single source of supply for current for ignition, lighting, wireless and heating and thus considerably simplify the electrical installation.

Comparing the weights of the Liberty ignition gear with that of the 375-h.p. Rolls-Royce, Herr Schwager gives the following table :—

ROLLS-ROYCE.		LIBERTY.	
4 Magnetos, each 6.8kg.	27.20kg.	1 Dynamo with driving connections	5.5kg.
8 Magneto brackets	4.31kg.	1 Battery	6.0kg.
1 Rear driving shaft	2.92kg.	1 Switch and field regulator	0.99kg.
1 Front driving shaft	1.34kg.	2 Contact breakers and distributors	4.87kg.
1 Intermediate shaft	0.82kg.	Insulating tube and wiring	4.12kg.
4 Spring clutches	0.78kg.	24 Plugs	2.8kg.
1 Starting magneto	2.91kg.		
1 Insulating tube and wiring	4.96kg.		
24 Plugs	2.64kg.		
Totals	47.88kg.		27.28kg.

The capacity of the circulating pump is considered to be too small, giving a low circulation velocity and therefore needing a radiator of about twice the size that would be called for in German practice.

A curve of horse-power against revolutions obtained by test is given, and the excellent form of the curve is admitted and ascribed to the carefully proportioned valve areas and to the moderate gas velocity in the inlet system. It is stated that although only 381 h.p. at 1,550 r.p.m.—instead of the nominal 400 h.p.—was obtained, yet that the legend h.p. could probably be reached at that speed were the carburation adjusted for maximum power instead of, as it actually was, for the best fuel consumption.

The weight of the engine, given as 396 kilos, with water, but without airscrew hub or exhaust manifold, is considered to be very good indeed.

Altogether the motor is summed up as a remarkable new product, fitted with an excellent and novel ignition system, giving a very low weight per h.p., and fair petrol economy, and it is noted that this result has been attained by the use of component parts of proved design throughout.

Herr Schwager considers, however, that the engine would be considerably improved if the design of the pistons and connecting rods were improved and lightened to fit the engine for a higher speed of revolution and it were then fitted with a reduction gear.

The engine described by Herr Schwager was Liberty motor No. 709, installed in a British DeH.9a "Hyderabad No. 3" built by the Westland Aircraft Works, Yeovil.

A PETROL POURER.

Brown Brothers, Ltd., are advertising a novelty for sale. It is the "Yapp" Petrol Pourer and the illustration shows how it is fitted into a petrol can. The air inlet pipe must be fitted so that its external end faces the opposite corner of the can across the handle.

The forefinger must be kept on the air inlet pipe until the can is raised into an inverted position ready for pouring. If it is desired to stop pouring before the can is empty, it is only necessary to replace the finger.

The "Yapp" takes only thirty to thirty-five seconds to empty a two-gallon petrol tin. The petrol is filtered by a gauze in the "Yapp," which takes up considerably less room than a funnel and is far more convenient to use. The price is 5s. 6d.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

STANDARD SPEECHES.

NO. 2.—THE PRESIDENT OF THE BORED WITH TRADE.

By "MEDWAY."

A week or so back I ventured to suggest the standardising of speeches for Government officials, and gave an example of the kind of thing I recommended for an Under-Secretary desirous of handing out a little soft soap without really involving himself in anything in particular. It occurs to me that the idea might be extended to serve for other occasions of a different kind.

Lately I have been watching closely the receptions accorded to various industries when they appealed to the Government for some kind of safeguards against foreign competition. In point of fact, the Minister responsible for meeting these people and subjecting them to elementary instruction and mild ridicule, which is considered the proper treatment for their complaints, has already standardised his remarks almost completely. I can, therefore, do nothing more than take him a step farther in this direction.

I recently inflicted upon my readers a few suggestions as to how it seemed to me the Government might help to establish Commercial Aeronautics. I now imagine a deputation from the Aircraft Industry waiting upon the "President of the Bored with Trade" to advocate these or other proposals. As a preliminary, the Industry holds several serious meetings and prepares a complete memorandum which is revised and revised again until it is believed to be as near as possible perfect.

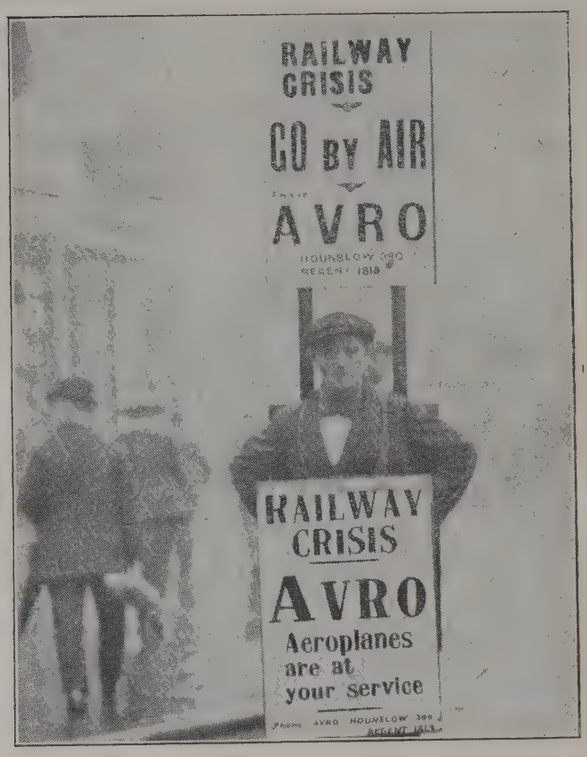
An appointment is made for the reception of the deputation. The Minister does not ask for a statement of its case to be submitted in advance so that it may be analysed and, if necessary, elucidated in correspondence. He is quite content to have the whole thing pitched at his head at top speed in an open meeting, and his power of assimilation is such that, as soon as the reading of the statement is completed, he is immediately in a position to reply to it definitely and in scathing terms. To the accompaniment of the pencils of many reporters, he sets about his unfortunate visitors as follows:—

"Gentlemen, I am more than delighted to see you here to-day, because it affords me yet another opportunity of making exactly the same remarks as I have made on several occasions during the past month. You are aware from my own statements that I possess absolutely complete knowledge of all the circumstances surrounding every industry established in this country. Before you arrived I still had an uncomfortable feeling that yours might prove to be the one and only exception. It was just possible that some member of your industry might have some idea which had not already occurred to me and been rejected as impracticable. It was most unlikely, but as I say it was just possible.

"Consequently I am glad to be in the pleasant position of being able to say to you, after hearing, at any rate, a portion of your statement, to which I confess I did not listen very closely, that you have added nothing to my store of knowledge. This happy fact enables me to squirt off at you my standard speech which has already been presented with much success before a number of most distinguished audiences.

"The Government, as you are aware, is in rather a funny position—funny, that is to say, for anyone but the Government. The function of a Government is to govern. Should it fail to remain in power, it cannot govern. Its function is, therefore, to remain in power. This can best be done by retaining the voting support of members of the House of Commons. Your proposals must, therefore, be considered solely from this point of view. This is where our standardised policy comes in. Were we to offer you exceptional treatment, other people might expect something similar. If we turn you down unmercifully, others will refrain from following in your footsteps. We shall then be able to point to the fact that the great majority of industries have made no representations to us, from which it can be fairly inferred that they are absolutely satisfied with us.

"After this perfunctory explanation of motives I will now put across you our world-famed proof that the less your money is worth the better are you off. The value of a sovereign has gone down. You may, therefore, be jubilant and contented. If we remain in power, we will see that it goes down further. One of these days we hope to arrive at that ideal position at which our currency is worth nothing at all. When this happens, nobody will try to import goods into this country. You will have the place all to yourselves. You, on the other hand, will be manufacturing aeroplanes and airships at no cost at all, since the money you will have paid for labour and material was absolutely worthless. You will therefore be able to place them upon the foreign markets at the cost of about twopence a dozen. The world will be at your feet, and your industry will flourish like a green bay-tree. This, you will observe, will be all our doing.



"In these circumstances it would be perfectly absurd to do anything else to help you. You may, if you like, leave with me the statement that you have so kindly prepared. One of these days I will get my secretary to read it to me, unless he has lost it in the interval. In that case I shall ask him to read me 'The Book of Revelations' or 'A Midsummer Night's Dream,' either of which will have an exactly identical effect upon my point of view and upon the desire of the Government to help your admirable industry.

"I see from your expressions that none of you have any further questions to ask, and that you are all now completely satisfied that the Government would be a born fool to do anything whatever to assist you. I shall therefore be obliged if you will consider this meeting closed, and will be most careful to mind the step when leaving!"

This little effort may strike my readers as rather far-fetched. I can assure them that, if they have occasion to go forward with any concrete proposals designed to assist the establishment of commercial aeronautics and are directed to the department I have indicated, it will be found that the reception they get will be almost identically that which I have endeavoured to indicate to them in advance.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

[*Daily Mail Photograph.*

CATCHING THE TIDE.—How the Avro Company seized the opportunity of demonstrating the possibilities of Civil Aerial Transport.

THE STRIKE AIR SERVICES.

In Germany, after the end of the war, travel by train was almost impossible. The rolling stock had all got into a very bad state through the rough and hard usage it had had during the war. Many locomotives and trucks had to be delivered to the Allies, according to the terms of the Armistice.

In consequence, aerial transport in Germany began well, and services were started to the largest towns all over the country. The prices charged for flights were high. Strikes and lack of petrol lately caused many of the services to be taken off

In England there were no such conditions to give a fillip to commercial aviation. Flying slowly developed from occasional pleasure flights to cross-Channel services. All the big aviation companies had organised their flying, and those who owned small passenger-carrying machines were looking forward sadly to a cold and unprofitable winter, when suddenly along came the railway strike, and now commercial flying is proceeding with feverish activity. There is more civil flying activity in this country now than there ever was before.

The Post Office announced on Sept. 29th :—

"The Post Office is being supplied with as many aeroplanes of the Royal Air Force as it requires, and a certain number are being placed at the disposal of newspapers, the Government realising the importance of the regular distribution of news.

"A Royal Air Force aeroplane left Kenley at 5.40 a.m. on Sept. 29th with the King's mail, landed at Newcastle-on-Tyne, and returned with other mails to Kenley by 1.40 p.m.

"The Postmaster-General has given notice that by arrangement with the Air Ministry, services by aeroplane for the conveyance of letters only will be set up on and from Sept. 30th, between London and the under-mentioned towns :—Birmingham, Bristol, Newcastle, Manchester and Glasgow.

"Letters intended for conveyance by these services should be prepaid at the ordinary inland rate of postage, and, in addition, a special fee of 2s. per oz. for each letter should be prepaid in stamps at the time of posting. Such letters should be handed in over the counter at the offices shown below not later than the times stated. They will be sent out by the next ordinary delivery after arrival at the post-office of destination.

"**Time of Posting.**—General Post Office (King Edward Building), not later than 9 p.m.; Western Central District Office (High Holborn), not later than 8 p.m., Western District Office (Wimpole Street), not later than 8 p.m.

"The present service is experimental, and the arrangements will be subject to modification in the light of experience. If the service is found to meet public needs, it is hoped to extend it to other towns."

A scheme for the conveyance of urgent dispatches by aeroplane, supplemented by dispatch riders, is in operation. The scheme was worked out before the strike by the Air Ministry and the Home Office primarily for the purpose of maintaining communications with the Police Force Commissioners and other Government officials in the provinces in the event of interruption of the regular mail services.

Advantage was first taken of the scheme on Sunday for the conveyance of important dispatches to the North of England and Scotland, and other dispatches were conveyed yesterday to a number of centres throughout England, Wales, and Scotland. Dispatches for the Home Counties of the South-East of England are distributed by aeroplanes working from London. Those for the rest of the country are conveyed from London to four centres in the North Midlands and the West of England, from which they are distributed by other aircraft, or, in a few cases, by road.

At a conference on Sunday, Sept. 28th, between the Air Ministry and the Newspaper Proprietors' Association, facilities were offered by the Air Ministry for aeroplanes to carry newspapers to the provinces. This was considered unnecessary by the newspaper proprietors, but it was arranged that a machine should leave Hounslow daily at midday for Manchester, carrying urgent copy and other material needed to maintain the newspaper services of the provinces. This machine will return at once from Manchester with a similar cargo for London.

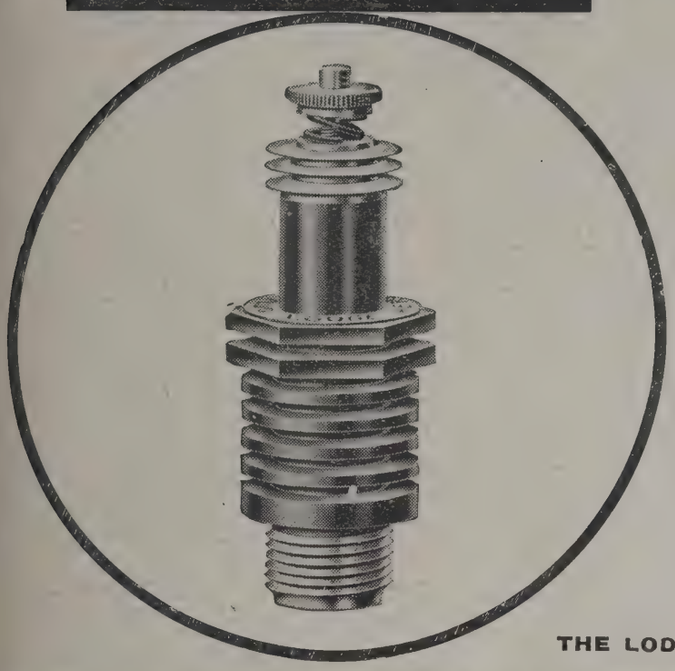
THE AVRO SERVICES.

The whole of the energies of A. V. Roe and Co., Ltd., are directed to their strike flying. They are so busy looking flights and sending machines all over the country that the following is the only "official" news received :—

The sudden railway strike has produced a call from many quarters for the services of the Avros. As soon as the crisis became serious, A. V. Roe and Co., Ltd., offered to place the services of all their machines at the disposal of the Government. Pending a demand for special official services, the machines throughout the country have been very busy conveying newspapers, printing matrices, films, etc., to various towns. Special journeys of this nature have been made from Hounslow to Manchester, Bristol, Birmingham, Norwich, Cardiff, etc. Films are being carried for the London Press Cinema to Worthing, Shoreham, Brighton, Eastbourne, St. Leonards and Hastings.

On Saturday, Sept. 27th, four Avro machines left Hounslow at 6.30 a.m. for Bristol, Cardiff, Norwich, and Birmingham. They returned at 9.55, 10.30, 11.5, and 12 noon, and then left again for Rugby, Brighton, Eastbourne, and Hull. Other machines left for Worcestershire, Somerset, and other parts of the country.

According to the "Daily Mail" of Sept. 29th, three Avro machines on Sept. 27th brought people to London from Brighton, Margate, and Weston-Super-Mare, and four other machines carried passengers to Eastbourne, Rugby, Birmingham, and Newbury.



According to the "Daily News" of like date, the Avro Company are running a daily service to London from Bristol, Cardiff, and Norwich at 8.45 a.m., and from Birmingham at 9.30 a.m. These machines deliver the newspapers from London to the various towns early in the morning. A machine will leave Hounslow daily at 2 p.m. for Manchester, returning at dawn the next day.

PUBLIC CONFIDENCE.

The strike has demonstrated the results of the missionary work which A. V. Roe and Co., Ltd., have been doing throughout the summer in popularising flying in so many parts of Great Britain. People stroll in or ring up and ask for an Avro with the same easy confidence with which they would call a land taxi. In consequence the Transport Department has been snowed under with demands, and has been quite unable to meet all the calls made upon it.

What the public does not seem to realise is that the company must charge for the full journey made by the machine. If a traveller would arrange with one friend or three friends to travel together, the expense would be halved or quartered. It would be a good thing for inquirers to ask at the ticket agencies if they know of anyone else who is desirous of travelling in the same direction. In the same way inquiries might be made at the town of destination as to the chances of getting the seats booked for the return journey.

INCREASED SERVICES.

The Postmaster-General's hand being forced by the strike, the mails were carried to Paris in two Airco machines on Monday, Sept. 29th. Aircraft Transport and Travel, Ltd., are throwing the whole of their organisation into the task of amplifying the London-Paris service. The services both ways are doubled, or even trebled. On Monday, besides the two mail-carrying machines, a D.H.16 carried four passengers and goods to Paris.

On Sept. 29th a Handley-Page machine carried the Belgian and Dutch mails. This was the first time that British mails were carried by air to those countries. Forty-five bags of mails, weighing 1,500 lbs., arrived at Hounslow at 1.10 p.m. At 1.30 p.m. they were loaded in the aeroplane, which then set off for Brussels.

On account of the strike, the Handley Page services to Paris and Brussels have been doubled, i.e., a machine will leave for both capitals every day instead of on alternate days. On Sunday, Sept. 28th, a Handley Page left Cricklewood at 8 a.m. and, after calling at Liverpool, reached Manchester at 12 noon. The machine returned to Cricklewood the next morning.

On Sept. 30th the British Aerial Transport Co. inaugurated a service between London and Birmingham. A machine leaves Hendon at 9 a.m. and 2 p.m., returning from Birmingham at 11.30 a.m. and 4 p.m.

On Sept. 29th, Major C. Draper, piloting a B.A.T. saloon-passenger machine, left Hendon at 11.20 a.m. and landed his passengers at Castle Bromwich Aerodrome, Birmingham, at 12.20. The return journey was started at 3.5 p.m., and the machine arrived at Hendon at 4 p.m.

The Supermarine Aviation Co., Ltd., of Southampton, established a flying-boat service during the week-end from Southampton to Havre. Each boat will carry two passengers and luggage.

The Blackburn Aeroplane Company were to start a regular air service between London and Leeds on Sept. 30th. An aeroplane will leave Hounslow at 12 noon for Leeds, and will carry eight passengers and 400 lb. private mails or merchandise. The fare is 15 gns. single or £30 return. A machine will leave Leeds for London at 10 a.m.

The Central Aircraft Company, at Northolt, and the Grahame-White Aviation Company, also have risen to the emergency and have a number of machines available. The latter company took passengers to Manchester on Sept. 28th, and seats were booked for Calais on Sept. 29th.

It was hoped that a Farman "Goliath" would be ready for the Paris-London service on Sept. 30th. It is reported that the British Government has made a contract with the Compagnie Générale Transaérienne for the transport of all mails for Paris, the charge for these letters being moderate and about equal to the telegraph rate.

A NEW ENTERPRISE

Perhaps the Airco London-Paris services have already made business firms realise how dependable an air line can be. One shipping firm may have thought about starting an air service of their own before the London-Paris lines began, but they certainly sent goods over by the Airco service and found the quick delivery most beneficial to their business.

As mentioned in the issue of THE AEROPLANE dated Sept. 17th, that enterprising firm of steamship owners, shipbrokers, etc., S. Instone and Co., Ltd., have obtained an aeroplane. They bought the machine from the Air Ministry. It is a D.H.4 two-seater biplane, fitted with a 350-h.p. Rolls-Royce "Eagle VIII" engine.

Mr. A. Instone stated that the Air Ministry gave them every assistance in purchasing the machine, and are also arranging for a supply of spare parts.

Lieut. F. L. Barnard (late R.A.F.), the pilot they have engaged, made a great number of cross-Channel flights whilst serving in the Communication Squadron, R.A.F. Besides acting as pilot and carrying the goods and papers of the firm, Mr. Barnard will transact the business of the company on arrival in Paris, and maybe in Italy, when civil flying to that country is allowed, and the firm decide to send freight by air to their agents there.

An aeroplane service is particularly useful to a big shipping company. Contracts have to be made quickly, and goods and papers often have to be rushed to the ship at the last minute. In America, also, there has been a good deal of talk of saving a ship's time by letting it leave the port without the Customs manifest on board and dropping this on board when the ship has got some way out to sea.

It will be remembered that on Sept. 6th Lieut.-Col. W. D. Beatty and Lieut.-Col. W. O. Raikes, of the Air Ministry, set out for Rome on a Bristol "Fighter" and all went well until they got to within twenty-five miles of Rome when they landed and the machine was destroyed by a bush fire. They went to Italy to arrange for civil flying to that country. The people who wished to fly to that country were S. Instone and Co., Ltd.

They appear to be the first British firm, apart from aircraft concerns, to use an aeroplane for business purposes. At all events, they will own the first machine in the history of aviation to carry the house flag of a firm. One hopes that such enterprise will be copied by other firms, not only shipping concerns, but all whose business makes it necessary for them to have dealings with the continent.

THE LONDON-PARIS AND BRUSSELS AIR SERVICES.

The Air Ministry made the following announcement on Sept. 27th:—

"Wireless communication has now been established between the civilian aerodromes at Hounslow (London) and Le Bourget (Paris). Messages can be transmitted between 6.45 a.m. and 7 p.m. Greenwich time. Wireless communication on this route is only available for "Air Service Messages" (viz., messages regarding arrival and departure of aircraft, weather reports, and urgent messages asking for assistance, etc.). Messages of a private or personal nature will not be transmitted.

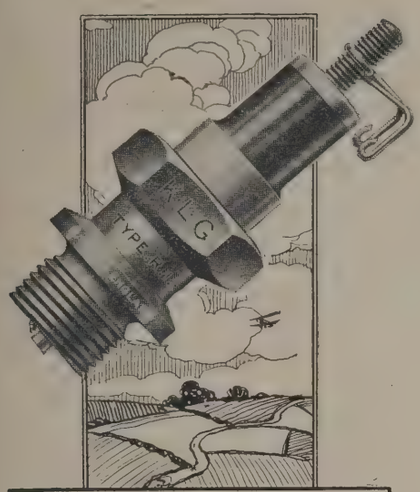
"Information as to the handing in and delivery of messages, etc., can be obtained from the Civil Aviation Traffic Officer at the Aerodrome."

The aerial service to Paris maintained by Aircraft Transport and Travel, Ltd., has now been running for five weeks, and sixty-nine trips between the two capitals have been made.

The service was maintained last week although the weather was consistently bad and extremely unfavourable for flying.

In the table of flights made, those to Brussels by Handley Page, Ltd., have been included this week. Owing to the railway strikes, it was impossible to obtain fuller details of the Handley Page flights. Details of the flights of the Bréguet machines on the London-Paris service were also unobtainable.

By arrangement with Handley Page, Ltd., Harrods, Ltd., are having the latest fashions in dresses brought over from Paris.



Diners at the Trocadero may book flights at the table. A neat card on each table gives particulars of the times of the services and the charges for them.

K·L·G

THE MOST DEPENDABLE PLUG IN THE WORLD.

For every Plug purpose the K.L.G. Standard Model R.1 has no equal. It is a one-piece Plug throughout and possesses all the advantages of detachable Plugs without any of their disadvantages. This model has been adopted as standard by many leading Motor Car Manufacturers.

Price 5/- each.

THE K.L.G. PLUG CLEANER.

This cleaner consists of a triple pronged scraper made in one piece from steel. By simply inserting this right into the Plug and giving it several turns backwards and forwards it removes the carbon from the whole surface of the mica insulation, and, of course, cleans it away from the end of the Plug as well. The use of this simple cleaning device maintains the "K.L.G." Plugs in good condition always. Price 6d. each.

Lavington Brothers, 68, Old Bailey, E.C.

LONDON.

HOUNSLOW.—At dawn every morning four Avros leave Hounslow for Cardiff, Birmingham, or wherever they are wanted to go, carrying newspapers, etc. They return home by midday, and after lunch machines often leave for Manchester. One of the machines returned from Manchester to London in two hours, at a speed of 100 miles per hour, which shows that, while the comparatively low-powered engines used are economical to run, the Avros can on occasions show a very respectable turn of speed. Sir William Crossley is among those who have chartered an Avro for a journey from Manchester to London.

Lieutenant-Colonel G. L. P. Henderson (late R.A.F.), flying his own Armstrong, Whitworth biplane, with a 160-h.p. Beardmore engine, and carrying Major Lloyd as passenger, has completed a business flight to Nice and back. They started from Hounslow and arrived at Nice on Sept. 20th.

They left Nice on the evening of Sept. 23rd and came through to London with two stops. The first landing had to be made in the Maritime Alps. The second was at Le Bourget, Paris, where it took between three and four hours to fill up the petrol tanks. Hounslow was reached at 7.45 p.m. on Sept. 25th.

It should be possible to make the journey to Nice within twenty-four hours but for the bad arrangements at the landing grounds on the route. The journey proved the reliability of the aeroplane for that sort of journey. Col. Henderson stated that it was not necessary to undo the engine covering during the ten days that he was absent from London.

Major Stuart-Wortley (late R.A.F.), flying an Airco D.H.4a, left Hounslow at 1.10 p.m. on Sept. 24th for Interlaken (Switzerland). He will give a series of demonstration flights there.

BROOKLANDS.

The aircraft firms in the Weybridge district are jealously guarding their secrets as regards the construction of new types of aeroplanes.

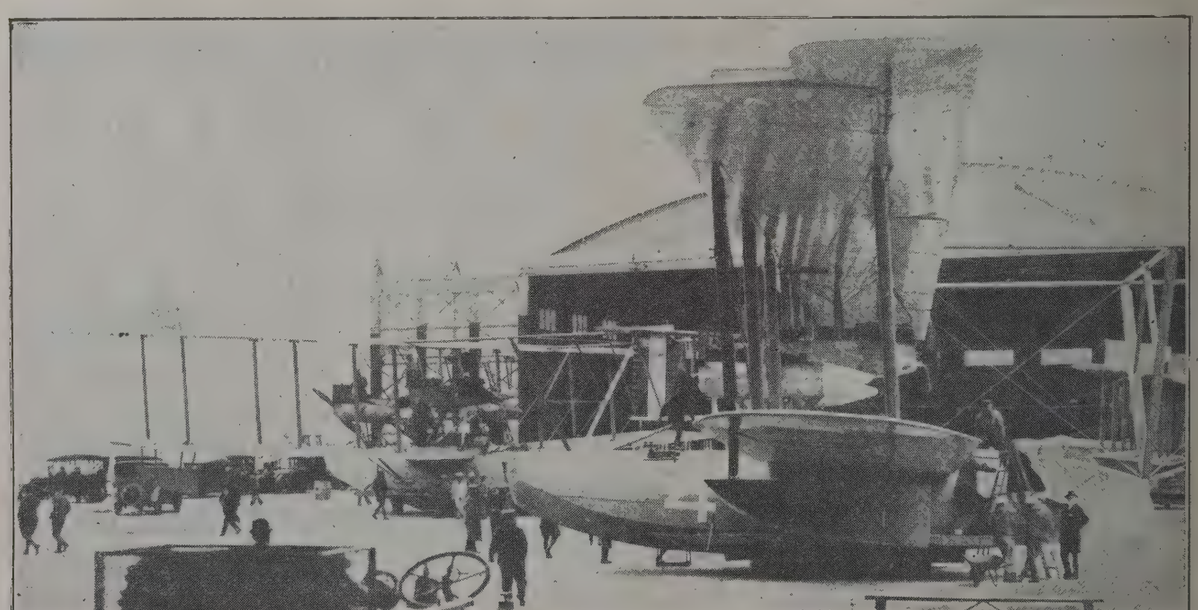
The Air Navigation Company (Blériot's) of Addlestone are at present turning out light cars, and little information is to hand concerning their programme as regards aircraft.

Vickers, Ltd., of Weybridge, are finishing a contract for "Vimy" bombers, after which it is expected they will construct "Vimy" Commercial machines.

The Lang Propeller Company are now building boats of all descriptions in addition to their famous airscrews.

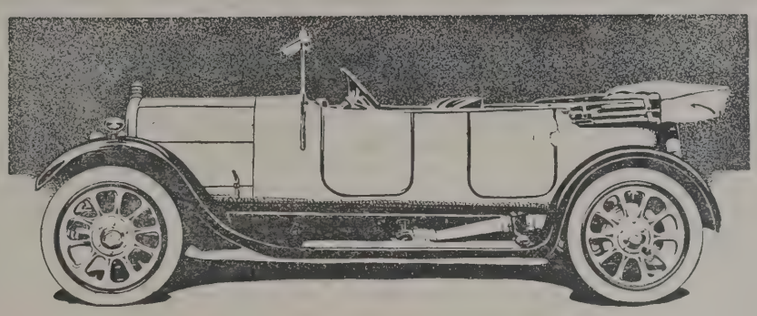
Pilots have been particularly active at Brooklands during the past week (ending September 13th). Machines in the air at different times were a "Vimy" bomber, the Martinsyde Australian machine (which has a pleasing appearance in the air, and is painted all over grey), sundry Sopwith "Snipes," "Doves," and "Gnus," a Bristol fighter and one of the "famous" S.E.5s

Machines also passed over from other aerodromes, and an O/400 Handley Page proved a striking contrast to a Martinsyde F.4 which gambolled above the huge and steady-going "twin."



According to local papers the track at Brooklands is to be repaired shortly, and made ready for the next season's motor racing, and the R.A.F. having by then, one hopes, departed, Brooklands will doubtless return to its pre-war position as one of the homes of aviation and motoring.—J. F. S.

DONCASTER.



That the Doncaster aerodrome is to be relinquished by the R.A.F. and will not be retained as a civil landing station is bad news for the town. It was expected that the flying ground would be an important feature in the development of the district.

NOTTINGHAM.

Lieut. Macrae, M.C. (late R.A.F.), and his travelling circus of Avros have been at Nottingham during the past week, but previous to the outbreak of the strike the weather was not very favourable for flying. When the strike came fine weather returned, and the Avros got busy. One journey was made to Grantham and Lincoln. The local representative of Messrs. Boots and a supply of drugs were carried. The latter were delivered at shops in both Grantham and Lincoln within an hour of the start.

A side view of the N.C.4, which flew from the U.S.A. to Plymouth via the Azores in June. The photograph gives an excellent idea of the size of the craft. A few such boats would be useful for passenger work between Newcastle, Hull, and London at present.

The ARROL-JOHNSTON "Victory" Car, at £700, complete, is built in Aircraft Specification Material by the manufacturers of the famous "Beardmore" Aero Engine.

Sheffield.

On Sept. 18th over 200 people witnessed 19 passenger flights in an Avro machine at the Coal Aston aerodrome. Ten of those passengers were winners of the "Yorkshire Telegraph and Star" free flights. One of the winners had bought 20 copies of the paper in order to stand a good chance of a flight.

On Sept. 20th, the only other day that flying was possible during the flying week, on account of the weather, 17 passengers were taken up. Ten free flights were given by the "Sheffield Daily Telegraph."

The flying week being over, Capt. Lewis (late R.A.F.), and his party left Sheffield for London on Sept. 21st.

If Mr. Lloyd George flies to Sheffield for his visit on Oct. 14th he will probably arrive on a Vickers-Vimy "Commercial" machine.

IRELAND.

Information was received in Belfast on Sept. 24th that a Handley Page aeroplane, built by Harland and Wolff, had accomplished its 650 miles journey from Aldergrove, Co. Antrim, to Folkestone in 4 hrs. 18 min. This gives the machine an average speed of 140 m.p.h.

[No statement is made as to the direction and velocity of the wind, nor as to the fate of the machine after delivery at Hawkinge.—Ed.]

AFRICA.

South.

Some reference was made in the issue of The Aeroplane for Sept. 10th to the activities of Col. Armes (late R.A.F.), and Major Miller (late R.A.F.), in South Africa.

According to the "Daily News" of Sept. 25th the service between Johannesburg and Pretoria is hoped to be started on Oct. 1st. Both those towns have excellent aerodromes, and are stations on the Cape-Cairo air routes. Three machines have already arrived at Capt Town for the air service.

West.

Two French aviators will shortly make prospecting flights from Dakar to Timbuctoo, and from Dakar to French Guinea and back.

THE ARGENTINE.

The Argentine Government is interested in the acquisition of seaplanes for possible mail service. The few machines which have been exhibited at Buenos Aires have proved to be unsatisfactory. Exhibition flights are being given by European companies.

AUSTRALIA.

An inspection of the Malavan Archipelago was recently made by Mr. M. Anderson, of Aerial Service, Ltd. (Australia). He declared that the London-Australia flight is only practicable if the route follows a series of landing stations at every available site in Asia.

Darwin, in the Northern territory of South Australia, is covered with dense jungle or loose rocks. The making of landing stations in that district would take some months.

The Australian end of the Archipelago presents the most serious obstacles. Between Darwin and Sydney low bush covers a great deal of the ground. Mr. Anderson stated that the safest time for the flight is in the summer.

DENMARK.

The Danish correspondent of The Aeroplane writes :—

It is reported from Copenhagen that the commercial aviation company, Dansk Luftexpres, which will be remembered to have made a start with German Sablatnig land-going aircraft, is preparing a Copenhagen-Gothenburg-Frederikshavn (or Skagen) service with 10 Friedrichshafen seaplanes. The single-trip fare will cost 200 crowns (about £11). The Swedish consent for establishing a seaplane base in Gothenburg is being sought.

FRANCE.

A correspondent of The Aeroplane writes from France :—

The Paris-Lille, Paris-Brussels, and Paris-Cabourg (for Deauville and Trouville) air services cease working as daily services after the end of October. During the winter they will only be worked when and as required.

The Charges for Air Transport

Passenger fares for French aerial transport services next year are to be fixed, it is reported, at 50 centimes per kilometre—roughly, 8d. per mile. This charge covers 10 kilogrammes of personal luggage.

In a straight line the distance Paris-London is 350 km. approximately, and at the above rate the fare would be 175 francs—£7 at pre-war exchange rates—or a little under £5 at the present rate. This figure, of course, is the result of the French Government's efforts to assist commercial enterprise in an intelligent manner.

Comparing this figure with the rates quoted by British aerial transport concerns it would appear that the efforts of the Department of Civil Aeronautics, of the Air Ministry, entirely to suppress British aerial enterprise are likely to be crowned by a very early success.

Some French Experiments.

French activity in the matter of man-propelled aircraft appears to be on the increase.

Poulain—backed by the French Nieuport concern—is again to attempt to win the Peugeot prize, this time with an air-screw drive added to his flying bicycle.

An aviette has been designed by M. de Monge, of the Lumière Propeller concern, for a well-known French acrobat who has the habit of looping on an ordinary "push" bicycle. It is not yet proposed to loop the aviette, however.

The machine is to be a variable surface biplane driven by a Lumière Propeller, and the pilot—in a prone position—is totally enclosed in a streamline fuselage.

In addition, M. Mamet has in course of construction a pedal-driven biplane upon which he hopes to astonish the world. As the total weight is given at 185 k.g. (407 lb.), seems improbable that he will succeed—at any rate, in the intended manner.

M. Damblanc has a helicopter nearly ready for trials and for exhibition at the Aero Show. This machine is said to be a really serious effort, having received the approval of the French "Section Technique." It is also stated that the calculations regarding the apparatus are vouched for by an eminent French mathematician and that the machine may be expected to perform.—J. S.

The Salon Aeronautique.

The following firms are a few who have signified their intention of exhibiting at the VIe. Salon Aeronautique to be held in Paris in December. De Marçay, Caudron, Farman, Latécoëre, Bréguet, Levasseur, Lioré et Olivier, A. Bernard, Nieuport, Morane, L. Clement. This list is not complete, as many other firms have promised to exhibit this year.

GERMANY.

The Danish correspondent of The Aeroplane writes :—

One of the first German pilots, Brunnhuber by name, years ago put up a four-passenger carrying would's record in a 50-h.p. Gnôme-engined Albatros-built Farman box-kite. He was engaged (afterwards) as chief instructor at the German military aviation centre at Doberitz. Evidently, either he was thrown out of the job or preferred to leave under the present conditions prevailing in German military aviation places, as he has accepted a position as acro chauffeur to two people owning aeroplanes. The other day he returned by air in this capacity to Johannisthal from one of the seaside resorts.

A New Airship Service.

According to the "Daily News" of Sept. 27th, a Zeppelin service between Berlin and Stockholm has been arranged jointly by the Deutsche Luftschiffahrts-Actiengesellschaft and the Swedish Air Traffic Company. The airship "Bodensee" will be used on the service, and the fare for the trip is expected to be about £25.

The paper also states that an American mission recently travelled in the airship from Berlin to Friedrichshafen to inspect the Zeppelin works and to discuss the suitability of this type of airship for commercial work in America.

A Flight.

A correspondent writes from Holland :—

The properties of the well-known aeroplane manufacturer, Fokker, have been confiscated by the tax authorities at Schwerin, as Herr Fokker has left Germany without paying the 14,000,000 marks which he owed for taxes. Herr Fokker is of Dutch birth. He is said, however, to have become a German citizen before the war.

According to the "Berliner Zeitung am Mittag," Herr Fokker is said to be still a Dutchman. This paper says further, that Herr Fokker, who is at the present moment in England, has told English journalists all kinds of fairy stories about new inventions which he said he had made shortly before the end of the war, which were much worse than any previous horrible inventions of similar kind.

On inquiry at the British Consulate at Rotterdam one found they did not believe for a moment that Herr Fokker was in England.—N. C.

HOLLAND.

A correspondent writes from Holland :—"There is shortly expected in Holland a large flying machine of the Deutsche Luftschiffahrt Reederei. The machine will probably land on the E.L.T.A. ground or at Soesterberg. This visit is connected with the discussions now going on as to a regular service from Holland to Denmark via Germany.—N. C.

INDIA.

A Reuter's message from Simla, dated Sept. 24th, stated that the Government of India are advocating the formation of a big company, independent of any aircraft construction com-

THE BAKER AIR SEXTANT

The perfection of this instrument is a triumph of British science and mechanical skill and accuracy.

HUSUN

REGD. TRADE MARK

The great reputation which "Husun" aeronautical instruments quickly gained surprised nobody who knew the fame that "Husun" instruments have had for generations among the world's navigators.

We claim for our instruments the highest possible accuracy and reliability. We can offer quick delivery of the

GRIPOLY BELTING

Solid Woven with triple twisted indestructible edges

Get the most out of your Machinery

by using a belt which does not slip or stretch and which *grips*. A slipping belt in your works is as bad as a leaking petrol tank in your motor car. "Gripoly" has proved itself under test to be the most efficient all round belting. It does not stretch or slip; it resists heat, damp, grease, friction and guide forks as no other belting can. Have the best belting and get the utmost power from your machines.

LEWIS & TYLOR LIMITED,

GRANGE MILLS, CARDIFF, and 51, Gracechurch St., London, E.C.3.

Let us know your requirements and we will advise you as to the best type of "GRIPOLY" for your needs.

pany, with a monopoly for the carriage of mails for 10 years on the same lines as the P. and O.

The Board to advise the Commerce Department has sanctioned the proposal to establish aerodromes at Calcutta, Bombay, Karachi, Nagpur, Madras, Rangoon, Singapore, and Delhi.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

On Aerial Mails.

Two seaplanes left Brindisi for Athens a few days ago, arriving safely, though one had to stop for adjustments at Patras. Presumably the flight was undertaken in view of the mail service to be started sooner or later.

The Sardinian Postal Authorities are running regular inland postal services between Terranova, Sassari, Caglieri, and Macomer. Similar linking up of the interior of Sicily is officially announced, and a direct Rome-Turin express mail is likely to be started even quicker than its best friends dreamed owing to the telegraph people's discontented state of mind.

Landing-Ground Alterations.

A high personage in the Air Ministry, interviewed by the "Corriere della Sera," is quoted as suggesting much longer taking-off places or the supplementing of present ones by small additional levelled places in line with the main aerodromes. This is to avoid the recent most frequently fatal results of engine failure before altitude has been attained, which generally causes the pilot to try to turn back to the aerodrome.

A Dutch Purchase.

The same H.P. mentions the imminent purchase of a whole seaplane squadron by Holland—probably the mixed Macchi and Savoia which left for that country recently.

The Verona Disaster.

I was present at the commemoration of the five Press representatives who lost their lives in the Verona crash at the Ansaldo aerodrome at Turin. The Hon. Montu, President of the Italian Aero Club, etc., etc., addressed us at length on the future, sparing neither the performing pilots nor the highest authorities. He announced the advantage of having Milan papers at Rome a day earlier than the train could get them there during the recent newspaper strike, and also the institution of an annual competition on a fixed course which the Government is said to be arranging.

Flying services with passengers are being held up considerably as a consequence of the recent disasters. On the other hand, papers and express matters will receive the benefit of the space occupied by Pressmen and enthusiasts in the past. The Milanese papers are reaching Rome a day earlier, for instance, and Turin is receiving express letters half a day earlier. One is inclined to think that the public will appreciate these material advantages more than glowing newspaper accounts of aerial travel.—T. S. H.

SPAIN.

Capt. Truelove and his red and yellow Avro have arrived safely in Spain. General Echague, commanding the Spanish Flying Corps, has been taken up by Capt. Truelove and much enjoyed his flight. He displayed great interest in the type of machine on which the British fighting pilots were trained. It is understood that His Majesty King Alfonso is acquiring this Avro.

SWEDEN.

The Danish correspondent of THE AEROPLANE writes :—

From Stockholm is reported that the Swedish Government has been offered a great number of British Government property aeroplanes, being new aircraft of an original cost of £1,800 each, and to be sold now at half price. The English Government is stated intending altogether to dispose of 10,000 aeroplanes.

SWITZERLAND.

An aviation meeting at Neufchatel began on Sept. 15th and ended on Sept. 22nd. Many French aviators took part, and the proceedings were attended by thousands of spectators.

Captain Bradley, on an 110-h.p. Le Rhône Avro biplane, recently arrived at Lausanne from London, having flown *via* Paris and Dijon. He crossed the Jura Alps and suffered greatly from the cold. He landed safely at Lausanne, where the machine was purchased by the Swiss Aero Club.

UNITED STATES OF COLOMBIA.

An experimental aerial mail service has been inaugurated between Barranquilla and Puerto Colombia, United States of Columbia (South America). It is reported that a special issue of aerial postage stamps, restricted to 200, has been sanctioned by the State in connection with the service.

UNITED STATES OF AMERICA.

The New York-Toronto Air Race.

The order of finishing and the flying times of the contestants in the American Aerial Derby of 1,042 miles are now available, and are as follows :—

Lieut. B. W. Maynard, D.H.4, 465¼ min.
Lieut. H. H. George, D.H.4, 520⅝ min.
Lieut. D. B. Gish, D.H.4, 524¼ min.
Col. G. C. Brandt, D.H.4, 545¼ min.
Lieut. M. J. Plumb, D.H.4, 550⅝ min.
Lieut. P. H. Logan, Le Père, 562 min.
Lieut. Ben Adams, D.H.4, 564 min.
Lieut. John P. Roullot, D.H.4, 570¼ min.
Major R. Schroeder, V.E.7, 572 min.
Serjeant C. B. Coombs, D.H.9, 576 min.
Col. H. E. Hartney, S.E.5A, 589⅜ min
Lieut. R. T. Midkiff, D.H.4, 597½ min.
Lieut. Ross Kirkpatrick, D.H.4, 602¼ min
Lieut. C. F. Brown, D.H.4, 607¾ min.
Lieut. Charles Colt, S.E.5A, 621⅓ min.
Lieut. F. T. Honsinger, D.H.4, 635 min.
Roland Rholfs, Oriole, 667¼ min.
Capt. C. W. Cook, Fokker, 759½ min.
Major A. B. Gilkeson, D.H.4, 764¼ min
C. S. Jones, J.N.4D, 833⅓ min.
Lieut. W. R. Taylor, J.N.4H, 836⅓ min.
Capt. H. B. Chandler, J.N.4H, 895¼ min.
Capt. R. H. Depew, J.N.4D, 898⅓ min.
Capt. S. S. Moore, Can. J.N.4, 912½ min.
Lieut. L. W. Bertrand, Can. Trng., 1,285¼ min.
Lieut. Wallace Young, J.N.4H, 1,313⅓ min.
Col. Wm. C. Barker, Fokker, 1,434⅓ min.
Lieut. C. A. Schiller, Can. J.N.4, 1,520¾.
Major J. W. Simons, D.H.4, 1,536¾.
O. S. Parmer, Standard, 3,323 min.

It says much for the speed and general excellence of the D.H.4 machines, fitted with Liberty engines, that they obtained the first five places, also the seventh and eighth, and had a very good record throughout the race. It seems strange that they could beat the S.E.5s, and also the two Fokkers, of which a great deal more was expected than that one would come in at the end of the race, and the other in the middle.

[But to those who know the real speeds of the much-advertised S.Es. and Fokkers it is quite natural.—ED.]

The civil pilot who made the best time and gained the $10,000 was Roland Rholfs, who came in sixteenth in the race, and was flying a Curtiss Oriole. On starting from Toronto, Rholfs turned an Oriole machine on its back and delayed the start. There were 52 entries for the flight and 28 finished the course. Three pilots made second starts after failing in the first attempts.

Seaplane Tours.

A conference was held recently at the Curtiss Flying Station in Atlantic City to discuss plans for seaplane cruises. Capt. Charles J. Glidden and Mr. Henry Woodhouse, high officials of the Aerial League of America, were present.

Among the seaplane tours announced by Capt. Glidden will be cruises from Atlantic City to Baltimore, Washington and Norfolk, and from Atlantic City to Florida and the Gulf. Other cruises will visit New England ports, while others will follow the Mississippi and other great American rivers.

Seaplane cruises from Atlantic City to New York and up the Hudson will be among the first to be organised. Capt. Glidden also announced that winter cruises on the Pacific and Gulf Coast will be organised this year.

According to the "Times" of Sept. 29th :—Tentative plans are now under consideration for a seaplane flight from San Diego (California) to the Philippines, via Hawaii and Wake Island (north of the Marshall Islands), and Guam.

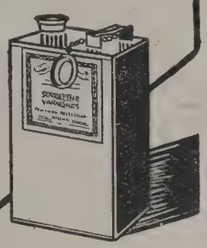
New Air Routes.

The Curtiss Aeroplane and Motor Corporation will establish shortly three new passenger air routes. A service from New York to Rochester may be started in the autumn. The other two routes, which will probably open next spring, are between Erie and Pittsburg and Hamilton and Toronto in Canada.

The Aerial Mail Service.

The most difficult part of the route of the mail service has been found to be over the mountains from New York to Bellefonte (Pa.). Early morning ground fogs are very thick and the winds are very variable and changeable. The weather varies the speed of the mail aeroplanes so much that the stage is sometimes flown at 132 m.p.h. and sometimes at 81 m.p.h. In a period of nearly two months, on four occasions the wind was strong enough to reduce the speed to less than 60 m.p.h.

A PERFECT finish is assured if you are using NAYLOR'S AERO Varnishes, Paints, and Enamels to all specifications for Woodwork, Metal Parts, Wings, etc., etc.



Passed A.I.D. at our works.

AIRCRAFT FINANCE

The Fall in Aircraft Shares.

The fall in aircraft shares, following the Government's saving scheme, has produced some comment in the daily Press. Publicity, so long as it is not an exaggeration or misinterpretation of facts for political motives, is welcome; it is likely to do good; it cannot do harm, though the truth is sometimes unpalatable. It is a platitude that, unless national expenditure is made to conform more with the income, the situation must become increasingly menacing and ugly. One also realises that the process of assimilation is calculated to be really painful to some as well as unpleasant to the majority who unwillingly come into direct contact with the pruning-knife.

The Capital at Stake.

Admittedly the end justifies the means, but with some reservations so far as the Aircraft Industry is concerned. It ought to be clearly understood that the capital at stake is not inconsiderable. The "cut" in Government orders was inevitable, and therefore calls for no comment. But it is different with the moral obligations of the Government. No matter what anyone may claim, aircraft were, and still are, in the experimental stage, and those who subscribed the capital at stake had the negative satisfaction of seeing very beneficial results to the nation at large, without any corresponding pecuniary reward.

No Policy: the Parallel of Shipping.

Now the Authorities are doing the worst possible thing by leaving the Industry, if not exactly in the lurch, in a condition of suspense. If it drifts aimlessly without any guiding policy from the central authority, the financial effect is calculated to grow more serious. It is not spoon-feeding that is needful; it is a definition of national policy. Direct doles would be harmful; but if one takes the parallel of the shipping industry, there is a basis to work on. The shipping industry receives a subsidy in respect of mail and other things; this is payment for services rendered, and valuable services, so that there is no flavour of charity. Why not similar subsidies for aviation? The cost would be small, and the reward would be proportionately large, once things settled down on an actual commercial basis. The suggestion that aviation is not yet sufficiently advanced to justify such a charge on the national revenue is unreasonable.

The Disadvantages of Profitable Alternatives.

The average investor risked money in aircraft ventures, firstly, because of the novelty and, secondly, because of the belief that in national interests the Government would accord a certain small measure of support. From all accounts, other countries appear to realise better the obligations in this respect. The shares have fallen away in value, but not because of any inordinate quantity of selling. The manufacture of milk-cans may prove an excellent source of profit, and there are other side-lines and alternatives. This is all very well; but, if circumstances ultimately force the manufacture of "extras" to a primary position and aircraft is side-tracked, the change over would necessarily imperil the national efficiency in aviation. That would be disastrous.

Individual Share Movements.

As to the fluctuations in share values, Aircraft Manufacturing "B" Preference have been dealt in up to 14s. 9d., but the quotation was down to 13s. 6d.—14s. 6d., and the "A" are about the same level, having also recovered. The 7 per cent. Short Term Notes, due 1921-5, have changed hands at 96, a price which represents a very big yield if held till maturity. A slight recovery to 16s. 3d. has occurred in Peter Hooker Preference. Waring & Gillows show little improvement. There has been a reaction to 35s. in Vickers Ordinary; the new shares are purchaseable sixpence or so lower; both rank equal now, and would constitute very good investments.

MORTGAGES AND CHARGES.

Mayrow Industrial Systems, Ltd.—Charge on leasehold premises, 23, Flood Street, Chelsea, with contents, furniture at 39, Victoria Street, S.W., contracts in hand, patents, etc., dated July 18th, 1919, to secure £3,000 and bonus of £600. Holder: A. W. P. Kemp.

AN AGENCY IN AMERICA.

An agency for the British and Colonial Aeroplane Co., Ltd., has been opened at 512, Fifth Avenue, New York, by Mr. William G. Ranels.

A NEW AMERICAN COMPANY.

The Interallied Aircraft Corporation have recently been incorporated in New York. They will sell and manufacture aeroplanes, seaplanes, engines and accessories. They have twenty-five Curtiss training machines for immediate delivery.

Col. W. A. Bishop, V.C., D.S.O. (late R.A.F.), is the president of the company, and Major, W. G. Barker, V.C., D.S.O. (late R.A.F.), is a vice-president.

AIRCRAFT INSURANCE.

Bray, Gibb, and Co., Ltd., of 166, Piccadilly, wish it to be known that they are willing to give advice and assistance with regard to aviation insurance. As to the cost of such insurance this company state that it is impossible to give particulars of rates available because each risk must be treated on its own merits.

ERSATZ CASTINGS.

In view of the strike of 50,000 ironfounders from practically every foundry in the Kingdom, Barimar, Ltd., have arranged to place their large staff of expert welders at the disposal of machinery owners and users whose businesses are held up for the want of new castings. It is often possible to repair every kind of metal by metal fusion in a few hours.

A CHANGE OF ADDRESS.

In order to cope with their greatly increased business—both export and in London and the Home counties—Dunford and Elliott (Sheffield), Limited, the well-known firm of steel manufacturers, have found it necessary to open their own offices in London, at 4, Copthall Buildings, Copthall Avenue, E.C.2, and in future all communications in connection with steel, etc., for export or for delivery in London and the South of England should be sent to the new address.

The general management of the London office is in the hands of Mr. Ivor S. Winby, who has hitherto controlled Messrs. Dunford and Elliott's export business, whilst the services of their London Agent, Mr. E. St. Clair Duncan, are retained in the capacity of sales manager.

A TESTIMONIAL.

The following is an extract from a letter received by C. A. Vandervell and Co. from Mr. F. L. Rapson:—

"As you are probably aware, my Rolls-Royce car is about to start on an official 10,000-mile tyre test under R.A.C. supervision, and as the same C.A.V. outfit is still in use on this car as *originally fitted*, with a mileage of 117,000, I have decided to send the car into your works to have the electrical installation thoroughly overhauled. You will be interested to hear that during the entire mileage recorded above, 73,000 of which were on war work, I have never been held up for a single moment due to electrical troubles."

AIR FORCE.

FROM THE "LONDON GAZETTE."

AIR MINISTRY, September 23rd.

R.A.F.—PERMANENT COMMISSIONS.—The notification appearing in the "London Gazette" of Aug. 1st appointing the following officers to permanent commns. is cancelled :—Lt.-Col. A. E. Cairnes, D.S.O., Maj. W. D. S. Sanday, D.S.O., M.C. (A.); Capt. C. H. Darley, D.S.C., D.F.C. (A.); Capt. E. J. L. Gilchrist, M.C., D.F.C. (A.); Capt. T. E. B. Howe, A.F.C. (A.); Capt. P. E. M. Le Gallais, A.F.C. (A.); Capt. A. S. Redfern (A.); Capt. G. M. T. Rouse (A.); Lt. N. S. Dewey, M.C. (A. and S.); Lt. R. R. Evans (A.); Lt. G. G. G. Graves (A.); Lt. H. N. Loch (A.); Lt. D. S. Robertson (A.); Lt. A. W. Simon (A.); Lt. P. L. Stephens (Ad.); Lt. W. F. Williamson (A.).

The surname of Lt. E. J. D. Townesend (S.O.) is as now described, and not "Townshend," as in "Gazette" of Aug. 1st.

The initials of Lt. J. W. Nixon (Ad.) are as now described, and not "L. M.," as stated in "Gazette" of Aug. 1st.

The following temp. appts. are made at the Air Ministry :—Staff Officers, 2nd Class.—Air.—Flt. Lt. D. S. K. Crosbie, Aug. 27th; Flt. Lt. F. N. Halsted, D.S.C., Sept. 15th.

The following temp. appt. is made :—Staff Officer, 1st Class.—Air.—Wing Comdr. A. W. Bigsworth, C.M.G., D.S.O., A.F.C., Sept. 17th, vice Sqdn. Ldr. C. E. Maude.

FLYING BRANCH.—The following Majs. are graded for purposes of pay and allowances as Lt.-Cols. whilst empld. as Lt.-Cols. (A. and S.) :—J. S. Mills, D.S.C., from April 22nd to July 31st; S. H. B. Harris, A.F.C., from May 1st to Aug. 9th.

The following Capts. are graded for purposes of pay and allowances as Majs. whilst empld. as Majs. (A.) :—I. N. C. Clarke, D.S.C., to May 17th; C. J. Truran, A.F.C., to June 30th; J. H. D'Albiac, D.S.O., from July 24th to July 31st, May 1st.

Capts. to be graded for purposes of pay and allowances as Majs. whilst empld. as Majs. (K.B.) :—A. T. Moore, O.B.E., M. H. Spencer, to June 29th, May 1st.

Capt. K. B. Harborn to be Capt. (A.), from (S.O.), March 15th (substituted for the notification in the "Gazette" of July 15th).

Lt. (Hon. Capt.) C. E. Holman to be actg. Capt. whilst empld. as Capt. (A.), from Oct. 31st 1918, to April 30th.

The following Lts. are graded for purposes of pay and allowances as Capts. whilst empld. as Capts. (A.) :—J. D. Seal, from May 1st to June 30th; S. B. Collett, from May 17th to July 31st; C. G. Mathew, July 8th.

Lt. (Hon. Maj., actg. Capt.) G. T. Barry to be Lt. (Hon. Maj., K.B.), and relinquishes the actg. rank of Capt. on ceasing to be empld. as Capt., June 1st.

Lt. G. H. Langley relinquishes the grading for pay and allowances as Capt. on ceasing to be empld. as Capt. (A.), July 24th.

Flying Officer H. B. Pett, M.C., relinquishes the grading for pay and allowances as Flt. Lt. on ceasing to be empld. as Flt. Lt. (A.), Sept. 1st.

Flying Officer M. A. Benjamin, M.C., to be Flying Officer (A.), from (S.O.), Aug. 19th.

Sec. Lts. to be Lts. :—H. C. Wright, April 28th, 1918; C. E. Tidy, March 23rd; P. J. Dowell, March 27th (substituted for the notification in the "Gazette" of July 29th); Alex. Shepherd, May 4th (substituted for the "Gazette" of July 29th, wherein this officer was described as "Arthur Shepherd").

Sec. Lt. D. O. Onslow-Carleton (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt. (A.), Feb. 11th.

W. R. Wood (temp. Sec. Lt., Manch. R.) is granted a temp. commn. as Sec. Lt. (O.), May 18th, 1918.

The following relinquish their commns. on ceasing to be empld. :—Lt. W. B. Ferrier (Lt., Cent. Ont. R.), Sept. 10th; Capt. J. H. C. Minchin (Capt., Sco. Rif.), Sept. 15th; Sec. Lt. N. Cave (Lt., R. Sussex R.), Sept. 16th.

Transferred to the unempld. list :—Sec. Lt. D. J. Brebber, Sec. Lt. N. Duncan, Sec. Lt. J. W. Eastman, Sec. Lt. C. W. Graburn, Feb. 1st; Lt. H. F. Dugall, Feb. 15th; Sec. Lt. E. S. Alger, March 20th; Capt. J. D. Stodart, March 24th; Sec. Lt. F. E. Finlay, April 1st; Sec. Lt. J. A. Wrighton, April 15th; Sec. Lt. A. Roche, April 19th; Lt. F. L. Wills, April 22nd (substituted for notification in "Gazette" of June 13th, wherein this officer was described as "Lt. F. L. Willis"); Lt. H. S. Starling, April 25th; Lt. C. W. Cook, Lt. (actg. Capt.) G. C. Dixon, April 30th; Lt. J. F. Thompson, May 1st; Sec. Lt. H. L. Wood, May 2nd; Sec. Lt. W. H. R. Jarvis, Lt. A. B. Massey, A.F.C., May 20th; Sec. Lt. H. R. Hayden, May 25th; Capt. F. U. Y. Weldon, May 28th; Sec. Lt. T. O. James, June 13th; Lt. G. W. Hockey (substituted for the notification in "Gazette" of June 27th, wherein this officer was described as Sec. Lt. G. W. Hockey); Lt. (Hon. Capt.) S. H. Holland (substituted for notification in "Gazette" of May 16th), June 16th; Sec. Lt. A. L. V. Jaussonius, June 17th; Lt. S. McB. Black, June 30th; Sec. Lt. J. D. W. Hindson, Sec. Lt. F. L. W. Irving, July 12th; Flying Officer C. E. Young, Aug. 6th; Flying Officer D. T. C. Rundle-Woolcock, Flying Officer H. W. Wheatley, Aug. 8th; Pilot Officer W. N. Jackson, Pilot Officer H. H. Jager, Pilot Officer J. L. Wilcock, Aug. 10th; Flying Officer R. V. Curtis, Pilot Officer R. Isaacs, Aug. 14th; Flying Officer A. A. James, Aug. 15th; Flying Officer D. W. Stuart, Flying Officer A. Ward, Aug. 26th; Pilot Officer G. J. Farnworth, Flying Officer J. G. Robertson, Aug. 27th; Pilot Officer A. M. Flanigan, Flying Officer W. C. Jeffries, Aug. 29th; Pilot Officer S. C. Rainbow, Aug. 30th; Flying Officer J. H. Page, Pilot Officer W. G. Pearson, Sept. 1st; Pilot Officer (Hon. Flying Officer) H. W. Lester, Sept. 2nd; Flying Officer E. J. O. Ross, Sept. 3rd; Flying Officer R. F. Palmer, Flying Officer W. Rogers, Sept. 6th; Pilot Officer V. C. Davis, Sept. 8th; Pilot Officer A. F. Nelson, Pilot Officer (Hon. Flying Officer) H. A. Pound, M.C., Sept. 9th; Pilot Officer G. Exley, Flying Officer S. C. T. Littlewood, Sept. Keen, Sept. 12th; Pilot Officer J. W. Sinton, Sept. 13th; Flying Officer W. G. Brind, D.F.C., Flying Officer V. C. Hemsley, Pilot Officer V. G. Record, Pilot Officer J. G. Walton, Sept. 16th; Pilot Officer L. T. Corbett, Flying Officer W. H. Davies, Sept. 17th; Flying Officer G. D. Longfellow, Sept. 18th; Flying Officer G. H. L. Cox, Pilot Officer L. J. Hall, Flying Officer W. T. Ward, Sept. 20th; Pilot Officer F. Cox, Sept. 22nd; Pilot Officer W. H. C. Robson, Sept. 23rd.

Maj. F. W. Honnett relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Sept. 9th.

Lt. W. E. Joseph, R.F.A., relinquishes his commn. on account of ill-health caused by wounds, and is granted rank of Capt., Aug. 22nd.

The following Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank :—K. D. MacLeod, July 12th (substituted for notification in "Gazette," Feb. 28th); L. A. Bushe (contracted on active service), July 19th; R. S. V. Morris, Aug. 3rd, 1918.

Lt. E. R. Gunner resigns his commn., Sept. 24th.

The following Sec. Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank :—E. S. Noble, July 12th; P. V. Tempest, Sept 13th.

Sec. Lt. G. Hughes to take rank and prec. as if his appt. as Sec. Lt. bore date Jan. 11th.

Sec. Lt. S. N. Giroux to take rank and prec. as if his appt. as Sec. Lt. bore date Oct. 24th, 1918.

The notification in "Gazette," July 16th, 1918, concerning Sec. Lt. M. E. Miller is cancelled. The notification in "Gazette," April 9th, 1918, stands.

The notification in "Gazette," April 11th, concerning Lt. E. F. Jones is cancelled.

The notification in "Gazette" of July 11th concerning Sec. Lt. A. G. Ely is cancelled.

ADMINISTRATIVE BRANCH.—Maj. R. Cockburn, O.B.E., is graded for pay and allowances as Lt.-Col. whilst empld. as Lt.-Col., from May 1st to July 30th.

Maj. A. E. Loder to be Maj., from (S.O.), July 18th.

Sqdn. Ldr. G. H. Thomson, O.B.E., to be Sqdn. Ldr., from (S.O.), Aug. 29th.

Flying Officer (Hon. Flt. Lt.) D. C. G. Sharp to be actg. Sqdn. Ldr whilst empld. as Sqdn. Ldr., Aug. 1st.

Capt. H. C. Mallett, M.B.E., is graded for pay and allowances as Maj. whilst empld. as Maj., May 1st to July 12th.

Flt. Lts. to be Flt. Lts., from (S.O.) :—F. J. Gray, O.B.E., Aug. 1st (substituted for notification in "Gazette" of July 4th); G. M. Broadburn, A. Warnock, Aug. 15th.

The following Lts. are graded for pay and allowances as Capts. whilst empld. as Capts. :—L. B. Nicholls, May 1st; A. H. Tarper, from May 1st to 19th; F. W. H. Durrant, from (T.), from May 1st to Aug. 16th.

Lt. (Hon. Maj.) A. J. Battine is graded for purposes of pay and allowances as Capt. whilst specially empld., June 8th.

Lt. H. Gwynne-Smith relinquishes grading for purposes of pay and allowances as Capt. on ceasing to be empld. as Capt., June 30th.

Lt. A. Eggar to be Lt., from (S.O.), July 5th (substituted for notification in "Gazette" of July 22nd, wherein this officer was described as L. A. Eggar).

Flying Officers to be Flying Officers, from (S.O.) :—J. A. H. Savage, Aug. 15th; H. C. Pyper, Sept. 1st.

Sec. Lts. to be Lts. :—(Hon. Lt.) L. B. Clarkson, April 2nd, 1918; W. Simmonds, Jan. 10th; W. R. Wood, Feb. 1st (substituted for notification in "Gazette" of Feb. 4th); E. P. Woodman, June 20th.

Sec. Lt. W. R. Wood to be Sec. Lt., from (O.), Oct. 8th, 1918 (substituted for notification in "Gazette" of Nov. 5th, 1918).

Sec. Lt. H. Preston (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt., Sept. 28th, 1918.

Lt. D. S. Cairnes (Lt., Rif. Bde.) relinquishes his commn. on ceasing to be empld., June 17th.

Transferred to unempld. list :—Lt. E. F. Jones, March 29th; Lt. F. A. Whitfield, April 12th; Sec. Lt. R. H. Walker, April 14th; Lt. O. O'Conner, April 30th; Lt. N. S. Cameron, May 1st; Sec. Lt. H. Hopkinson, May 18th; Sec. Lt. G. Lovett, June 16th; Lt. C. P. Robertson, June 30th; Lt. G. V. Walsh, July 8th; Lt. A. T. Redgwell, July 17th; Capt. S. M. Wood, July 25th; Pilot Officer W. R. G. Williams, July 11th; Pilot Officer (Hon. Flying Officer) C. O. Coton, Aug. 26th; Flt. Lt. W. H. Mainprize, Sept. 3rd; Pilot Officer E. G. Burden, Pilot Officer D. J. Fryer, Flying Officer (Hon. Flt. Lt.) C. J. Trail, M.C., Sept. 12th; Pilot Officer F. P. Carroll, Pilot Officer H. F. Hendry, Sept. 13th; Flt. Lt. E. Newing, Flying Officer (Hon. Flt. Lt.) R. A. Shepheard-Walwyn, Sept. 16th; Flying Officer F. A. Whitfield, Sept. 20th.

The following Sec. Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank :—K. D. Kayler, May 20th (substituted for notification in "Gazette," Jan. 10th); G. J. Murphy (contracted on active service), July 12th; C. W. Tuck, July 12th (substituted for notification in "Gazette," Jan. 7th).

The notification in "Gazette," July 22nd, concerning Sec. Lt. G. J. Murphy is cancelled.

The notification in "Gazette," Feb. 28th, concerning Lt. B. W. Blayney is cancelled.

The notification in "Gazette," Aug. 9th, 1918, concerning Lt. C. R. Ansell (R.W. Surr. R.) is cancelled.

The notification in "Gazette," Aug. 2nd, 1918, concerning Sec. Lt. R. S. V. Morris is cancelled.

The notification in "Gazette," Feb. 21st, concerning Lt. N. Smith is cancelled.

The notification in "Gazette," May 23rd, concerning Sec. Lt. C. H. Marston is cancelled.

The notification in "Gazette," Oct. 15th, 1918, concerning Sec. Lt. H. Preston is cancelled.

TECHNICAL BRANCH.—To be actg. Majs. whilst empld. as Majs., Grade (A.) :—Capt. K. D. Abercromby, from (Ad.), April 1st, 1918 (substituted for the notification in the "Gazette" of April 19th, 1918); Lt. T. L. F. Burnett, M.B.E., May 1st (substituted for notification in the "Gazette" of July 15th).

The following Capts. are graded for purposes of pay and allowances as Majs. whilst empld. as Majs., Grade (A.) :—J. Stewart, E. Holloway, O.B.E., to May 21st, May 1st.

Capt. W. J. Waddington relinquishes the grading for purposes of pay and allowances as Maj. on ceasing to be empld. as Maj., Grade (A.), July 25th.

Flt. Lt. N. V. Wrigley to be Flt. Lt., Grade (B.), from (S.O.), Aug. 1st.

Lt. (actg. Capt.) A. W. Furbank to be Lt., Grade (B.), and to relinquish the actg. rank of Capt. on ceasing to be empld. as Capt., Dec. 1st, 1918.

Lt. R. W. Lewis relinquishes the grading for purposes of pay and allowances as Capt. on ceasing to be empld. as Capt., Grade (B.), May 20th.

Lt. R. G. Whitcombe relinquishes the grading for purposes of pay

and allowances as Capt. on ceasing to be empld. as Capt., Grade (A.), July 21st.

Lt. K. I. Goodman to be Lt., Grade (A.), from (Ad.), May 17th, 1918 (substituted for the notification in the "Gazette" of Sept. 3rd, 1918).

Lt. (Hon. Capt.) G. M. Nobbs is graded for purposes of pay and allowances as Lt. whilst empld. as Lt., Grade (B.), Nov. 26th, 1918.

Lt. B. S. S. Rockey to be Lt., from unempld. list, Feb. 7th, with precedence next below Lt. A. S. Dunn.

Sec. Lts. to be Lts.:—(Actg. Capt.) W. W. Hammond, April 2nd, 1918, and to retain the actg. rank of Capt. until April 30th (substituted for notification in the "Gazette" of Aug. 29th); E. A. Gater, May 3rd (substituted for notification in the "Gazette" of July 29th).

V. G. Darrington (Lt., R.F.A.) is granted a temp. commn. as Lt., Grade (A.), Nov 5th, 1918, with seniority from April 1st, 1918 (substituted for notification in the "Gazette" of Nov. 26th, 1918).

Sec. Lt. (Hon. Lt.) H. R. Sterrett to be Lt., without pay and allowances of that rank, April 2nd, 1918.

Transferred to unempld. list:—Sec. Lt. C. H. Marston, March 7th; Capt. (actg. Maj.) L. S. Metford, April 19th (substituted for notification in the "Gazette" of Sept. 9th); Sec. Lt. (actg. Capt.) G. E. Hodges, April 30th (substituted for notification in the "Gazette" of July 11th); Sec. Lt. G. Wells, June 6th; Maj. C. A. L. Harrison, July 8th; Flying Officer B. S. S. Rockey (R.E.), Aug. 7th; Pilot Officer J. O. Cooper, Aug. 20th; Pilot Officer A. Robinson, Aug. 25th; Pilot Officer F. J. MacLennan, Sept. 1st; Flying Officer E. D. Inskip, Sept. 3rd; Pilot Officer E. J. Brooks, Sept. 5th; Flt. Lt. A. J. Boulter, Sept. 8th; Flying Officer J. H. Gladding, Pilot Officer P. F. Jessop, Sept. 11th; Flt. Lt. D. C. Waylen, M.B.E., Sept. 12th; Pilot Officer (Hon. Flying Officer) V. L. Henwood (substituted for notification in the "Gazette" of March 7th); Pilot Officer L. W. Scoggins, Sept. 13th; Flying Officer W. Duff, Flt. Lt. C. E. Elliott, Flying Officer F. H. Goodwin, Sept. 16th; Pilot Officer (actg. Flt. Lt.) J. H. Lytle, Flt. Lt. C. E. Stent, Sept. 17th.

Lt. C. M. Kelly relinquishes his commn. on account of ill-health caused by wounds, and is permitted to retain his rank, Sept. 9th.

The following are removed the Service, His Majesty having no further occasion for their services as officers:—Lt. A. C. Hankey, Sec. Lt. C. J. Young, Sept. 24th.

Medical Branch.—Transferred to unempld. list:—Capt. W. H. Payne, Feb. 24th; Sqdn. Ldr. (actg. Wing Comdr.) F. F. Muecke, C.B.E., Aug. 31st.

Memoranda.—The following relinquish their commns. on ceasing to be empld.:—Temp. Hon. Lt. F. W. Hedgecock, Aug. 20th; Temp. Hon. Lt. H. Bedson, Sept. 16th.

Transferred to the unempld. list:—Capt. (actg. Maj.) P. P. C. Penberthy, O.B.E., from (S.O.), April 30th; Flying Officer F. W. Hedgecock, Aug. 20th; Pilot Officer R. D. McE. Hart, Sept. 13th; Flying Officer H. Bedson, Sept. 16th; Sqdn. Ldr. G. W. Cranfield, M.B.E., from (S.O.), Sept. 17th; Sqdn Ldr. J. H. Hills, O.B.E., from (S.O.), Sept. 21st.

Sec. Lt. A. L. Maquard is dismissed the Service by sentence of a General Court-Martial, Aug. 20th.

The notifications in the "Gazettes" of Aug. 8th and Aug. 19th concerning Capt. P. P. C. Penberthy are cancelled.

The notifications in the "Gazette" of Aug. 22nd concerning Sec. Lt. R. J. Walker and Pilot Officer C. A. Russell are cancelled.

The notification in the "Gazette" of Sept. 9th concerning Capt. S. M. Wood is cancelled.

PERSONAL NOTICES.

NAVAL.

Engagement.

WILLIAMS—BRUCE.—The engagement is announced of Capt. W. T. S. Williams, D.S.C., R.A.F. (late R.N.A.S.), only son of the late Dr. Walter Williams, M.B., of Portmadoc, North Wales, and of Mrs. Williams, of St. Albans, Hertfordshire, and Ethel Marjorie, only daughter of Brig.-Gen. C. D. Bruce, C.B.E., of 31, Buckingham Gate.

MILITARY.

Engagements.

FROST—SNOWDEN.—The engagement is announced between Captain O. H. Frost, M.B.E., M.C., R.A.F., only son of the late Mr. Robert Frost and Mrs. Frost, of 11, Coleherne Road, S.W., and Pamela Lucy Mary, elder daughter of the late Mr. Herbert Snowden and Mrs. Snowden, of 80, Elm Park Gardens, S.W.

HARRIS—BURNS.—A marriage has been arranged, and will shortly take place, between Lieut. Kenneth Milner Harris, Suffolk Regt., attd. R.A.F., youngest son of the Rev Charles P. Harris, M.A., B.C.L., LL.D., Oxford, of Staplegrove Rectory, Taunton, Somerset, and of Mrs. Harris, and Alys, elder daughter of Mr. B. H. Burns and Mrs. Gower-Burns, Christchurch, New Zealand.

McCALMAN—NEALE.—The engagement is announced between the Rev. Hugh McCalman, M.C., Chaplain, R.A.F., only son of Lieut.-Col. and Mrs. McCalman, of Bournemouth, and Mildred Rosalie, youngest daughter of Mr. and Mrs. M. W. Neale, of Sutton, Surrey.

PORTER—STEPHENS.—An engagement is announced between Capt. Garthshore Tindal Porter, R.G.A. and R.A.F., eldest son of the late T. P. Porter, Esq., Government Surveyor, Queensland, Australia, and of Mrs. Porter, late of Cheltenham, and Christine Cecilia, elder daughter of Mr. and Mrs. Albert Stephens, Gloucester.

Marriage.

DEACON—RIDDEY.—On Sept. 25th, at Moreton-in-Marsh, Capt. G. R. A. Deacon, M.C., R.A.F., younger son of Mr. A. W. Deacon, J.P., of Swindon, was married to Edith Mary Riddey, elder daughter of Mr. J. A. Riddey, of Moreton-in-Marsh, Glos.

AIR FORCE.

Engagements.

JONES—STAFFORD.—The engagement is announced between Capt. C. N. Jones, A.F.C., late R.A.F., only son of the late Alfred G. Jones, of Shantung, China, and of Mrs. Jones, Elmhurst, Lonsdale Place, Derby, and Dorothy, elder daughter of the late George M. Stafford, of Sydney, Australia, and of Mrs. Stafford, 68, Holland Park Avenue, W.11.

LESLIE—TAYLERSON.—The engagement is announced between Kenneth Chapelow Leslie, late Lieut., R.A.F., of Launceston, Cornwall, and Doris Ellen, only daughter of Mr. and Mrs. Taylerson, of Stranton, Reigate.

LONGMAN—EDSALL.—The engagement is announced between Lieut. Reginald Longman, R.A.F., youngest son of Mrs. C. Longman, Wryde, Raymead Avenue, Thornton Heath, and Olive, eldest daughter of Mr. and Mrs. Percy Edsall, Hughenden, Dunheved Road North, West Croydon.

RODWELL—LIVOCK.—The marriage between Lieut. R. J. Rodwell, R.A.F., and Margery, eldest daughter of Mr. and Mrs. Livock, of Newmarket, will take place on Tuesday, Oct. 21st, at the Roman Catholic Church, Newmarket, at 2.30. There will be no reception, but all friends are welcome at the church.

Marriages.

COCKERELL—REED.—On Sept. 24th, at Ufton Church, Warwickshire, Major Henry Cockerell, O.B.E., R.A.F., son of the late Henry Cockerell and Mrs. Cockerell, of Osterley Park, was married to Amy Gertrude, daughter of Mr. and Mrs. Reed, of Ufton, by the Venerable the Archdeacon W. H. Hutton.

DALES—STRINGER.—On Sept. 23rd, at St. Nicholas, Kenilworth, Noel Mansfield Dales, late R.A.F., youngest son of the late Eli Dales, and of Mrs. Dales, of Bishops Wilton, Yorks., was married to Winifred Alice, only daughter of the late Major J. C. Stringer, Royal Warwickshire Regt., and of Mrs. Stringer, of Park Hill, Kenilworth, by the Rev. J. W. Dennis.

GODDARD—BERNARD.—On Sept. 16th, at Durley Church, Capt. Hubert E. Goddard, R.A.F., late E. Yorks Regt., younger son of Col. W. E. Goddard, J.P., V.D., D.L., and Mrs. Goddard, of Thwaite House, Cottingham, Yorks, was married to Enid Bernard, daughter of the late Mr. Edmund Bernard, J.P., and Mrs. Bernard, of Snakemoor, Botley, Hants, by the Rev. P. Koelle.

TAYLOR—LOCOCK.—On Sept. 20th, at St. Margaret's, Angmering, Capt. Bernard Archie Taylor, R.A.F., only son of Mr. and Mrs. A. Taylor, of Dunollie, Crawley, was married to Kitty, third daughter of the late Capt. H. F. Leicester Locock, and of Mrs. Leicester Locock, of Pooks Hill, Angmering, Sussex.

OCTOBER 8, 1919.

THE AEROPLANE

VOL. XVI. No. 15.

The Editorial and Advertising Offices of "The Aeroplane" are at 175, Piccadilly, London, W.1.
Telegraphic Address: "Aileron, London." Telephone: Gerrard, 5407.

Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Street, London, W.C.2.

Subscription Rates, post free: Home, 3 months, 7s 6d.; 6 months, 15s.; 12 months 30s. Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8. U.S.A., 1 Year, $8 50c.

ON OUR INLAND AERIAL POSTS.

It has always been a kind of article of faith with the population of this country that the British Post Office is the most wonderful institution of its kind in the world. People have always believed that anything committed to the care of the Postal Authorities was as safe as if it were in the Bank of England, and that any letter was always sure to be delivered—even if it took ten years to deliver it. And to a very great extent this faith has been justified. The non-delivery of a letter or parcel in the British Isles is one of the most unusual of Nature's phenomena.

But the Post Office is not fond of new-fangled ideas, and its methods are slow and circuitous. For example, it was years before it adopted motor transport for mails—in which delay perhaps it was justified when one remembers the early motor vans which the Post Office was badgered by the motor trade to adopt. Also, the Post Office took over a very fairly efficient telephone system from a private company and made it one of the slowest and least efficient services of its kind, though, it must be admitted, a reasonably sure means of communication provided that the user is possessed of adequate patience.

Therefore, taking the history of the Post Office into consideration, it was not reasonable to expect that it would leap enthusiastically at the aeroplane as a means of conveyance in normal times. Nevertheless, when in an abnormal time such as the present, the Post Office was obliged by force of circumstances to countenance the use of aeroplanes, the aforesaid history of the department did at least justify one in hoping that reasonable commonsense would be used in organising the new service.

An Inexplicable Muddle.

Just what has happened to the Post Office is not very clear at the moment. So far as one knows, it has not invited the assistance of the Committee of the Royal Aero Club in laying down the rules and regulations for the Aerial Post: and it seems that the Department of Civil Aviation has had very little to do with the affair beyond allowing the use of aerodromes and sending a few machines and calling a meeting of people in the Aircraft Industry to discuss the Post Office proposals. Therefore there seems no obvious reason for the amazing imbecility with which the whole affair has been mismanaged.

It would be interesting for the sake of historical record to know the name of the official who laid down the regulation that the fee for letters by the aerial mail should be 2s. an ounce. It would be equally interesting to know the name of the official who thought of the brilliant idea of "hiring"—which really means commandeering—all available civilian aeroplanes for postal work. For the net effect of the work of these two great geniuses was to stop the sending of letters by aerial post and to stop civil aerial transport. From which it has followed that during the past week the sky has been full of aeroplanes, burning vast quantities of petrol and carrying nothing and nobody—except their very bored pilots.

To make matters worse, having thus succeeded in disorganising civilian aerial transport, the Post Office, after two days, cancelled all the mail-carrying by civilian transport firms, and transferred its mails to the care of the R.A.F. This may, perhaps, have assured greater reliability so far as reliability was concerned, though one doubts it, but it certainly interfered with the first steps of a struggling industry towards developing a new and paying form of activity. On the other hand, it gave the R.A.F. a job of work to do, and made a number of young gentlemen supremely happy after months of idleness.

And then to crown it all the Post Office stopped sending mails by the R.A.F. after four days.

Freaks and Figures.

Take a record of the opening day, as shown in the Civil Aerial Transport Notes this week. It has been stated by the "Morning Post," writing presumably with authority, that 315 letters were carried, though there was fuselage capacity for 4,750 lbs.

Allowing that the 315 letters each weighed the statutory ounce, the total weight of letters carried would be just under 20 lb. Therefore carrying capacity for 4,730 lb. was wasted. That means, roughly, that 34 passengers were prevented from travelling.

One does not imagine that 34 passengers arrived at the various aerodromes and danced with rage when burly postmen prevented them by physical force from getting into the machines. But if only ten people who wished to travel on urgent business were refused seats at the various booking-offices it means that considerable harm has been done to civil aviation, and very probably to the trade of the country. On the other hand, it might very well prove that the bulk of the total load of 19 lb. 11 oz. of letters consisted of quite unnecessary communications sent by people who were willing to spend a couple of shillings for the fun of having a sample of the earliest official aerial mail.

When one comes to consider some of the details now available one scarcely knows whether to laugh or cry over these puerile attempts at running a mail service.

For example, a Westland Limousine carried 1 lb. 1 oz. (not forgetting the one ounce) of letters from Hounslow to Bristol. Just imagine sending a Rolls-Royce engine and a pilot (and accommodation for three passengers) 120 miles to carry 1 lb. 1 oz.! And remember that the machine had to fly from Yeovil to Hounslow in the first place in order to pick up its "load."

Then we learn that a Blackburn Kangaroo (two Rolls-Royces of 375 h.p. each) flew from Hounslow to Newcastle with 3 lb. 8 oz. You perceive the wisdom of the Postal Authorities in choosing a twin-engined machine for the extra load, which—if you have a slight knowledge of arithmetic—you may prove is more than three times as great as that carried by the Westland.

This problem must have presented considerable difficulty. If the load for Newcastle had been 4 lb. 4 oz. obviously there would have been a grave risk in committing it to the care of anything less than a four-engined Handley Page.

However, apparently experience teaches even the officials of the Post Office, for one learns that the Newcastle machine left at 7.50 a.m., and at 8 a.m. another Kangaroo left for Renfrew carrying 13 lb. 10 oz. of mails. One is aghast at this official recklessness. One can only assume that, having seen the Newcastle machine lift its load with apparent ease, the officials felt justified in taking the risk.

Or perhaps by that time some of the officials of the Department of Civil Aviation had arrived—doubtless greatly inconvenienced by being thus compelled to be out in the middle of the night (as it would be, judging by former Air Ministry hours)—and had proved to the Post Office authorities that such a load was safe. One official department is always ready to accept the figures of another, even though the mere civilian may know perfectly well that the figures are either foolish or faked.

Anyhow, this success in lifting 13 lb. 8 oz. with only two engines—where, judging by the first postal effort with the Westland machine, thirteen and a half engines at least would have been necessary—the Authorities were spurred to still further recklessness. They actually allowed a B.A.T. commercial machine with only one engine to leave for Didsbury carrying 6 lb. 2 oz. of mails.

Truly "Education is a great thing!" as an Irish servant once remarked when her mistress demonstrated to her that she could write her name with her finger in the dust on top of the piano. At this rate of progress we may find aeroplanes carrying a full load of mails in the course of the next century.

Profits and Losses.

It is stated by the "Daily Mail" that a Post Office official said: "The charge is very little more than that for a telegram, and the service does not meet its cost, nor is it expected to do so." Apart from the fact that this is a very damning statement for an official to make in these days when the official scream is all for economy, why send a letter by aerial post if it costs more than a telegram?

But is the service not expected to meet its cost? One has one's doubts. If the machines carried their full load the service would not merely pay. It would afford a clear case for a charge of profiteering against the Government. For consider the case of any ordinary single-engined machine which is quite able to carry a load of 700 lb.

Now 700 lbs. is equal to 11,200 ounces, and at 2s. per ounce this is equal to £1,120. One gathers that the Post Office hires these machines at about £100 per trip, which leaves £1,020 for other expenses and profit. If one allows £20 for the motor services to and from the terminal aerodromes, the Post Office would show a clear profit of about £1,000 on an outlay of £120, which is at the rate of about eight hundred and fifty per cent.

A Paying Proposition.

If the Post Office authorities had exercised a little common sense they could quite easily have made the Aerial Post pay its way and have made it a real benefit to the community. Instead of prohibiting the sending of aerial letters by charging 2s. an ounce, and limiting the places at which such letters can be posted to three post-offices in positions which are not frequented by people who are likely to want to send letters by air, the charge should have been 6d. per ounce, and it should have been permissible to post such letters anywhere.

Naturally it will be objected that such a course would mean extra sorting. In theory it would. In practice it would not. For every letter bearing a 6d. stamp and marked clearly "Air Mail" by the sender would merely go straight into the air mail section, and the extra sorting would be no more than if several thousands of people suddenly took to writing daily to Auchtermuchtie or Kiltimagh.

The Air Mail letters would merely represent another place on the map, so far as the G.P.O. was concerned, and the sorting of the Air Mail letters themselves has to be done in any case, whether the postal aeroplanes carry 315 letters in the day or 315,000 letters. In fact, the cost per letter of sorting 315 letters must be enormous, whereas the cost of sorting big numbers is very small when charged to each letter proportionately.

As concerns the sixpenny stamp, one would argue that such a low fee would induce thousands of people to send letters by air posts who would not pay 2s. an ounce. Thus the postal aeroplanes would be assured of a full load for every journey.

Now 700 lb. of letters at 6d. per oz. is equal to £280 per load. And as the machines cost, as aforesaid, £100 per trip for hire, the Post Office would still have £180 for incidental expenses, and so might very well run the service at a profit.

Perhaps the Postal Authorities will be good enough to consider this suggestion in the interests of economy and of the taxpayers' pockets. While they worked the inland aerial posts merely wasted petrol and money and were of no use at all to anybody who matters. The only good thing about them was that they provided the aeroplane and engine makers with good material for advertisements. Of which material, by the way, few have made the best possible use.

The Air Ministry's Eccentricities.

As one might have expected, the Air Ministry's share in the proceedings was calculated to make matters worse. Presumably the Post Office was indifferent as to whence the letters went, though it would have a slight bias in favour of the most accessible aerodromes. Consequently the Air Ministry chose to send the mails from Hounslow, which involved a long drive from the G.P.O. through the thickest of London traffic, and through that awful traffic jamb at Brentford, which always means delay.

The obviously sensible thing to do was to send the mails from Hendon or Cricklewood, either of which are miles nearer to the G.P.O. than is Hounslow, and either of which can be reached by either of two roads (the Edgware Road and the Finchley Road), both of which are singularly open and free from heavy traffic. The mails could get to either aerodrome in less than half the time it took for them to reach Hounslow. And, moreover, both Hendon and Cricklewood are actually on the way to the great cities in the North whither go the greater portion of the mails, whereas Hounslow is quite out of the way and involves a longer air journey.

All of which is quite in keeping with the methods of the Department of Civil Aviation, which for some incomprehensible reason seems to be obsessed by a love for the Wilderness of Hounslow, only rivalled by its affection for the death-trap at Kenley.

An Irish Economy.

Apropos the Air Ministry's vagaries, one hears that it has been preparing to run an official aeroplane service of Bristol Fighters from Holyhead to Dublin. Now everybody knows that the Bristol Fighter is one of the finest aeroplanes in the World. But why, in the name of common sense, run a land-machine service over 60 miles of sea? What are our flying-boats and sea-planes doing? It must take over half an hour at least

THE AERIAL MAIL.—Loading the London-Paris mail into the Airco D.H.16 machine at Hounslow.

to cross that 60 miles of water, and if there is a head wind the time must go up to three-quarters of an hour. Baldonnel, the Dublin landing-ground, is, like all the other official aerodromes, ten miles on the *wrong* side of the city which it is supposed to serve. And that means another three-quarters of an hour to get the mails back into Dublin.

Thus the time from Holyhead to Dublin is something over an hour and a half. And all the time there is a perfectly good and regular mail-boat service between the two places which takes three hours. So that to save a very problematic hour and a half the Air Ministry apparently proposes to risk a number of valuable lives and machines by sending land machines over the sea.

In any case, if there is any violent hurry with specially urgent official dispatches a flying-boat could get off smooth water in Holyhead Harbour and alight in smooth water at Kingstown or in the mouth of the Liffey and save all the land journey from Baldonnel to Dublin. But that, of course, is far too simple a proposition to appeal to the Air Ministry, at any rate on either its Civil Aviation or its Naval side.

The Benefit to the R.A.F.

On the other hand the purely Military side of the R.A.F. seems to have done, as usual, extraordinarily well. One may not, of course, go into details concerning its organisation for the distribution of special dispatches from Government Departments to the Provinces, but one can vouch for the fact that it has been excellently done. The regularity and speed with which dispatches have been taken and replies brought back has surprised and pleased even the most stolid and unbelieving of officials.

Also one gathers that certain patrol-work which has been done by the R.A.F. along the railways has had considerable moral effect on the lower-class railwaymen and has definitely restrained acts of sabotage. So that, despite all the silliness and muddle-headedness of the Post Office people and of the Civil Aviation authorities, aviation in general and the R.A.F. in particular have profited by the strike.

Economy and Prohibition.

Yet another minor eccentricity is concerned with a kind of local aerial mail which, one is told, is being run in the Liverpool area. There are, it will be recalled, certain of those sacred "prohibited areas" in the Mersey Defence district, and though the postal aeroplanes are piloted by R.A.F. officers, or by ex-R.A.F. officers, they are compelled to make a detour of an extra 15 miles to avoid these areas.

And this is done at a time when urgent appeals are being made to all motorists to economise every drop of petrol. Truly our officials are a race apart. Perhaps "Mr. Pussyfoot" might give them some good advice on the subject of the inordinate consumption of spirit.

The Uses of Official Muddles.

It will be interesting to see how all this muddle is straightened out in course of time. Though the strike appears to be broken, we are still a long way from Industrial Peace, and though perhaps the use of aerial mails may have ceased by the time these notes appear, doubtless they will be revived at the next crisis.

Our officials do actually learn sense if one gives them time, and especially if they are criticised with sufficient causticity. One has done one's little best in this direction, and so one hopes that the points raised in this article may help towards economy and efficiency in the future of aerial mail-carrying.—C. G. G.

THE AERIAL MAIL.—Taking mails aboard the Handley Page London-Brussels aeroplane. The aeroplane carried 1,500 lb. of official mail to Brussels on Sept. 29th. The same machine returned on the following day with a pilot, mechanics, two passengers, and 1,940 lb. of mail. It also carried a 2½-year-old baby. Apparently machines flying to the Continent can carry much more than those used at home!

NAVAL & MILITARY AERONAUTICS

[The "Official Gazette" Notices and the Personal Notices will be found on p. 1350.]

GREAT BRITAIN.

MILITARY.

THE CASUALTY LIST.

Reported Oct. 4th.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Phillippo, Lt. A. J. C., R.A.S.C., attd. R.F.C
Ottey, Sec. Lt. R. G., R.F.C.
Samuels, Sec. Lt. G. B., Durh. L.I., attd. R.F.C.
Smith, Capt. A. H., M.C., R.F.C.

AIR FORCE.

SEARCHLIGHTS FOR AERODROMES.

The Air Ministry announced on Oct. 6th that as a temporary and emergency measure to assist belated aircraft to locate their aerodromes after dusk the Air Ministry has arranged for vertical searchlight beams to be projected from the following aerodromes about dusk till all service machines have arrived :—

Hounslow, one vertical beam.
Kenley, two vertical beams.
Limpne, three vertical beams, arranged in a triangle.

AN AERODROME FIRE.

A fire occurred on Oct. 2nd at Shotwick Aerodrome, near Chester. At about seven o'clock a hangar was observed to be on fire. The promptitude of two local fire brigades prevented the fire from spreading, but the hangar was burned out, and a number of aeroplanes destroyed. The cause of the fire is unknown.

Shotwick Aerodrome is an important R.A.F. Air Station, and is also a civilian flying ground.

A FORCED LANDING.

A message from St. Raphael, dated Sept. 30th, states that an S.E. biplane, No. 246, piloted by Capt. L. Edward, R.A.F., was forced to land near Sillans-la-Caseade, near Dragnuignan. The machine was on its way from London to Egypt, via St. Raphael.

THE FREEDOM OF THE CITY.

Major C. Scott, R.A.F., the commander of H.M.A. R.34, received the freedom of the city of Dunbar in recognition of the flight of R.34 across the Atlantic.

THE RESULT OF AN ACCIDENT.

Serjeant Thomas Bunting, R.A.F., has died from burns caused by the explosion of an R.A.F. motor-launch moored in Poole Harbour, which was reported last week.

FRANCE.

On Oct. 3rd a reception was held at the Aero Club de France in honour of Commandant Vuillemin who has recently concluded his aerial tour from Paris to Cairo and back. The reunion was presided over by H.I.H. Prince Roland Bonaparte the Comte de la Vaulx, and General Duval.

GERMANY.

The Allied Supreme Council met on Sept. 29th in Paris to discuss the question of how to prevent the Germans from selling or exporting their aircraft material contrary to the order of the Allied and Associated Powers. A resolution on the subject proposed by Marshal Foch was considered and accepted.

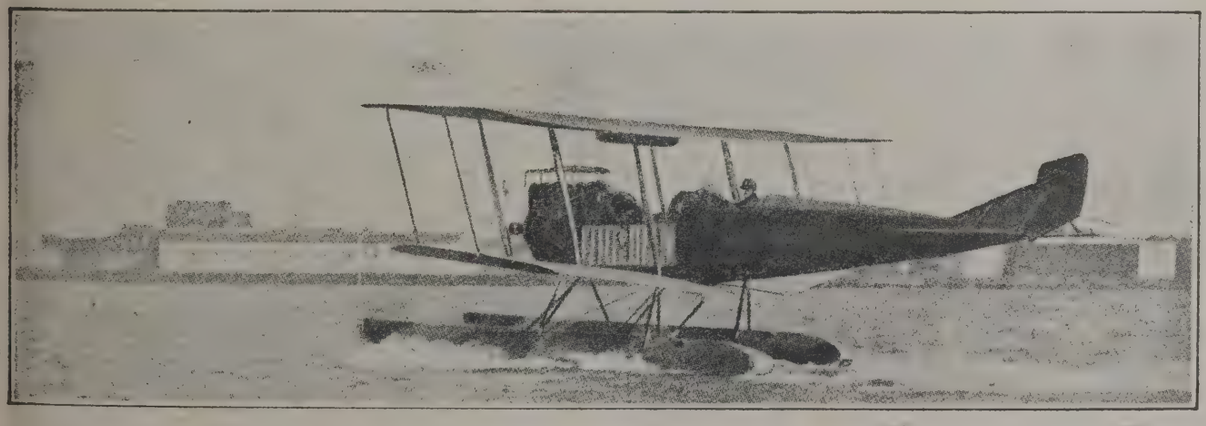
It was also decided to insist on the Germans surrendering the sums they have already received by the sale of aircraft material without the sanction of the Allied and Associated Powers. The question of the distribution of German aircraft among the Allied and Associated Powers was discussed, and the report of the military representatives was accepted.

On Oct. 3rd the following appeared in the "Intransigeant," of Paris, concerning the adoption by the Supreme Council of the report of the Inter-Allied Commission of aircraft material :

"According to the programme which was decided upon for the sharing out of the Zeppelins, France will have the first choice, then Great Britain, and then the United States. After this choice has been made the remaining Zeppelins will be destroyed. The different Powers will also have the right to choose various makes of German aeroplanes, Belgium, Greece, Roumania, and Serbia also taking part in this partition.

"No official confirmation of the destruction of Zeppelins by the Germans has been received, but it is known to the French authorities that German officers attached to the airship service are destroying all vessels the existence of which was not formerly known to the Allies

"According to the terms of the Peace Treaty, the manufacture of German machines must cease six months after the ratification of the Treaty by the Powers. A factory at Dusseldorf is at present engaged in constructing a giant type of Zeppelin. The work is being hurried forward in order that it may be finished before the ratification of the treaty."



HOLLAND.

Capt. Hardenburg, of the Royal Dutch Army, commanding certain aviation units in the Netherlands, and Lieut. Labouchère, Military Attaché at the Dutch Legation in Paris, are visiting aeronautical factories and aerodromes, both civil and military, in order to draft a report on the development of French aviation during the war. Lieut. de Fleurieu, of the Headquarters Staff of the Military Aviation Arm of the French Army, has been detailed to conduct these officers on their tour.

ITALY.

The following news has been communicated by the Italian correspondent of THE AEROPLANE :—

In consequence of the Fiume affair, all flying has been stopped. As on the occasion of the general strike when terrestrial vehicles were put out of action by that means, the magneto or commutator has been removed from all aero en-

IN WAR TIME.—A German D.F.W. Seaplane. This type was used at Lübeck during the war for training purposes.

gines. Even the newspaper, Milan-Rome, carriers and the Sardinian inland mail have been stopped.

In spite of this, the Naval "Ace" and Gold Medallist, Casagrande, succeeded recently in getting away from Pola with three seaplanes and several officer pilots and mechanics to Fiume, where D'Annunzio, who was just back from the Grobnitro aerodrome, welcomed them effusively. Later in the day two Samls and three SVAs from Trento joined the patriotic Aero Forces. There are thus some score of first-class pilots with their 'buses at Fiume.

Evidently, as might have been expected, D'Annunzio counted upon his fellows for news, money and other aid, and he appears to be using aeroplanes for sending news out of Fiume. There is an aerodrome there, of course.—T. S. H.

A report from Spalato states that on Sept. 22nd an Italian aviator, presumably from Fiume, dropped proclamations issued by D'Annunzio over Zara. These stated that D'Annunzio would occupy Spalato and Dalmatia as far as Cattaro as soon as he had sufficient forces.

JAPAN.

The Japanese Army has purchased some hundred or so aeroplanes from the French Government through that country's aeronautical mission.

An aviation school has been established at Tokorozawa, near Tokyo, and several others are being established. Maurice Farman pusher machines are used for elementary and Sopwiths for advanced training.

The Navy has also bought a large number of seaplanes, of which Maurice Farman (for training), Short, Sopwith, Salmson, Deperdussin, Nieuport, and Curtiss are to be the principal types.

SWEDEN.

The Danish correspondent of THE AEROPLANE writes :—

A paper on psychologic flying tests was read on Sept. 17th in Stockholm by Oberlehrer Rudolf Schulze, chief of the institute in Leipzig for experimental pedagogy and psychology. The lecture was attended by General Uggla on behalf of the King, further by the War Minister Nilson, some professors, and a number of flying officers.

The lecture was financially supported by the Government and the Swedish Air Traffic Co. Herr Schulze mentioned first the tests applicants were subjected to at big German concerns like the A.E.G. and the Berlin trams, and next treated the various apparatus and means of testing the various senses and the individual reactions of candidates, suggesting as a good scheme that pilots should work out for themselves difficult imagined positions and how they would behave then.

SPAIN.

The Spanish Government has considerably increased the establishment of its Flying Services by the recent addition of some 40 French aeroplanes and about 20 British.

U.S.A.

A PIONEER HONOURED.

To be Honorary Companion of the Distinguished Service Order :—

Lieut.-Col. John Armstrong Drexel, United States Signal Service, Washington (formerly attached to the Air Ministry, London).

J. Armstrong Drexel will be remembered by his flying at the first Bournemouth flying meeting and elsewhere, having taken his Royal Aero Club certificate No. 14 on a Blériot monoplane at Beaulieu, Hants, on June 21st, 1910.

He subsequently set up a British altitude record of 6,595 ft. for aviator alone, on a Blériot monoplane at the Lanark meeting in August, 1910.

THE HOUSE OF BOLO.

By G. L. DORE.

Before May 1st, 1919, there were many officers in the House of Bolo dealing with matters aeronautical; they all had great acting rank and much pay, and sat in comfortable chairs before large desks, smoking cigarettes and talking to their pals or lady clerks.

These ladies, who appeared to be mostly chosen for their good looks, also drew much pay, which they spent on gorgeous raiment to please the eyes of the officers.

On the desks of the officers were many tin trays, on which were stuck labels bearing mystic words, such as "In," "Out," "Pending," "Action," and "Speak," and from time to time very small messengers would enter and place papers in the tray marked "In," then the officer would glance at the papers and put them into another tray where they would stay for perhaps a week or perhaps longer before they were moved into another tray.

Very few of those officers had been up in an aeroplane, and it was rumoured that some had never even seen one, but theirs was the task of running departments in Bolo House.

There were others who had seen Service flying in France, but they were few, and there were some who arrived before 11.0 a.m. in the morning, and who did not take two and a-half hours for lunch, and leave for home at 5.0 p.m.; but they were not many.

However, Bolo House continued to flourish, and new hotels and buildings were taken over frequently to house the staff, which continually increased.

There were many departments in Bolo House, and they all had their little failings. "Records," which should have known everything about everybody, knew very little about anybody, and would answer nearly all queries by, "We have no trace of this," or, more shortly, "No trace," and any information which they did give could hardly be relied upon.

"Casualties" occasionally killed the wrong people, which was disturbing.

"The Printing Section" gave great promises which led to bitter disappointments.

"Airships" were the most feared people; they all had great rank and looked very naval; they had splendid offices overlooking the Thames, which they never entered; but so greatly were they respected that no one dared to enter their offices even to win a waste-paper basket or a tin tray.

"Permanent Commissions" had a large staff who spent their days sorting files; many conferences were attended, and yet nothing could be decided, and no one obtained a Permanent Commission in the R.A.F.

There were many other departments also; some did great things and some nothing, but all lived very happily then.

On the First of May, 1919, there was much distress, for all officers who held acting rank had to relinquish it, and all the generals became colonels, and all the majors became lieutenants, which pleased them not at all.

On the next day nearly all the officers were demobilised, despite their protests that Bolo House could not progress without them, and now they are wandering in the streets seeking work and finding none.

The **SIDDELEY** AIRCRAFT ENGINE

The Folkestone to Cologne Air Mail

THE Aerial Mail Service from Folkestone to Cologne (recently discontinued) was carried out by two squadrons of the Royal Air Force, one of which was equipped with D.H.9 aeroplanes fitted with 230 h.p. Siddeley Aircraft Engines. The journey was performed in an average of 3 hours 22 minutes. The average weight of mail carried per journey was over 160 pounds.

That the service was efficient is proved by the fact that during the week ended August 16th over 7,000 pounds of postal matter was safely carried from this country to the troops in Germany. Of 45 journeys commenced only one was not completed.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

A Royal Flight.

On Oct. 3rd H.M. the King of the Belgians, who is at present on a visit to the United States of America, flew over the City of New York in a seaplane.

The Royal Aero Club Seaplane Competition.

On account of the Railway Strike, the Committee of the Royal Aero Club, at its meeting on Oct. 1st, 1919, decided to postpone the Seaplane Competition proposed to be held at the end of this month.

It would be interesting to know in what way a seaplane competition is influenced by a railway strike. One would have supposed that the occasion would afford an excellent opportunity of demonstrating conclusively that aircraft are not in any way dependent on railways or the vagaries of railway personnel. This cancellation would appear to prove once and for all the unfitness of the Committee of the Royal Aero Club either to organise or control the sport of flying in this country.

Readers are referred particularly to the Aero Club's official notices this week.—C. G. G.

The Professorship of Aeronautics.

Some further particulars are now available concerning Capt. Bennett Melvill Jones who was recently appointed Professor of Aeronautics at Cambridge. One is indebted to the "Liverpool Courier" for the following :—

Mr. Bennett Melvill Jones, whose appointment as Professor of Aeronautics at Cambridge has been announced, is a son of Mr. Benedict Jones, formerly of Birkenhead, now residing at Megavissey, in Cornwall.

He was educated at Birkenhead School, and in 1906 took an Exhibition for Mathematics at Emmanuel College, Cambridge, where later he became a scholar, graduating in First Class in 1909 in the Mechanical Sciences Tripos. A year later he was a shop student at Woolwich Arsenal, afterwards proceeding to the National Physical Laboratory at Teddington, where he was engaged in aeronautical research until May, 1913.

During this period, in conjunction with Dr. L. Bairstow, he carried out experiments on aeroplanes which were far in advance of anything then known, and established many principles which were quite new, but are now the foundation of aeronautics. He constructed a wind channel and aeronautical balance, which are now standard experimental instruments, and conducted many other researches. . . . . .

A Lieutenant in the London Territorials (Royal Engineers), when war broke out, he volunteered for foreign service, and was in camp for a month, when he was then sent to the Royal Aircraft Factory at Farnborough, and until May 1916, was in charge of many departments of research. In 1916, when the Government gave the late Colonel Professor Hopkinson a free hand to start an experimental station at Orfordness and to choose his own assistants, his first selection was Mr. Jones, who then carried out numerous and important experiments on aeronautical gunnery, gun sights, bombing, navigation and night-flying, which had most important results on the war. In order to observe the actual practice in war, Mr. Jones went several times to France and took part in actual air fighting. On one of these expeditions he was piloted by his younger brother, Mr. B. H. Ll. Jones, who was one of the most skilful of pilots, but has since been killed.

In July last year Mr. Bennett Jones was removed to London with the rank of Lieut.-Colonel, and became one of the Assistant Controllers of the Technical Department of the R.A.F.

He has obtained the Air Force Cross, and has been several times "mentioned."

An Air Lifeboat.

On Saturday, 4th inst., a very heavy mist came over Hounslow, and cross-country flights became impossible. So the Avros turned their attention to salvage operations.

Before dawn the drone of twin-engines was heard through the murk. The noise wandered uneasily to and fro, and it became evident that some large aeroplane was completely lost. Signals were made from the aerodrome without result; so at last an Avro was asked to perform the function of an aerial life-boat. It went up and groped about in the dark in the direction of the noise, and presently made out a large machine with 10 passengers aboard roaming unhappily round with a "four a.m. and I can't find the keyhole" air.

The Avro pilot had to go cautiously, for when he began to fly towards the liner he lost sight of the aerodrome. However, he fired Verey lights and presently attracted the attention of the liner and directed it safely to earth. It had taken an hour and a half to get to Hounslow from another London aerodrome.

Again, after dark that night, an Avro had to go up to show the way to a second large machine which had lost its bearings. (R.N.L.I., please note.)

One of the Blackburn "Kangaroos" getting off at the E.L. T.A. Show. The B.A.T. Shed is the first from the right, and the bigger Sheds housed the Vickers "Vimy" and the Handley Page machines.

The WORLD of AERONAUTICS (continued)

The Work of an Aerial Customs Office.

Every commercial aeroplane entering or leaving the country must be reported to the Officer in Charge of His Majesty's Customs and Excise at Hounslow Aerodrome. Its pilot must declare the nature of the goods carried. The organisation is now in full working order and it is the boast of the Excise Officer that no pilot leaves the country without carrying with him all information that the Customs officer at the destination aerodrome may wish to know.

Difficulties were encountered when the branch was first opened, but they are being adjusted by experience. Now there is very little delay or inconvenience, either to pilots or passengers. If an incoming machine is forced to land at another aerodrome for petrol or any other reason, the local Customs officer has to report the affair to Hounslow, and takes steps to see that none interferes with the cargo.

The railway strike practically doubled the work at Hounslow. The official records showed that 111 machines had left for the Continent and 81 had arrived up to midday, Sept. 30th.

Before the strike began the average of departures from Hounslow was three aeroplanes a day. On Monday, Sept. 29th, there were eight departures. Three machines arrived on that date and six on Sept. 30th.

The value of the cargoes varies enormously. On Sept. 30th the value of a small piece of jewellery from Paris was declared at £400. The Customs officer on his inspection is usually accompanied by a representative of the company which owns the aeroplane.

Fairy Tales.

On the return of the American Air Mission to the United States from Europe after an extensive study of European air establishments, Assistant Secretary of War Crowell made the following statement:—

"Great Britain has come to consider the dominance of the air as at least of equal importance with that of the seas, and is frankly and avowedly planning a definite policy of aerial development to that end."

Having seen and heard something of what Great Britain is doing towards the dominance of the air we can only repeat that well-known and much-used expression: "Thank God we have got a Navy."

From Aeroplanes to Poultry Runs.

One hears of aeroplane constructors turning their attention to the manufacture of many articles from wheel-barrows to window-sashes and from perambulators to poultry runs. Motor-cycles, motor-car bodies, all kinds of furniture, rowing-boats, and dozens of other articles are being made by firms that were during the war busy on the work of turning out Service and training machines. One naturally feels it wrong that the skilled employees of the great firms should have to turn their abilities to the production of comparatively mundane articles; but, at the same time, one feels that the firms that are making great efforts to find any sort of work that will keep their workpeople employed are acting in the right spirit. When the boom in commercial aviation does come they will be in a position to take advantage of it. It would be a thousand pities to see most of the skilled aircraft workers disbanded and absorbed by other industries, for it would be a matter of some difficulty to bring them together when wanted.

208 Squadron.

With reference to the notice of the 208th Squadron Dinner, would-be diners are requested to note that this dinner is postponed indefinitely, owing to the railway strike. Those who wish to attend the dinner when it does take place are asked to communicate with H. A. Zinn, Flying Officer and Adjutant, No. 208 Squadron, Royal Air Force, Netheravon, Wilts.

The S.M.M.T. Olympia Show.

The Society of Motor Manufacturers and Traders, Ltd., wish to state that there is no foundation whatever in any rumour that their November Motor Show at Olympia will be either postponed or abandoned.

Petrol Supplies.

There are adequate stocks of motor spirit in the country to meet *all* requirements. In the continued difficulties of railway transport the trouble is to get the motor spirit into the hands of those who need it for food distribution and other essential national needs. The companies which distribute petrol are confident that this can be done with the co-operation of the public and the trade.

Distribution by motor transport to garages, etc., must be discontinued, all such transport being required for other purposes. Dealers and commercial consumers requiring motor spirit must therefore call at the local depots of the distributing companies and bring with them all empty packages available, as supplies of full packages will be limited to the number of empties returned.

The hoarding of motor spirit or the use of it by those who do not really require it during railway difficulties is contrary to the public interest. The distributing companies much regret the inconvenience caused, which they hope will not be of long duration.

Excess of Zeal.

Martinsydes, Ltd., and Mr. A. Trott were summoned before the Woking magistrates on Sept. 27th in respect of dealing in mutton by retail without a registration certificate, and also for supplying meat contrary to the Rationing Order on or about Aug. 29th.

Mr. Symes said he was prepared to plead guilty to the summonses. Martinsydes had a farm, and reared a number of sheep. These were killed off in time, the meat being brought to Woking and sold to the employees at ordinary prices.

The firm were under the impression that they were entitled to give their own men preference. They were misled by inspired articles asking people to keep pigs, rabbits, etc. The works canteen catered for 2,000 men, and was started under the Welfare scheme.

The firm tendered their sincere regret to the Local Food Control Committee that such an offence should have occurred. Mr. Symes hoped that the Bench would take a lenient view of the occurrence. If convicted the firm would be barred from being represented on the Food Control Committee.

The Bench dismissed the whole of the summons upon payment of costs, and Mr. Symes expressed his thanks to them.

Those who protest against the proposed scheme to hunt Caribou by aeroplane may regard with greater favour the method of giraffe-hunting by aeroplane as suggested by the German paper "Luftpost."

The Ruling Factor

The Historic reputation of the
Beardmore Aero Engine
results from its all-round superiority

This has been proved up to the hilt in record after record previous to the War—and by its own particular characteristics boldly shown during the War. The History of the Beardmore is not based on "meteoric stunts" but on sound service in every case. This service has always been available from the Beardmore—is now—and always will be available under the most exacting phases in Aviation.

These claims are not "mere rhetoric" but are proved by the fact that to-day a large number of leading Aircraft Manufacturers are adopting the

Beardmore Aero Engine
As Standard Post-War Power Unit.

This Beardmore qualification permits its claim of being the best Engine for Commercial Transport in the Air.

BEARDMORE AERO ENGINE, LTD.
112, GREAT PORTLAND STREET - - LONDON, W.I.
Works: Parkhead Works, Glasgow.

A BOON TO COMMERCIAL FLYING.

One of the surest signs of the stability of a new industry is given when one finds business men of proved ability and business firms of high standing launching out in a big way in that new industry. There has always been a suspicion at the back of the mind of everybody concerned with aircraft, that the interest taken by the big armament firms in aircraft merely indicated that firms of that class, knowing that there was a war coming, began to take an interest in aircraft in the early days so as to be in the market with war aircraft when the war came.

It is, therefore, satisfactory to find that some big armament firms so far from dropping their interest in aircraft are actually tending to take a keen interest in the development of commercial aeronautics.

Among the firms which have done much for aircraft during the war, one may certainly place the firm of Sir Wm. Beardmore and Co., Ltd. Apart from the fact that the firm has built a very large number of excellent aeroplanes, the firm deserves particularly to go down to history as having provided our Flying Services with one of the most satisfactory and thoroughly reliable aero-engines that has ever been constructed; and, incidentally, one of the first aero-engines produced in this country.

The immense foresight of Sir William Beardmore, Bart., chief of the firm, was shown when he purchased the British rights of the Austro-Daimler engine some two years before the war. Those most competent to judge held, then, that the Austro-Daimler was certainly one of the very finest aero-engines in the world, although, at the time, the ultra-light air-cooled engines threatened to displace water-cooled engines for all purposes.

In spite of this, Sir Wm. Beardmore gambled on the Austro-Daimler. When the designs reached the Beardmore works result was the 120 h.p. Beardmore, which was just coming into its own when war began. It was an eminently reliable engine, but was a trifle heavy for its power. Naturally, the Beardmore people proceeded to improve it, and during the first year of war produced the 160 h.p. Beardmore, which was one of the very few engines produced in 1915, and still in use at the end of the war. In fact, to-day there are many excellent war pilots who hold that as a machine, which is guaranteed to get its crew from one place to another without fail in any weather, the old Beardmore-engined Armstrong-Whitworth is still in the very first rank. Lieut.-Col. G. L. P. Henderson's recent tour to the Riviera and back in 21½ hours' travelling time is a proof of the statement and of the fact.

With such a record as producers of engines, it is not surprising that the Beardmore firm should base its first move in commercial aeronautics on the reliability and popularity of the 160-h.p. Beardmore engine. The immediate future policy of the firm is one which, when one comes to consider it carefully, is of the soundest and at the same time one of the most useful moves for the benefit of commercial aeronautics that can possibly be made.

As Mr. Luther, who, as is well known, has handled Beardmore aero-engines from their beginning, pointed out to the writer recently, in the present state of civil aviation the question of cost in relation to work done has to be considered far more seriously than has been the case during the past four years, or in fact during any period in the history of aviation, for we are now past both the experimental stage and the "power-at-any-price" stage, and have to settle down to plain business propositions.

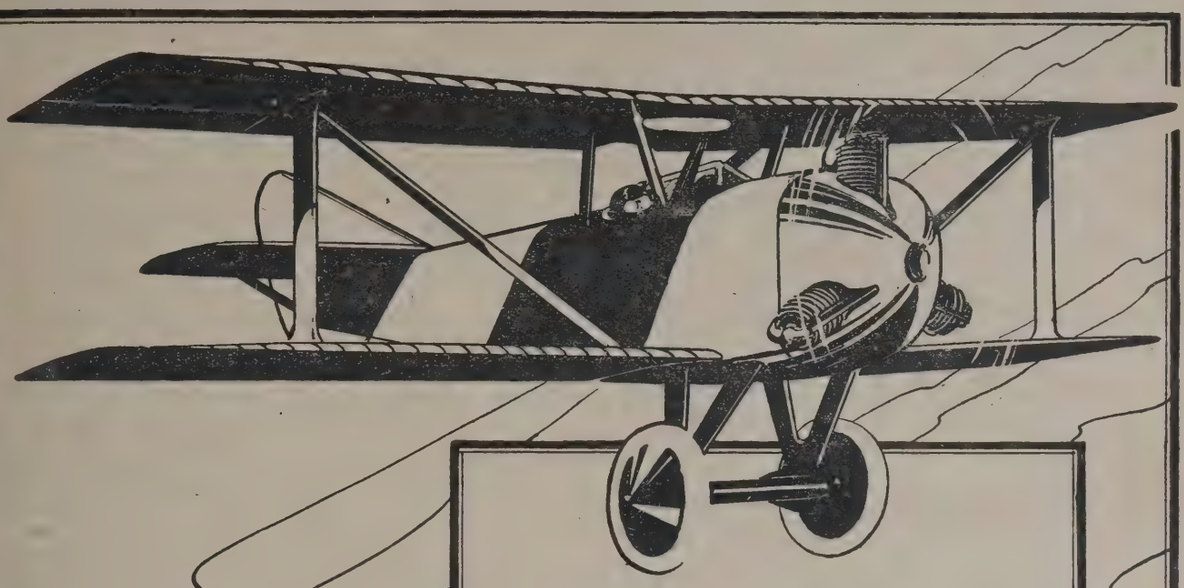
The Beardmore people are convinced that this must be realised by all practical men who have an opportunity of observing the amount of service obtained from engines designed exclusively for war purposes in relation to their cost. Also this must be taken in relation with the influence that the war will have upon future production costs.

Now the number of Beardmore engines and parts thereof at present existing represent an enormous amount, both in cash and in potential value, to commercial aeronautics, and this value cannot be adequately used unless it is collected and handled in a manner which will give the aeroplane manufacturers the best possible service. It is equally important that behind the potential value of these engines there should be an organisation of experience and resource, both material and financial, upon which manufacturers can rely.

The scheme of the Beardmore Company therefore is more or less as follows:—The Company has purchased every 160-h.p. and 120-h.p. Beardmore engine in the possession of the Government, and also all the spare parts available for those engines. The engines will be taken to the firm's works at Parkhead, where they will be dismantled, thoroughly examined and improved in certain details where war experience has shown slight alterations to be desirable. The engines will then be rebuilt, and each one will be given a thorough power and endurance test, after which it will be offered for sale to aeroplane manufacturers with a first-class guarantee, and at a price which cannot be touched by any engine of similar power built under present-day industrial conditions.

Under this scheme aeroplane manufacturers will be enabled to put on the market thoroughly reliable passenger-carrying aeroplanes to the number of, at any rate, some thousands, at a price which will make commercial aviation a business proposition. The reliability of the engine is bound to increase public belief in the reliability of aircraft in general, and so the foundations may be laid for bigger business in more expensive aeroplanes and engines in time to come.

When one discloses the fact that this deal with the Government runs into a six-figure transaction, it may be realised that Sir William Beardmore has considerable faith both in his own engine and in the future of aviation. It would appear that the doubt of the general public concerning the commercial side of aeronautics at present is largely caused by the realisation on the part of the business man of the fact that aeroplanes have still to prove their ability (now that Government support is withdrawn) to show a return on the capital invested.

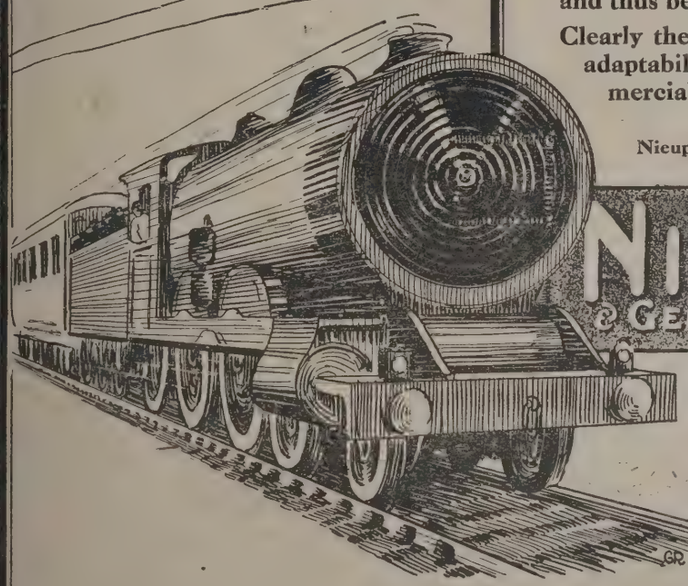


Anything that tends to reduce the initial cost and to inspire public confidence must therefore serve to make the immediate prospects of aviation more encouraging. This at any rate appears to have been the inference of Sir William Beardmore and the chiefs of his departments when reviewing the prospects, and one agrees that their inference is correct.

This move on the part of the Beardmore Company is bound to be of considerable value to the whole Aircraft Industry during the next year, but one may state that it is only the first move in the Beardmore policy. It would perhaps be inadvisable to go into further details as to later moves, but in general one may say that the Beardmore firm is by no means forgetful of the need for high power engines for big machines, and one may expect to see some very interesting developments in this direction when the proper time comes. And then the experience of the Beardmore Company in building thoroughly reliable engines in smaller powers will naturally give confidence in their newer productions.

On the whole, one considers that not only is the Beardmore firm to be congratulated on the foresight of its chief in taking this bold step, but that the Aircraft Industry, as a whole, is to be congratulated on the fact that Sir William Beardmore's faith in the future of flying has induced him to sanction such a big scheme.—C. G. G.

AN INTERESTING EXPERIMENT.—A curious twin-engined Rumpler biplane of 1916 or thereabouts. The engine-housing and under-carriage arrangements are particularly interesting.



THE STRIKE.

The Railway Strike has demonstrated in a remarkable degree how the Aeroplane may not only be a substitute for the steam engine but how it may actually supersede it.

Nieuport machines were at once requisitioned by the Government and are successfully carrying newspapers, mails and parcels to all parts of the country in record time. Business men take long and short distance trips in safety by 'plane, and thus become independent of railways.

Clearly the strike has shown the eminent adaptability of the Aeroplane for commercial purposes.

Illustrated above is the Nieuport 2-Seater Passenger 'Plane.

ENTHUSIASM AND HARD WORK.

Those who wish to find evidence of the deep depression that is said to have enveloped the aeronautical world should certainly not visit the larger and more enterprising firms in the industry.

While daily newspapers are telling their readers that civil aviation is a wash-out, the enthusiasts are carrying on work that will make the year 1919 remembered in history as the period that saw the dawn of what is destined to be one of the world's greatest industries. The spirit that animates many firms is well exemplified by the words of Major W. G. McMinnies, of the Avro Company, who, in a conversation the other day, cheerfully remarked that we all ought to be very grateful for living in the greatest time in history which gives all of us such magnificent opportunities.

This summer A. V. Roe and Co., Ltd., have given pleasure flights to over 30,000 people at an average price of one guinea per flight. Assuming that a distance of 10 miles is covered in each of the flights, we may say that the total mileage covered by these passengers is equivalent to twelve and a half times round the world. In this great distance there has only been one slight mishap to a passenger, who had his jaw injured in a crash. These figures should do much to inspire confidence among the general public.

Useful Work.

At the present time there is no doubt that these pleasure flights are playing a very useful part in the development of civil aviation. The thousands of people who have flown for the first time this summer almost invariably describe their experiences with enthusiasm to their friends, who become anxious to fly themselves.

Those who have flown once for pleasure are not likely to hesitate to use an aeroplane when urgent business requires them to travel quickly from place to place. One feels, therefore, that this work is educative and that the effect can only be good.

One makes this comment because in certain quarters one has heard it suggested that "joy-flying," as it is commonly called, is not serious aviation at all and is doing no good to the industry. There is no doubt that it is doing good, as it has demonstrated to the public that flying is a practical and pleasurable method of travelling.

The First Regular Service.

A. V. Roe and Co., Ltd., claim to have been the first firm to start a regular aeroplane service in Great Britain. About May 10th of this year they began daily flights between Manchester and Blackpool every day of the week, excluding Sunday, and this service was running regularly without any trouble whatever until Sept. 30th.

Three-seater machines with Le Rhone engines have been used. The machines left Blackpool at 12 noon, reached Southport at 12.15 and Manchester at 12.45, and the fares charged were five guineas for the single journey and nine guineas for the return

During ten days a regular service was in operation between Lake Windermere and Douglas, Isle of Man, for the purpose of carrying copies of the "Daily News" to the island. Avro seaplanes were used, and these were able to make the journey in from six to eight hours less time than that taken by train and boat.

During three weeks in July the "Evening Standard" was carried from London to Southsea and Brighton. During this period there was only one forced landing, and on that occasion another machine was sent out, took the papers from the one that had landed, and completed the journey, so very little time was wasted.

An Amphibious Machine.

From a practical point of view the short flights from London are not so successful as longer journeys, because when passengers or goods of any sort have been taken to Hounslow Aerodrome and then conveyed by air to their destination the same time has been taken as would be occupied by a train journey. A seaplane that could land on the Thames close to the newspaper offices and then fly to the coast towns would seem to be the solution of the difficulty. The ideal machine would be amphibious.

A large number of cross-country flights, mostly for business purposes, have been made. When the American N.C.4 made the first Translantic flight the "Daily Mirror" sent a photographer to Plymouth by air to obtain photographs of the machine and crew, which could not possibly have been obtained in the same time by any other means.

About the same time two Guards officers in London told A. V. Roe and Co., Ltd., that they wished to get to a town in Rutland to attend a birthday dinner-party, but had to be back for duty in London the same evening. A flight was arranged. They left London at 5.30 in the afternoon, arrived in good time for dinner, and were back for duty in London before 10 o'clock.

A Spirited Effort.

The Derby Day flights will be remembered by many. The company had undertaken to fly people down to the race-course, but many difficulties were in the way. Aeroplanes were prohibited from landing within two miles of the course, so the company hired a field about two and a half miles away. It was raining heavily on that day and there was a ground mist which gave the pilots some difficulty. Seven machines flew in formation and in their flights carried 44 people.

This effort must be regarded as a very spirited one on account of the difficulties which would have caused a less enterprising firm to abandon it. After the flights had been booked it was discovered that, as the regulations stood, it was illegal to make a charge for passenger flights. The money was therefore returned to those who had booked seats and the flights were given free of charge. This shows a spirit of determination to serve the public in spite of dilly-dallying obstruction, and is pleasing proof of the enthusiasm that is to be found in the industry.

At the present time the company is ready to take passengers to any part of the country at almost a moment's notice, and they have drawn up a tariff of regular charges as follows :—

List of Prices for a 3-seater Avro for 1 or 2 Passengers.

Hounslow to—	Single. £ s. d.	Return. £ s. d.	Approx. time taken for Single Trip. hr. min.
Harwich Folkestone Dover Southampton	18 15 0	25 0 0	1 0
Birmingham Bristol	26 0 0	35 0 0	1 25
Grantham	28 2 6	37 10 0	1 35
Nottingham	32 16 3	43 15 0	1 40
Sheffield	37 10 0	50 0 0	2 0
Doncaster Hull	43 14 0	58 5 0	2 25
Manchester Leeds	48 0 0	64 0 0	2 45
Swansea Liverpool	54 15 0	72 10 0	3 0
Plymouth Barrow	60 0 0	80 0 0	3 30
Holyhead Newcastle	67 10 0	90 0 0	3 45
Glasgow Edinburgh	112 10 0	150 0 0	6 0

A charge of £1 per hour is made when the machine is retained on the ground, up to a maximum of £10 per day. An additional charge of £3 10s. per hour is made for a five-seater Avro.

Engines for Commercial Aviation.

Mr. Priest, with whom the prospects were also discussed, expressed the opinion that the future of commercial aviation depends upon the designers and manufacturers of aero-engines. He pointed out that practically all the engines of to-day were designed for war use. High efficiency has been the chief consideration, and such points as economical running have not received the attention that is necessary when engines are to be produced for purely commercial purposes.

In striving for high efficiency engines have been produced which develop extremely high power in proportion to their weight, but the perhaps necessary result has been that such engines require very frequent overhauling. In war time, when large numbers of mechanics were available, this was not such a grave objection as it will be in commercial aviation at a time when skilled labour is expensive.

Mr. Priest thinks that for civil aerial transport work an engine is required which can be run economically with regard to fuel and oil and which will give long service without the constant attention that was required by the super-efficient aero-engine developed during the war. He does not think that the commercial engine need necessarily be water cooled, but thinks it probable that there is a great future for the air-cooled radial type.

Long-Distance Routes.

With regard to regular services, he does not think that there is much chance for development in Great Britain, though a limited amount of commercial flying might be done between England and Ireland. Long-distance routes between England and the Continent, and to countries that have not highly developed systems of railways, will offer the best chances for firms that intend to open up regular services.

RECENT
AIRCO SUCCESSES

THE AERIAL DERBY, 1919

THE winning machine, an Airco 4R, with a Napier engine, averaged a speed of 129 miles an hour—since declared a record by the Royal Aero Club. Two other Airco machines started, the Airco 4, with a Rolls-Royce engine, and the Airco 9, with a Siddeley "Puma" engine. The Airco 4 finished third, and the Airco 9 fifth. Of the seven machines finishing three were Aircos.

FIRST
THIRD
AND
FIFTH

AMERICAN AERIAL DERBY

IN this race, flown over a course 1,042 miles in length, the winning machine, an Airco 4, averaged throughout a speed of 136 miles an hour; while the second and third places were also secured by Airco 4's.

FIRST
SECOND
AND
THIRD

INTERNATIONAL RACE AT AMSTERDAM

IN this contest, flown in connection with the Aircraft Exhibition at Amsterdam, there were between thirty and forty starters, including the fastest of the French and Italian machines. The first and second speed prizes were won by Airco machines. The Airco 9R, with a Napier engine, the fastest machine in the race, covered the closed circuit of 130 miles at a speed of 145 miles an hour; while the second fastest time was that of the Airco 4A, with a Rolls-Royce motor.

THE AIRCRAFT MANUFACTURING COMPANY, LIMITED

London Office: 27, BUCKINGHAM GATE, S.W.1.

Chairman (and Founder, 1911), Mr. G. HOLT THOMAS.

Concerning the alleged assistance that the Government has given to those who are trying to develop commercial aviation Mr. Priest speaks bitterly. He thinks that if the Government had been a rival firm trying to crush competitors it would have acted exactly as it has been acting since the Armistice.

A case in point may be quoted. After the Armistice it became clear to A. V. Roe & Co., Ltd., that very large numbers of machines owned by the Ministry would be sold. The firm entered into negotiations to find out if it were possible to repurchase the machines, and went so far as to make a definite offer. This was refused on the grounds that the Disposal Board was unable to find out how many machines there were actually in hand!

Since then Avro machines have been sold by the Disposal Board, it is believed to purchasers all over the world, and A. V. Roe & Co., Ltd., have not been informed as to where the machines have been sent, so have been unable to follow up the business and offer their experience and resources to the purchasers.

It is thought that the Disposal Board may, for example, have sold Avro machines to Japan, where it is quite possible that they have simply been purchased as samples and may be copied.

Such methods can only lead to disaster in the industry. Had the firm been allowed to repurchase the machines, representatives would have been sent out to open negotiations with foreign countries and business would undoubtedly have resulted and continued. The Disposal Board has merely been distributing all over the world, at bargain rates, machines that incorporate the results of years of experiment, so that foreign competitors may pick the brains of British designers at their leisure.

The entire methods of disposing of aircraft are, Mr. Priest thinks, contrary to the interests of the industry. Instead of helping British manufacturers to gain the world's market, the Disposal Board seems to have regarded itself as an aircraft dealer determined to under-sell and to force its rivals (the manufacturers) out of the business. P. A. B.

"AIRCRAFT IN PEACE AND WAR."

Under the above title a very handsome brochure has been issued by the Blackburn Aeroplane and Motor Co., Ltd., of Leeds, in celebration of the tenth anniversary of the foundation of their business.

The Blackburn Aeroplane and Motor Co., Ltd., was founded in 1909 by Mr. Robert Blackburn, and so may be ranked as one of the few companies who were in a position to turn out aircraft at a moment's notice and thus helped to keep the original Air Services at the outbreak of war equipped with aircraft.

From August, 1914, up to the cessation of hostilities they were engaged in making numbers of aircraft of both their own and outside design.

Most of the text is written by Sir John Foster Fraser, F.R.G.S., who was one of the various people engaged by the British Government in propaganda work, and gives a complete description of the work and the works of the Blackburn Co. from their foundation to the present day, together with an idea of the future policy of the firm.

The whole brochure is very well printed on art paper and is illustrated with photographs of the machines built by the Blackburn Co. to their own and many other designs, views of the works, scale drawings and specifications of some of the machines built by them for war services, etc.

The company wish to point out that they will be very glad to supply a copy of this book to any person through whom they may hope to get into touch with business—that is, to anyone connected with the Press, to those having official or commercial connections with foreign countries, or to anyone connected with the Aircraft Industry either in this country or abroad.

A COLONIAL PROGRAMME.

The Nieuport and General Aircraft Company, of Cricklewood, London, has arranged an extensive Colonial programme. As commercial flying in this country has not developed yet to any great extent and shows no sign of doing so for some time to come, the company is not building many aeroplanes. Telephone switchboards and similar articles are being made. Complete plans have been made for building their several types of commercial machines at short notice, but as yet, owing to the number of machines demobilised from the R.A.F. which can be bought fairly cheaply, there is very little demand for new machines.

In the Colonies there is a great immediate future for commercial aviation, and the Nieuport Company are not blind to the possibilities. They have sent out representatives to Canada, South Africa, and India, and Mr. Sydney Pickles is acting as their agent in Australia. A British Nieuport machine will be sent to him.

The Colonial representatives of the company are all pilots late R.A.F. Capt. Reginald S. Carroll, A.F.C., is the representative at Bombay, for Asia. Capt P. C. C. Passman is the representative at Cape Town, South Africa.

A scheme has been prepared to cover South Africa with a network of services, and has been submitted to the Government. It is hoped that Capt. Passman will interest the financiers of the country so much that South African capital will be put into the enterprise.—G. I. Dore.

THE ROYAL AERO CLUB.

SPECIAL COMMITTEE MEETING.

A Special Meeting of the Committee was held on Wednesday, October 1st, 1919, when there were present:—Group-Captain C. R. Samson, C.M.G., D.S.O., R.A.F., in the Chair, Mr. Ernest C. Bucknall, Lieut.-Col. F. K. McClean, Air-Commodore E. M Maitland, C.M.G., D.S.O., R.A.F., Lieut.-Col. Alec Ogilvie, and the Secretary.

Election of Members.—The following New Members were elected:—The Hon. Mrs. Bethell, Ronald William Carmichael, Leo Austin Walsh, Vivian Claud Walsh.

Schneider Trophy.—Mr. Priest, of Messrs. A. V. Roe and Co., attended before the Committee in support of the protest lodged by his Company against the elimination of the Roe Seaplane from the Schneider Race.

Royal Aero Club Seaplane Competition.—The report of the Technical and Competitions Committee was presented by Lieut.-Col. F. K. McClean.

On the motion of Lieut.-Col. Alec Ogilvie, seconded by Mr. Ernest C. Bucknall, it was unanimously resolved: "That on account of the Railway Strike, the Royal Aero Club Seaplane Competition proposed to be held at the end of October, 1919, be postponed."

HOUSE COMMITTEE.

A Meeting of the House Committee was held on Monday, September 29th, 1919, when there were present:—Mr. Ernest C. Bucknall, in the Chair, Mr. Herbert J. Corin, and the Secretary.

THE FLYING SERVICES FUND.

A Meeting of the Flying Services Fund Committee was held on Friday, September 26th, 1919, when there were present:—Group-Captain C. R. Samson, C.M.G., D.S.O., R.A.F., in the Chair, Mr. Chester Fox, Squadron-Leader T. O'B. Hubbard, M.C., R.A.F., and the Secretary.

Grants and Allowances.—The following Grants and Allowances were made:—

(13) The School Fees of £3 15s. of the son of the father of a Lieutenant in the Royal Flying Corps killed on active service.

(105) An allowance of £3 a month for six months to the mother of a Cadet who died on active service.

(112) An allowance of £3 a month for six months to the widow of a 1st Class Air Mechanic in the Royal Air Force killed on active service.

(129) An allowance of £4 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Flying Corps killed on active service.

(141) An allowance of £4 a month for six months to the widow of a Private in the Royal Air Force who died on active service.

(145) An allowance of £4 a month for six months to the mother of a Private in the Royal Flying Corps killed on active service.

(148) An allowance of £1 a month for six months to the mother of a Private in the Royal Flying Corps who died on active service.

(153) An allowance of £2 a month for twelve months to the widow of a 2nd Class Air Mechanic in the Royal Flying Corps killed on active service.

(161) An allowance of £2 a month for six months to the mother of a Private in the Royal Air Force who died on active service.

(164) An allowance of £4 a month for six months to the mother of a Private in the Royal Flying Corps who died on active service.

(172) An allowance of £2 a month for six months to the widow of a Private in the Royal Flying Corps killed on active service.

(178) A Grant of £10 to the widow of a Sergeant Mechanic in the Royal Flying Corps killed on active service.

(183) An allowance of £1 a month for six months to the mother of a 3rd Class Air Mechanic in the Royal Flying Corps who died on active service.

(230) An allowance of £1 10s. a month for six months to the mother of a 3rd Class Air Mechanic in the Royal Air Force killed on active service.

(231) An allowance of £2 a month for six months to the mother of a 2nd Class Air Mechanic in the Royal Air Force killed on active service.

(251) The School Fees up to £50 per annum of the brother of an ex-Flight Sub-Lieutenant in the Royal Naval Air Service incapacitated on active service.

(253) An allowance of £4 a month for six months to the widow of a Private in the Royal Air Force who died on active service.

(258) An allowance of £3 a month for six months to the mother of a 1st Class Air Mechanic in the Royal Air Force who died on active service.

(263) An allowance of £3 a month for six months to the mother of a Private in the Royal Air Force who died on active service.

(265) An allowance of £2 a month for three months to the mother of a 2nd Class Air Mechanic in the Royal Flying Corps who died on active service.

(268) An allowance of £2 a month for three months to an ex-A.M.I. in the Royal Naval Air Service incapacitated on active service.

THE FIRST DIRECT NON-STOP TRANSATLANTIC FLIGHT.

There has been a widespread expression of opinion that the first direct Transatlantic Flight by Sir John Alcock and Sir Arthur Brown on a Vickers' "Vimy" Rolls Biplane on June 14th-15th, 1919, should be permanently recorded in the Club House.

The idea has been fully considered by the Committee, and they have decided to obtain portraits in oils, for hanging in the Club, of both Sir John Alcock and Sir Arthur Brown.

Sir John Lavery has very kindly consented to paint the portraits at a purely nominal figure, the canvases being 30 in. by 25 in.

A subscription list has been opened and subscriptions limited to £1 1s. are invited towards the cost.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

Commenting upon a paper on "The Scientific Progress of Aviation during the War," which was read before the British Association by Mr. Bairstow, Capt. Sayers points out that the author really admits that the progress made is very small. If this fact is properly realised by those who are concerned in the scientific study of aerodynamics, there is some prospect of a real advance in knowledge.

A Siemens Schuckert single-seat fighter, fitted with the Siemens rotary engine, is described in this issue. This machine was produced too late to take part in the war, but it is understood to have given very fine results on its tests. A note upon, and a drawing of the Siemens rotary engine, is also given. The opposite rotation of the cylinders and the crankshaft is a novel feature in a practicable engine. Though the principle has been often suggested, it has never before been successfully employed.

Aeroplanes produced by the firm of Vickers, Ltd. are the subject of this week's instalment of "Modern British Aeroplanes."

THE SCIENTIFIC PROGRESS OF AVIATION DURING THE WAR.

By Capt. W. H. SAYERS, late R.A.F.

A paper read by Mr. Leonard Bairstow, F.R.S., C.B.E., before "G" Section (Engineering) of the British Association during their recent session at Bournemouth, bearing the above title, raises quite a number of fields for instructive discussion.

In the first place, the paper, as a whole, serves to accentuate the fact that aviation, in so far as the design of aircraft is concerned, has made little, if any, progress during the war, since, if it had, Mr. Bairstow would scarcely have refrained from mentioning the fact. In actual fact, the main part of Mr. Bairstow's paper deals with the subject of the relation of model tests to full-size results.

In this matter Mr. Bairstow is perfectly frank. He says:—

"No single case of fluid motion round objects used in aviation has as yet been deduced from a solution of the equations of motion, and the process followed has been frankly empirical. One of the most important early problems was the finding of that shape of aeroplane which gave minimum resistance for a given lift due to motion. Within somewhat narrow limits this problem has been solved, and for some time it has been possible to say that an aeroplane of good design would fly at a speed known from its weight and horse-power. Similar standard relations apply to the rate of climb and to the height to which it can climb."

If this means anything—and it must be presumed to—it must mean that the properties of aerofoils and the general proportions of the various parts of an aeroplane to give the minimum of resistance have been so fully and definitely established by model experiment that, armed with the results of these experiments, one reasonably capable designer is as good as any other.

In actual fact this standardisation of aeroplane performances for any given weight per horse-power has little to do with the accuracy or reliability of model tests or of any other determination of the best form for aerofoils. It is almost entirely the result of war conditions. A designer attacking the problem of turning out, let us say, a single-seater fighter against time and in competition with other designers, quite naturally based his attempt on the known performance of the best existing machines of similar type.

Under the special conditions no extensive experimental work was possible, and for safety's sake standard forms for aerofoils, strut sections, and the like had to be used, with at the most very minor modifications.

The loading of any standard aerofoil section was fixed within fairly narrow limits by the landing speed called for—and to all intents and purposes very little was left to the individual designer except to keep his structure weight, and hence his total weight, down to the minimum.

This weight per h.p. in practice has been the only important variable within the average designer's control, and there is little remarkable in the fact that performance can be measured fairly accurately as a function of this particular variable alone.

Had the conditions of the past five years uniformly called for a landing speed of between 20 and 30 miles per hour instead of from 40 to 55, the standard curves of maximum speed, of climb, and of ceiling plotted against weight per h.p. would have been quite different from the present ones, and the fact that so empirical a method of predicting performance is so generally accurate proves nothing but that aeroplane design is in a state of stagnation.

The only fact of real importance is that over the range from an S.E.5 to a Handley Page size makes no appreciable difference to the performance for a given weight per h.p., which is to say in effect that within the present limits of size of aeroplanes there is no marked change in the general character of the air disturbance set up in flight, and consequently no important "scale effect."

Mr. Bairstow then proceeds to discuss, purely from the scientific point of view, the whole question of the application of the result of tests on models to the prediction of full-size effects.

The whole theory of the validity of model tests rests on the assumption that the nature of the air flow round the model under test is similar to that of the flow round the full-size component under working conditions.

When a fluid of high viscosity, which for the present purpose may be approximately rendered as of great stickiness, is forced past an obstructing body at a low speed, this stickiness prevents any abrupt changes in the velocity of adjacent particles of fluid, and the flow in consequence is smooth and steady, with quite slow changes in either the direction or velocity.

If either the velocity of the flow past the obstacle be increased, or the viscosity of the fluid be decreased to a sufficient extent, this "stickiness" is overcome by the inertia of the moving particles of fluid, and sudden and abrupt changes, both of velocity and of direction, may occur, leading to an entirely different type of flow, which may produce a total change in the resistance characteristics of the obstacle.

It is fairly obvious that the determining factor of a sudden change of flow in a fluid of given density and viscosity is some measure of the maximum acceleration impressed upon the fluid in passing round it, and that thus both the shape and the size of the obstacle will influence the conditions under which similar forms of flow will occur.

Upon this line of reasoning it is only safe to assume that the results of a wind-tunnel test on a model of L feet span can only be applied with certainty to a scale enlargement in every detail of that model of n times the span when the model is tested at an air speed n times that of the full-sized machine.

Thus, if the machine of which a model is to be tested be of 36 ft. span and its resistance characteristics are required at 100 m.p.h., then a 36 in. span model tested at 1,200 m.p.h. should give directly applicable results.

Unfortunately it does not, because the general theory of the similarity of flow assumes that air is incompressible by the forces set up in its movement—an assumption fairly close to the truth at low velocities, but very far from it at speeds approaching that of sound—and it is in most cases impossible to arrange a sufficiently high air speed in a wind tunnel to render model tests directly applicable to full-scale work without running into this difficulty.

It is frankly admitted by Mr. Bairstow that the changes in the resistance of two similar bodies which are caused by differences of dimension or differences of velocity, cannot yet be calculated, and that the whole basis of the application of model tests to full-scale work is the experimentally established fact that within limits it is found that the resistance of a model in a wind tunnel and a machine in flight do vary as the square of the dimensions of the two bodies and as the square of the air speeds. Although the resistances do vary from the square law within the limits now in question, the variations seem to be slow and regular, and it is therefore assumed that the type of air flow round the model is nearly similar to that round the full-scale machine.

Mr. Bairstow states that attempts at the mathematical solution of the conditions of flow in certain typical cases are now being attempted at the N.P.L.—with the assistance of Miss Cave—and that it is hoped in time to achieve some success in this effort, and thereby place the relations between model and full-size experiments upon a sound mathematical basis.

In the meantime Mr. Bairstow's lecture may be welcomed as a very frank admission that model tests can be relied upon to just that extent to which full-sized practice bears them out, and no further.

As it is a fact admitted by the N.P.L. authorities that, although in certain cases there is only a negligible difference between the lift coefficients of a model and of a full-size wing, there are in the same cases differences of the order of 15 per cent. between the drag coefficients on the two scales, it seems fairly just to assume the possibility of very much greater divergences between models and full-size machines when changes in the form of wings, etc., which lead to greatly different values of the pressure coefficient are involved.

It may therefore be taken as an admitted fact that model experiments, unsupported by full-size tests, are at present of little value to anybody. There is some reason to believe that a great deal of harm has been done in the past by a failure on the part of the N.P.L. and the Advisory Committee for Aeronautics to recognise this, and it is to be hoped that in future, under Mr. Bairstow's guidance, this error may be avoided.

The accompanying photograph shows an Airco D.H.4 machine with a Napier "Lion" engine, 450 h.p., which was flown by Capt. Gathergood, A.F.C., for the first time in the Aerial Derby. Since then, as may be seen, the wing arrangement has been altered, and it was flown by Capt. Gathergood to the E.L.T.A. Exhibition at Amsterdam in 2 hr. 10 min., this being the fastest time for the journey. While in Amsterdam, he flew the same machine in a race of 137 miles, which he won at an average speed of 145 m.p.h., against 35 competitors. The next machine in the race took 10 minutes longer over the course. These performances, and the non-stop flight to Madrid in 7¾ hrs., as the power plant of an Alliance biplane, prove the Napier to be in the very first rank of aero engines.

From the early days of aviation

The "Bristol" Aeroplanes

have been famous for

QUALITY

RELIABILITY

and

ENDURABILITY

The "BRISTOL" FIGHTER Type F2.B.

In September, 1917, a "BRISTOL" Fighter was delivered from the "BRISTOL" works and put into commission in the fighting area. It was unfortunately landed in Holland and soon afterwards was acquired by the Dutch Government. From that time until now, though in continuous use by Dutch pilots, it has never been repaired or renovated in any way, and every unit is exactly as when it left the "BRISTOL" works. Even the "Cellon" dope has never been renewed.

MODERN BRITISH AEROPLANES.

XVIII.—Vickers, Ltd.

The Vickers Type F.B. 16H. Single-seat Fighter (300 h.p. Hispano-Suiza Engine).

The Aviation Department of Vickers, Ltd., was founded in 1911 under the control of the late Major Wood (9th Lancers).

Originally, the firm acquired the sole British rights in the R.E.P. machine of M. Robert Esnault Pelterie. Starting from this basis the department under Major Wood developed the series of machines with which the name of Vickers is associated.

The Vickers "Gun-'bus," originally produced in 1913, was the only practicable fighting machine in the possession of the R.F.C. at the outbreak of war, and rendered invaluable services during the first six months of hostilities.

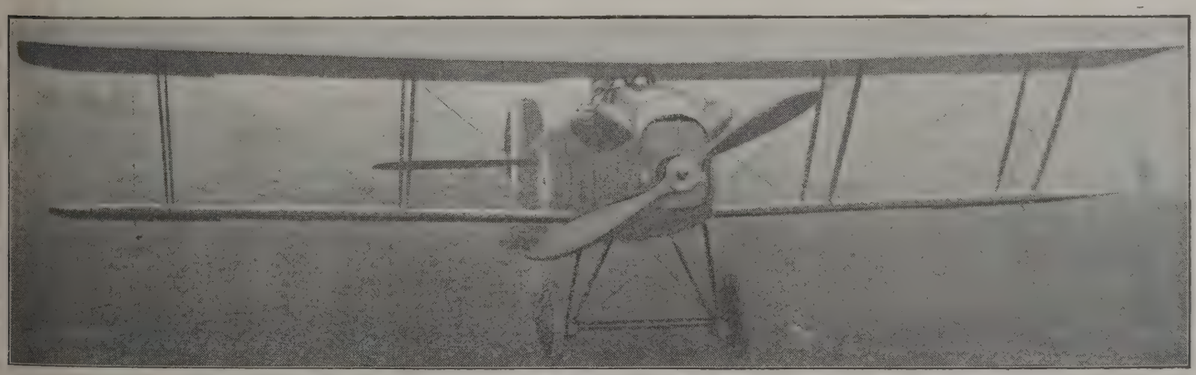
Since then Vickers, Ltd., have manufactured aeroplanes of many types and sizes with conspicuous success and some of their recent products are described hereafter.

THE VICKERS F.B. 16H.

The Vickers F.B. 16H. is a single-seater fighting scout. The planes are rather heavily staggered, and fitted with two pairs of struts either side of the fuselage, no centre section is fitted, the top planes being fitted direct to the inverted Vees forming a cabane in front of the pilot's seat. The top plane is well cut away over the pilot's seat to give a clear view upwards.

The tail unit consists of a large fin and unbalanced rubber and tail plane and divided elevators, the fin and tail-plane being well braced above and below with Rafwire.

The elevator controls are outside the fuselage.



The armament consists of two fixed Vickers' guns fitted inside the cowling in front of the pilot's cockpit.

SPECIFICATION :—

Type of machine	Tractor Biplane, single-seater
Name or type No. of machine	F.B. 16H.
Purpose for which intended	Fighter.
Span	T. 31 ft. ; b. 30 ft.
Gap, maximum and minimum	4 ft. 5 in.
Overall length	21 ft. 8 in.
Maximum height	8 ft. 1 in.
Chord	T. 5 ft. 4 in. ; b. 4 ft. 2 in.
Total surface of wings	272 sq. ft.
Span of tail	11 ft.
Total area of tail	33.8 sq. ft.
Area of elevators	15.3 sq. ft.
Area of rudder	6.5 sq. ft.
Area of fin	7 sq. ft.
Area of each aileron and total area	2 × 9.5 + 2 × 6 = 31 sq. ft.
Maximum cross section of body	8 sq. ft.
Horizontal area of body	36 sq. ft.
Vertical area of body	57 sq. ft
Engine type and h.p.	Hispano-Suiza ; 300 h.p.
Airscrew, diam., pitch, and revs.	8 ft., 6 ft., 1,875.
Weight of machine empty	1,636 lbs.
Load per sq. ft.	8.45 lbs.
Weight per h.p. (300 h.p.)	7.65 lbs.
Tank capacity in gallons	Petrol 40 galls. ; oil 5 galls.

PERFORMANCE—

Speed low down	147 m.p.h.
Speed at 10,000 feet	140 m.p.h.
Landing speed	53 m.p.h.

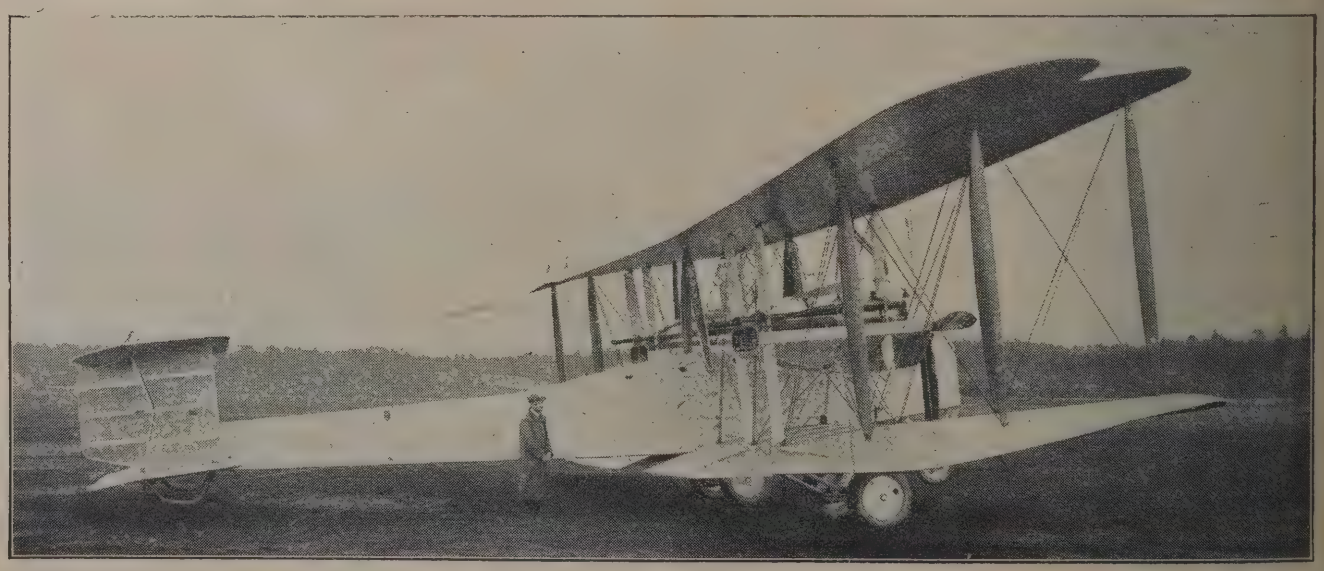
Front View of the Vickers F.B. 16H. Single-seat Fighter (300 h.p. Hispano-Suiza Engine).

Three-quarter Front View of the Vickers "Vampire" Trench Fighter (200 h.p. B.R.2 Engine).

Climb—	
To 5,000 feet in minutes	3.3 minutes.
To 10,000 feet in minutes	7.8 minutes.
To 20,000 feet in minutes	23.5 minutes.
Disposable load apart from fuel (including crew)	327 lbs.
Total weight of machine loaded	2,300 lbs.

THE VICKERS "VAMPIRE."

The Vickers "Vampire" is a small single-seater pusher fighter designed primarily for trench fighting.



The small nacelle is directly under the under-surface of the top plane, and is connected to the lower plane by short struts. The tail booms are fitted at the ends of each of the rear inner interplane struts, and are parallel in plan view, but in elevation converge at the fixed tail-plane. The chassis is of the usual Vee type, rubber sprung.

SPECIFICATION :—

Type of machine	Pusher Biplane, single-seater.
Name or type No. of machine ...	"Vampire" B. R. 2.
Purpose for which intended	Trench fighting.
Span	Top 31 ft. 6 in. ; bottom 27 ft. 6 in.
Gap, maximum and minimum ...	52 in.
Overall length	22 ft. 11 in.
Maximum height	9 ft. 5 in.
Chord	Top. 5 ft. 6 in. ; bottom, 4 ft. 6 in.
Total surface of wings.....	267 sq. ft.
Span of tail.....	12 ft. 3 in.
Total area of tail	38 sq. ft.
Area of elevators	16 sq. ft.
Area of rudder	6.7 sq. ft.
Area of fin	6.4 sq. ft.
Area of each aileron and total area	(2 x 12) + (2 x 6) = 36 sq. ft.
Maximum cross section of body...	7.6 sq. ft.
Horizontal area of body	16.6 sq. ft.
Vertical area of body	24.5 sq. ft.
Engine type and h.p.	B.R. 2 ; 200 h.p.
Airscrew, diam., pitch, and revs.	8.75 ft., 9 ft., 1,300.
Weight of machine empty (including 500 lbs. steel armour...	1,870 lbs.
Load per sq. ft.....	9.1 lbs.
Weight per h.p. (228 h.p.)	10.7 lbs.
Tank capacity in gallons	Petrol 29 galls. ; oil 6 galls.
PERFORMANCE—	
Speed low down	121 m.p.h.
Speed at 10,000 feet	115 m.p.h.
Landing speed	54 m.p.h.
Climb—	
To 5,000 feet in minutes	5 minutes.
To 10,000 feet in minutes	12 minutes.
Disposable load apart from fuel (including crew)	568 lbs.
Total weight of machine loaded...	2,438 lbs.

THE VICKERS "VIMY" TWIN-ENGINED BIPLANE.

The Vickers "Vimy" was designed as a long-distance bomber, and, following the usual practice of twin-engined machines, has a single fuselage, carrying the pilot and two gunners, one in the nose, and the other just aft of the trailing edge of the main planes.

Side View of the Vickers "Vimy" twin-engined Bomber (two Rolls-Royce "Eagle" engines 375 h.p. each), on which Capt. John Alcock, D.S.C., and Lieut. Arthur Brown flew the Atlantic.

The Proved Best.

NAPIER

British Built.

AERO ENGINES.

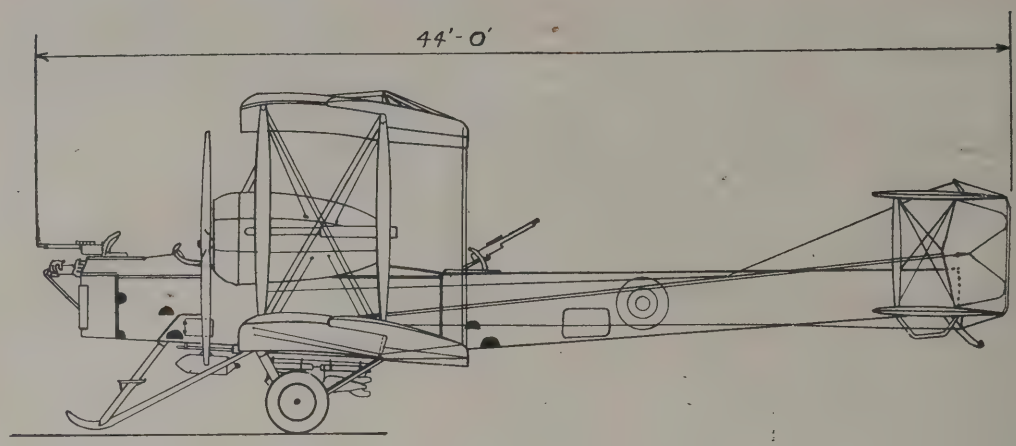
POWER - - 450 H.P.
WEIGHT - - 850 LBS.

¶ The total dry weight of the Napier Aero **Engine is** 850 lbs., and it develops 450 h.p.

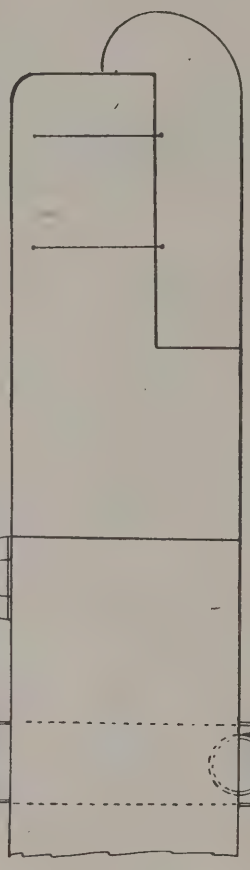
ONLY 1·89 LBS. PER H.P.

¶ The Napier Aero Engine is especially economical in oil and petrol consumption, thereby enabling a greater *useful* load to be carried.

¶ The light weight per h.p. developed, proved efficiency, and reliability of the 450 h.p. Napier Aero Engine, gives the Aeroplane to which it is fitted great advantages for long distance flights.



FIRST to reach Six Miles up in the Air.
FIRST in Aerial Derby—open to all comers.
FIRST to make direct Non-stop Flight from London to Madrid.
HOLDER of British Speed Record in closed circuit.



Please write for Catalogue giving full particulars of this engine.

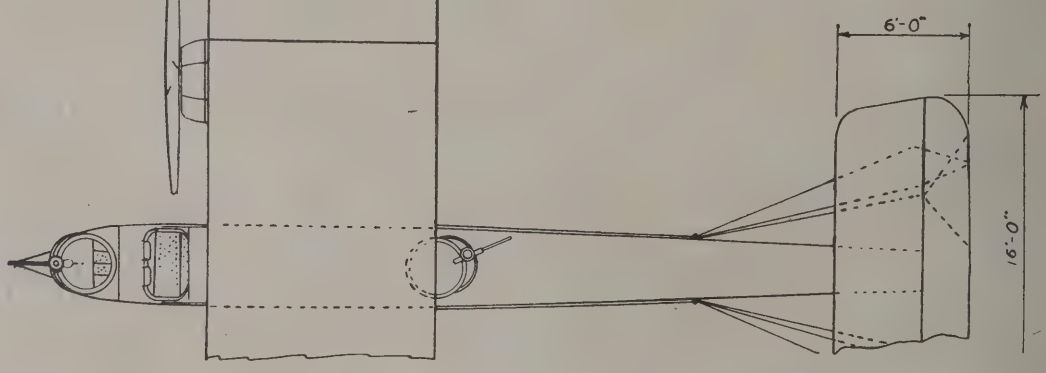
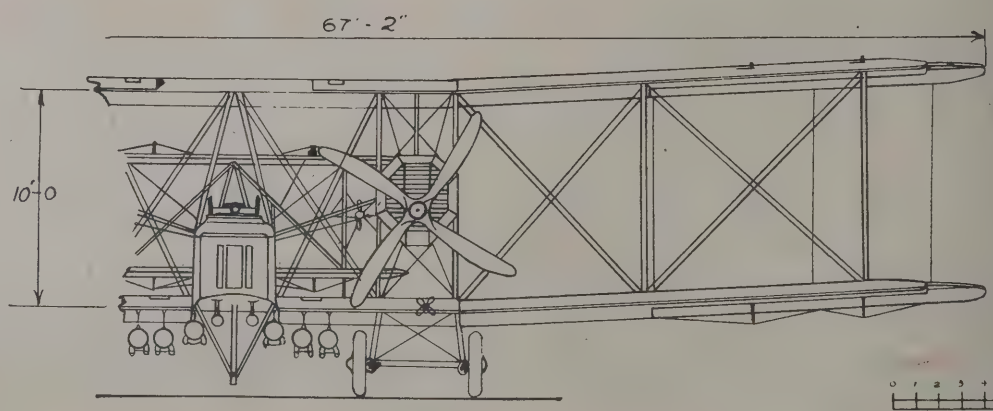
Works: ACTON, LONDON, W.3.

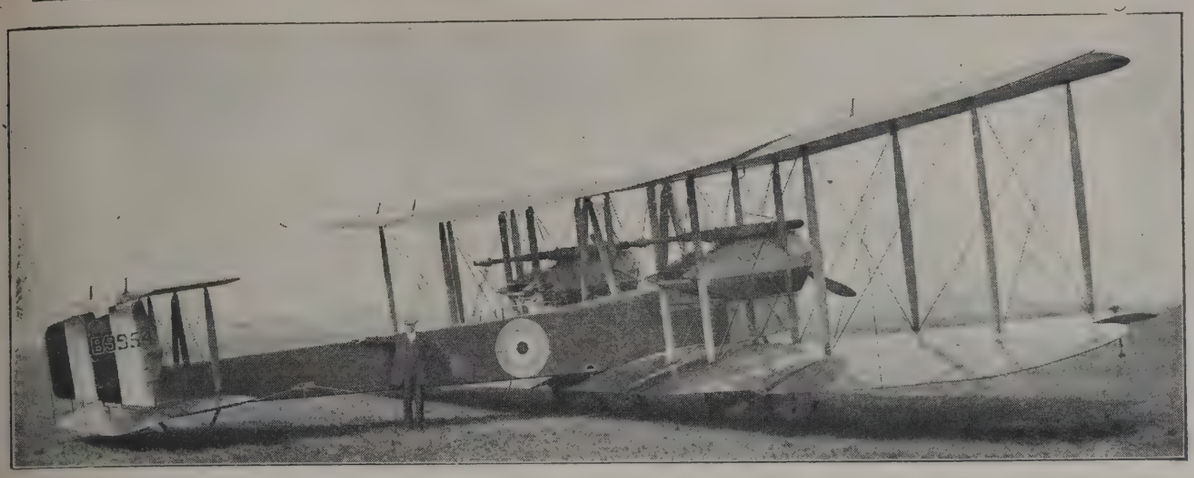




VICKERS

VIMY

AEROPLANE



SCALE

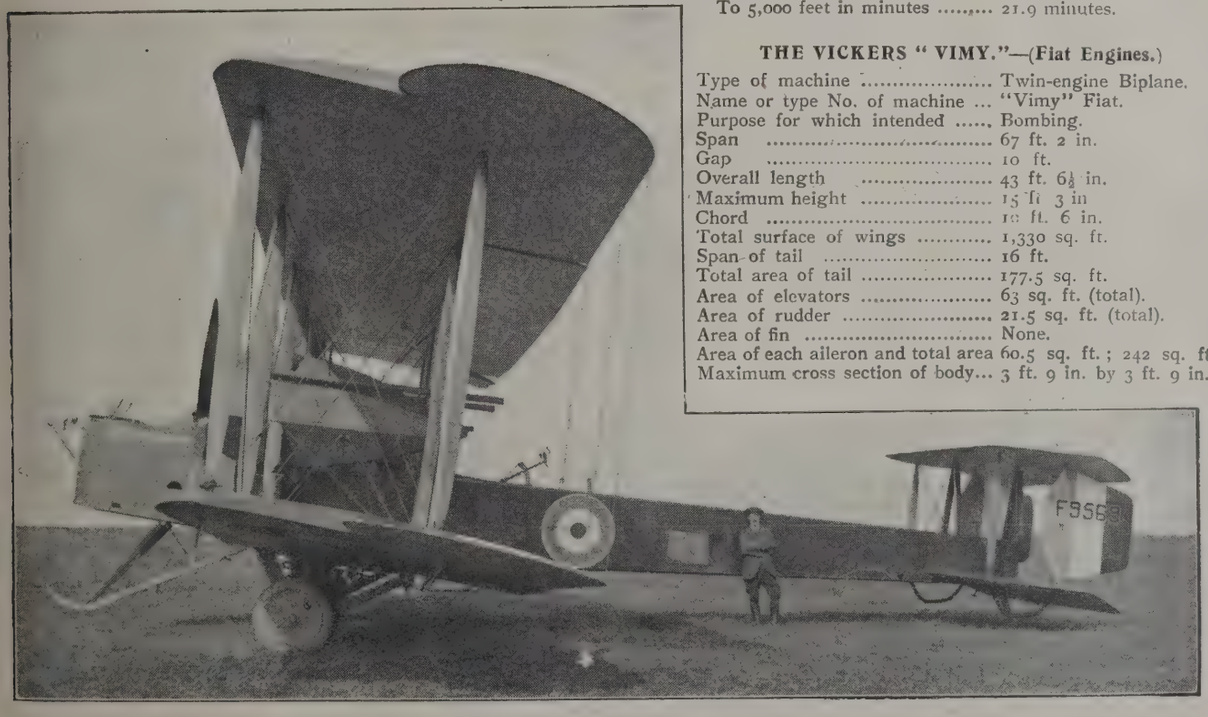
FORD-JONES 19

Three-quarter Side View of a Fiat-engined "Vimy" Bomber.

The engines are housed in "power-eggs," each containing one complete power unit, with its respective petrol and oil tanks, carried halfway between the planes, one on either side of the fuselage.

Under each engine unit is a separate undercarriage of two Vees of steel tube, between which an axle and two wheels are slung on shock-absorber.

To prevent the machine standing on its nose after too fast a landing a skid is fitted under the front of the fuselage.

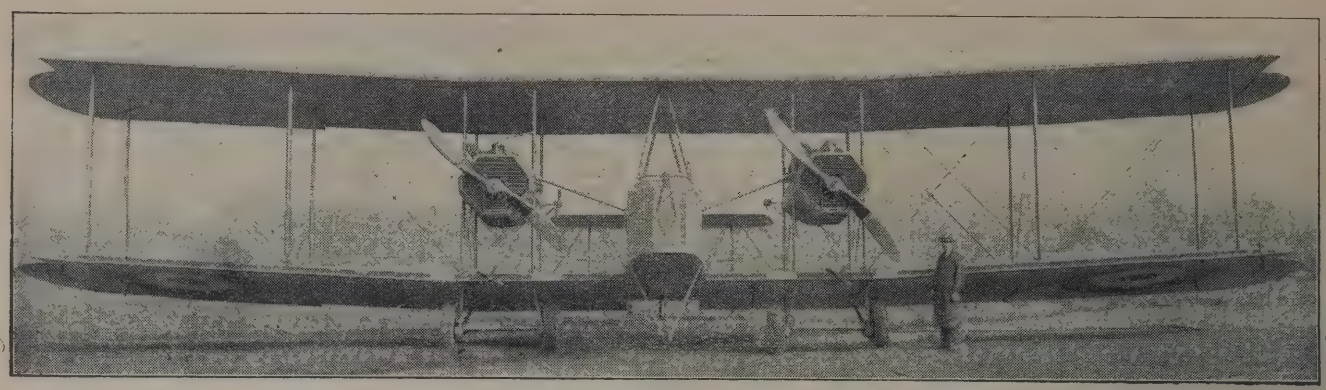


Four large balanced ailerons are fitted to the main planes. The empennage consists of a biplane tail fitted with unbalanced elevators, and twin rudders with no fixed fin-area.

It is probably unnecessary to remind readers of The Aeroplane that the Vickers "Vimy" is the machine upon which Capt. Sir John Alcock and Lieut. Sir Arthur Whitten Brown made the first non-stop Atlantic flight.

The following specification gives particulars of this machine fitted with various types of engine :—

THE VICKERS "VIMY."—(Rolls-Royce Engines.)



Type of machine	Twin-engine Biplane.
Name or type No. of machine	"Vimy" Rolls.
Purpose for which intended	Bombing.
Span	67 ft. 2 in.
Gap	10 ft.
Overall length	44 ft.
Maximum height	15 ft.
Chord	10 ft. 6 in.
Total surface of wings	1,330 sq. ft.
Span of tail	16 ft.
Total area of tail	177.5 sq. ft.
Area of elevators	63 sq. ft. (total).
Area of rudder	21.5 sq. ft.
Area of fin	None.
Area of each aileron and total area	60.5 sq. ft. ; 242 sq. ft.
Maximum cross section of body	3 ft. 9 in. by 3 ft. 9 in.
Horizontal area of body	125 sq. ft.
Vertical area of body	120 sq. ft.
Engine type and h.p.	Two 350 h.p. "Eagle Mark VIII" Rolls-Royce.
Airscrew, diam., pitch, and revs.	10.5 ft. dia., 9 ft. 11 in. pitch, 1,950 revs.
Weight of machine empty	7,100 lbs.
Tank capacity in gallons	Petrol 452 galls. ; oil 18 galls.
Disposable load apart from fuel	2,010 lbs. (including crew of 3)
Total weight of machine loaded	12,500 lbs.
Load per sq. ft.	9.4 lbs.
Weight per h.p.	17.8 lbs.
Performance—	
Speed low down	103 m.p.h.
Speed at 5,000 feet	98 m.p.h.
Speed at 10,000 feet	
Landing speed	56 m.p.h.
Climb—	
To 5,000 feet in minutes	21.9 minutes.

Side View of a Fiat-engined "Vimy" Bomber.

THE VICKERS "VIMY."—(Fiat Engines.)

Type of machine	Twin-engine Biplane.
Name or type No. of machine	"Vimy" Fiat.
Purpose for which intended	Bombing.
Span	67 ft. 2 in.
Gap	10 ft.
Overall length	43 ft. 6⅛ in.
Maximum height	15 ft. 3 in.
Chord	10 ft. 6 in.
Total surface of wings	1,330 sq. ft.
Span of tail	16 ft.

Weight of machine empty	6,426 lbs.
Tank capacity in hours	
Tank capacity in gallons	Petrol 170 galls.; oil 17 galls.
Disposable load apart from fuel	2,479 lbs. (including crew of 3)
Total weight of machine loaded	10,300 lbs.
Load per sq. ft.	7.75 lbs.
Weight per h.p.	17.2 lbsfl
PERFORMANCE—	
Speed low down	98 m.p.h.
Speed at 5,000 feet	96 m.p.h.
Speed at 20,000 feet	
Landing speed	53 m.p.h.
Climb—	
To 5,000 feet in minutes	14 minutes.
To 10,000 feet in minutes	45 minutes.

THE VICKERS "VIMY."—(Hispano-Suiza Engines.)

Type of machine	Two-engine Biplane.
Name or type No. of machine	"Vimy" Hispano.
Purpose for which intended	Bombing.
Span	67 ft. 2 in.
Gap	10 ft.
Overall length	43 ft. 6⅛ in.
Maximum height	15 ft. 3 in.
Chord	10 ft. 6 in.
Total surface of wings	1,330 sq. ft.
Span of tail	16 ft.
Total area of tail	177.5 sq. ft.
Area of elevators	63 sq. ft. (total).
Area of rudders	21.5 sq. ft. (total).
Area of fin	None.
Area of each aileron and total area	60.5 sq. ft.; 242 sq. ft.
Maximum cross section of body	3 ft. 9 in. by 3 ft. 9 in.
Horizontal area of body	125 sq. ft
Vertical area of body	120 sq ft
Engine type and h.p.	Two 200 h.p. Hispano-Suiza.
Airscrew, diam., pitch, and revs.	9.25 ft. dia., 5 ft. pitch, 2,100 revs.
Weight of machine empty	5,420 lbs.
Tank capacity in gallons	Petrol 91 galls.; oil 14 galls.
Disposable load apart from fuel	2,900lbs. (including crew of 3)
Total weight of machine	9,120 lbs.
Load per sq. ft.	6.85 lbs.
Weight per h.p.	22.8 lbs.
PERFORMANCE—	
Speed low down	90 m.p.h.
Speed at 5,000 feet	87 m.p.h.
Speed at 20,000 feet	
Landing speed	51 m.p.h.
Climb—	
To 5,000 feet in minutes	23.5 minutes.

Since the Armistice, the Vickers "Vimy" has been converted to a commercial mail and passenger-carrying machine by fitting it with a new fuselage designed to carry passengers and/or merchandise.

This version of the machine was described and illustrated in detail in the issue of The Aeroplane of June 11th, 1919. The trans-Atlantic "Vimy," illustrated on page 1314, piloted by Capt. Alcock, was a standard bomber fitted with big tanks in lieu of places for bombs and gun.

A View of the Vickers Stand at the E.L.T.A. Exhibition at Amsterdam. In the foreground a Vimy Bomber, and to the Left Rear the Cabin Compartment Unit of a "Vimy" Passenger-carrier.

VICKERS LIMITED

THE TRANSATLANTIC FLIGHT
"VICKERS - VIMY - ROLLS"

The first direct Flight from Newfoundland to Ireland (1,900 miles) was accomplished by this Aeroplane in 15 hrs 57 mins. 4 tons of Petrol and Oil were used.

THE SIEMENS-SCHUCKERT D.IV SINGLE-SEATER.

The Siemens-Schuckert scout with a rotary motor was referred to in THE AEROPLANE of Dec. 25th, 1918. More information is now available, the particulars following having been published in a recent issue of "Flugsport."

The Siemens-Schuckert D.IV single-seater biplane was turned out for a fighting scout competition which was held in January, 1918, comparable to the French war-time avion trials. Equipped with a 11-cyl. Siemens and Halske rotary engine, the machine showed a climb in excess of the then requirements, and possessed good manœuvring qualities and sufficient speed. To improve the type the speed, especially in diving, was increased at the expense of the climbing capacity by changing the form and section of the wings. The form and detailed measures are evident from the scale drawings. The total span amounts to 8.35 metres with a chord of 1 metre; neither arrow nor V arrangement is employed.

The aircraft is equipped with a four-bladed airscrew of a diameter of 2.80 metres and a pitch of 3.90 metres, the Germans having also found this type of advantage, claiming to attain much in this case without loss of efficiency, as proved by test. The landing gear can be shortened and landings rendered much easier at high speeds (and why not mention the reduced head resistance and accordingly speed increase from the former result?—TRANSLATOR).

The body is made of three-ply wood, shaped to offer a minimum of head resistance. The plywood is nailed in single plies to the girder of bulkheads and four pine longitudinals, a feature being the diagonal wooden pieces going from bulkhead to bulkhead and affording the fuselage a special rigidity.

The rudder, elevator, and lower keel fin, arranged as a skid support, are mounted on the body end. The tail plane is curved symmetrically on both sides and has an angle of incidence of 0 deg. The rudder is curved on one side to neutralise the spin of the slip stream. The top fin and the fixed tail plane are attached in the usual way. The rudder and elevator are both balanced, and as the rudder is provided above the elevator the latter is made in one piece.

Both the rudder and elevator are made of tubes and sheet-metal ribs, and all control cables are doubled and pass over no pulleys.

The seat of the pilot rests on duralumin tubes and can be adjusted in two directions, and the safety-belt of the pilot is fixed to the longerons with intermediate spiral springs.

The pilot's cockpit is equipped with the usual instruments (tachometer, compass, altimeter, throttle and the ignition

Three-quarter Front View of the Siemens Type D.IV Single-seater Fighter.

The Rotary-engined Siemens D.IV Fighter

levers, magneto switch, petrol stop-cock, etc.). The control lever carries at the top end the normal hand-grip adopted by the German Army authorities, and on the left side is fitted with a throttle lever. Furthermore, a special lever is provided as an emergency throttle for the engine. By means of a special locking device the controls can be maintained in any position. The control lever is carried in a fork in a longitudinal lay-shaft which carries at its front end a twin lever for the control of the ailerons, which are made entirely of steel tubes to be as little as possible vulnerable to gun-fire.

The steel tube landing gear is of the standard V type. The main axle is made of chrome-nickel steel of 55 mm. diameter and is suspended on spiral springs. The landing gear is streamlined by means of aluminium sheets with the object of reducing head resistance.

The top plane is made in one part. The spars are glued, of two parts and of square section. The hollow sections are spindled out of the solid wood which is left at the main points. The ribs are made of 15 mm. 3-ply wood with flanges, being mounted at intervals of only 160 mm. and carefully secured to the spars by means of small glued blocks. The interior bracing of the planes is carried out with tubes and wires. The fabric is sewn to the ribs. All main spar fittings clasp round the spars to avoid weakening them by drilling.

The biplane is fitted with four balanced ailerons attached to the rear spars. They are operated by tubes inside the planes, which goes to reduce the head resistance beside reducing the engagement vulnerability as already mentioned. The tail fin is made of wood in V shape, being supported upon and mounted on a strong wooden bridge inside the tail plane and fixed with two light screws. The two supporting struts of the fin are of streamline section and hollowed.

The centre section support is cable braced, and the gun-mounting is used as part of the structure. The main wiring is by means of two cables of ample dimension to give as small an elongation as possible even at high stresses. With the object of safety, a front drift cable is further provided for long, quick nose dives.

The armament consists of two fixed machine-guns mounted in the usual way for firing through the propeller.

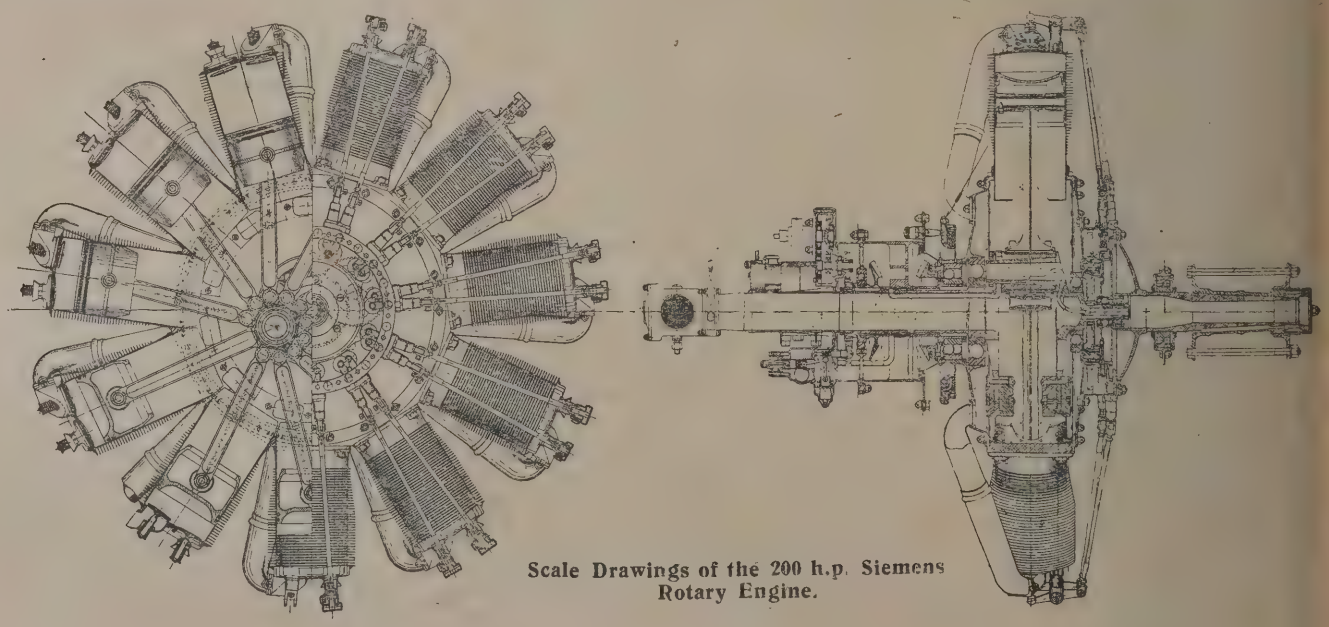
THE SIEMENS 11-CYLINDER ROTARY ENGINE.

The results of the 9-cyl. Siemens' rotary engine of 110-h.p. proving unsatisfactory, an 11-cyl. model of 220 h.p. was developed from the former. This differs from other rotary motors produced so far in that the crankshaft and cylinders both revolve in opposite directions. The cylinders turn in one direction at 900 r.p.m. and the crankshaft at 900 r.p.m. in the opposite one, which gives a total of 1,800 revs. per min., with only 900 for the airscrew, which has the effect of a good screw efficiency and goes to reduce the centrifugal force and its influences and thus to increase the reliability.

The high number of engine revs. increases the performance and reduces the motor weight. The advantages claimed for the low cylinder speed are the reduced air resistance of the rotating parts resulting in an improvement of the performance that the opposite rotations of the masses almost abolishes the gyroscopic effect improving the manœuvring qualities of the aircraft, that the fuel consumption is said to be considerably lower than in other rotaries, being equal to that of fixed motors, that the Siemens' rotary engine can be throttled from 900 r.p.m. to 350 revs.; further, that the cylinders can easily be dismantled, that the provision of two magnetos go to increase the reliability of the motor, and that the motor can be started by starting magneto.

The inlet and exhaust valves of the Siemens' rotary are operated by push-rods, and the engine is super-dimensioned to be suitable for high altitude flights. The normal output amounts to 200 h.p., the maximum one to 240 h.p., at a total weight of 194 kilos, which works out at a weight of 0.81 kilos per horse-power.

The motor, of 124 millimetre bore by 140 m.m. stroke, is suspended at three points in a malleable iron frame that is fixed with suitable stampings to the four longitudinals.



Recent models have been improved to make the quick and easy removal of the motor possible.—HI.

A NEW FRENCH AERONAUTICAL JOURNAL.

A new French monthly, known as "L'Air," has recently made its appearance.

This journal, under the management of M. G. Roche d'Estrez, deals with aviation from both the technical and the popular point of view, and appears to have received the support of a number of the leading French technical authorities.

It is excellently illustrated and well written, and it is well worth the subscription (10 francs per annum, outside of France) to all those who wish to keep in touch with French aeronautical activities. Its address is 85, Rue St. Lazare, Paris.

Scale Drawings of the 200 h.p. Siemens Rotary Engine.

To "Aeroplane" Subscribers.

HOW TO SAVE ONE GUINEA, EIGHT SHILLINGS & NINEPENCE OR SEVEN & SIXPENCE.

The subscription list of the AEROPLANE, both at home and abroad, is steadily increasing: an eminently satisfactory movement which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, M.C., A.F.C., R.A.F., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

Subscribers who take advantage of this offer will have no reason to complain of the cost of their books.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" or one year post free **(30/- inland; 35/- abroad** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

A CONFERENCE OF DOMINION METEOROLOGISTS.

During the past week there was held in London the first Conference of Representative Meteorologists from the Dominions under the presidency of Sir Napier Shaw, Director of Meteorological Office and Acting Controller of Meteorology, Air Ministry.

At the opening meeting held on Tuesday, Sept. 23rd, the delegates were welcomed by General Sir F. H. Sykes, G.B.E., K.C.B., C.M.G., Controller-General of Civil Aviation, and Sir Napier Shaw.

Colonel L. F. Blandy, D.S.O., R.A.F., then read a paper on arrangements for transmission of meteorological information by wireless. He outlined a scheme covering the whole of Europe, Mediterranean, and North Africa. In the discussion which ensued, the delegates expressed their opinions as to how far the scheme could be adopted in the various Dominions. The afternoon discussion was directed to a discussion of transmission of observations by W/T from ships at sea. The delegates then visited the wireless station at the Air Ministry.

On Wednesday morning, Sept. 24th, 1919, Squadron Leader A. D. Spiers, R.A.F., opened a discussion on the aerial routes, Cairo-Karachi, and Cairo to the Cape. The subject was discussed from a meteorological standpoint, and the delegates concerned emphasised the interest of their respective Governments in the proposed routes. Subsequently, Sir F. Stupart (Canada) raised the question of instruments and equipment for upper air observations by means of pilot balloons. A decision was also reached on the best form of report for aviation purposes. The afternoon was devoted to the selection of stations for the general study of climatology of the globe. Later, the delegates visited Kew Observatory, Richmond.

Thursday was devoted to visits to the kite balloon testing station, Kingston Hill, and the R.A.F. Meteorological Station, Bedford.

On Friday, Sept. 26th, the Conference discussed the Convention for International Aerial Navigation. It was difficult to enter into a detailed examination of the meteorological clauses of this Convention, as these had not been seen by the Dominion meteorologists before their arrival in England. Consideration of the International codes was left over for the International Meteorological Conference which started in Paris this week. On behalf of the hydrographer of the Navy, a paper on hurricanes and hurricane conditions was circulated. A considerable amount of information on this subject was already available, and it was decided that records and the reports of all hurricanes observed in the future should be sent to the Meteorological Office, London, with a view to analysis and investigation.

On the question of further co-operation on meteorological matters of the several parts of the Empire, Colonel Bates (New Zealand) proposed "that the Conference of representative meteorologists of the British Empire assembled together for the first time should agree to continue as an association for the exchange of views from time to time upon scientific matters concerning the achievements, requirements and organisation of their services." This was carried unanimously. Sir Napier Shaw was elected the first President, and members were invited to submit rules for the guidance and acceptance of the Association.

The Conference has been beneficial in bringing together the various meteorological organisations of the Empire, and it is hoped that as a result complete co-operation will be maintained between Dominions, Crown Colonies, and the Mother Country. It is unnecessary to point out the need for this co-operation in view of the development of the great aerial routes of the Empire.

The following delegates were present:—Sir Napier Shaw (Great Britain) (Chairman), Capt. A. J. Bamford (Ceylon), Lieut.-Col. D. C. Bates (New Zealand), Mr. H. D. Grant (Admiralty), Mr. H. A. Hunt (Australia), Mr. H. Knox-Shaw (Egypt), Mr. C. Stewart (South Africa), Sir F. Stupart (Canada), Dr. G. T. Walker (India), Capt. D. Brunt, of the Meteorological Office, and Capt. R. M. B. Mackenzie, R.A.F., of the Air Ministry, acted as Secretaries to the Conference.

AERONAUTICS AT THE NORTHAMPTON INSTITUTE.

It is announced that an evening course of lectures on Aeronautical Engineering is to be given at the Northampton Institute, St. John Street, Clerkenwell, during the forthcoming session by Squadron-Leader F. W. Bramwell, R.A.F.

The lectures in question are to deal with practical aeroplane design, and are intended to qualify students for positions such as that of assistant designer in an aircraft factory's drawing office.

In conjunction with the lectures there is a laboratory course in the Institute's aeronautical laboratory, which is equipped with a 4 ft. wind tunnel and other necessary appliances which will enable students to obtain a working knowledge of the experimental basis upon which the theory of aeroplane design rests.

At a similar series of lectures held during last winter it was found that a considerable number of would-be students were under the very prevalent but entirely erroneous idea that it is possible to become an aeronautical engineer without any knowledge of engineering or even of elementary mechanics and the simplest mathematics, and at the first lecture held this session, on Tuesday, Sept. 23rd, it was found that a similar misapprehension existed.

It has been pointed out in these pages on more than one occasion that aeronautical engineering is merely one specialised branch of the engineering industry as a whole, and that it is necessary to become an engineer before becoming an aeronautical engineer.

It cannot be too strongly impressed upon would-be students of aeronautical engineering that it is hopeless to attempt to acquire any useful knowledge of a specialised application of engineering—such as aeroplane design—without first acquiring a general knowledge of engineering principles, and a sufficient knowledge of mathematics to carry out the calculations involved in their application.

The attempt to do so will merely lead to the bewilderment of the student and to delay in the progress of those of his fellow-students who are reasonably qualified to benefit from the classes he is attending.

Students who wish to profit by the educational opportunities offered by such colleges as the Northampton Institute, unless they feel perfectly confident that their general engineering knowledge is sufficient to permit of their assimilating any particular course of classes, should make a point of consulting the authorities at the Institute in question. They will thus be enabled to avoid wasting their own and other people's time in attending lectures which they cannot understand.

THE USES OF CONSUTA.

Probably most people concerned with hydroplanes or with flying boats have heard of the Saunders "sewn hull" system of boat construction. When first introduced copper wire was used for sewing and was very successful, but more recently Mr. Saunders has evolved a new method of sewing with special thread which, judging by all tests, is both stronger and more reliable, lighter and more flexible, than the copper sewing. Also the new method of sewing lends itself to much more rapid production by means of machinery specially designed for the purpose.

This new sewn woodwork is known by the name of "Consuta," and it has already been used largely in the construction of flying boats. It will be remembered that in the early flying boats a considerable portion of the hull which did not come into direct contact with the sea was covered with linen fabric. Somewhat naturally it was found that linen fabric was not, after all, the best possible material for the purpose, and when Mr. Saunders began producing "Consuta" in lighter gauges these fabric sections of the hull were replaced by "Consuta," which proved entirely satisfactory.

It is now being used for the whole covering of flying boats of the largest size—in fact, of a larger size than anything which has so far been produced, and, from what one has seen, it is likely to give much more satisfactory results than any species of three-ply or other ply-wood which has yet been invented.

When in the Isle of Wight recently Mr. Saunders was kind enough to take one round his works and to show one the various uses to which "Consuta" is being put. One may not, of course, describe in detail the big boats in which it is being used, but one may say that it is also being used with great success for the skins of motor-boats.

Mr. Saunders is constructing a number of small hydroplanes of a standard type which should find a ready market. The extraordinary feature about this standard type production is that the whole boat is completed, with the exception of the installation of the power plant, before the skin is put onto the skeleton, and it strikes one at first as being quite extraordinary to see a complete new boat with all its fittings in place, but without any planking whatever.

The whole method of construction is convincing testimony to the original mind of Mr. Saunders, for there can be but very few men in any business who, with his long experience of their own particular trade, would strike out suddenly into such an entirely revolutionary method of construction.—

C. G. G.

A GERMAN AIRCRAFT WORKS CLOSING

The Danish correspondent of The Aeroplane writes:—

It was resolved to close down the Rumpler Aircraft Works, at a meeting of shareholders, as the company had been unable to find profitable after-war trade.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

GREAT BRITAIN.

THE AERIAL MAIL SERVICES.

By arrangement between the Postmaster-General and the Air Ministry aerial mail services were started between London and various provincial towns on Oct. 1st.

The first machine to leave Hounslow on that date was a Westland limousine which carried 1 lb. 1 oz. of mail to Bristol and started at 7.40 a.m., arriving at Bristol at 9.10 a.m.

An Avro, carrying 2 lb. 11 oz., left at 7.45 a.m. for Birmingham and arrived at 9.15 a.m.

A Blackburn "Kangaroo," owned by the Grahame-White Co., carrying 3 lb. 8 oz., left at 7.50 a.m. for Newcastle and arrived at 11.20 a.m.

A Blackburn "Kangaroo" belonging to the Northern Aviation Company, carrying 13 lb. 10 oz., left at 8 a.m. for Glasgow and arrived at Renfrew aerodrome at 1 p.m.

A B.A.T. commercial aeroplane, carrying 6 lb. 2 oz., left at 8.15 a.m. for Didsbury, Manchester, and arrived at 10.45 a.m.

In all, 315 letters were carried. There was accommodation for 4,750 lb. of mail.

The machines which carried the mails to the three northernmost cities, Glasgow, Newcastle, and Manchester, were scheduled to return on the day following their arrivals there. Those flying to Birmingham and Bristol were to return on the same day. The machines left at dawn. The mails were conveyed to the aerodrome on the previous night by G.P.O. vans.

Directions for the posting of the mail were stated in last week's issue of THE AEROPLANE. The mails were dispatched from the Post Offices in sealed boxes and a receipt was given for each at the aerodrome.

According to the "Daily Telegraph" of Oct. 2nd, fifty-four R.A.F. aeroplanes were employed on Oct. 1st to distribute the mails over the country.

Copies of the "Times" newspaper were delivered by aeroplane to personages of importance in the United Kingdom and abroad during the strike up to Oct. 2nd.

On Oct. 2nd 320 "letter packets" were carried by the aerial mail services. The inward mail to London from the five abovementioned cities was rather less than the outward mail. The principal contributor was Newcastle, from which centre 115 letters were sent to London.

It was estimated that the revenue from the service did not amount to one-tenth of its cost, and it was said that the service would be discontinued within this country after the normal train service had been resumed.

The first aeroplane for London carrying the Glasgow mail left Renfrew aerodrome in the morning of Oct. 2nd with a heavy bag of mails. The machine arrived in London before midday. The aeroplane which left Hounslow for Glasgow had to descend at Hendon owing to fog. A landing had to be made at Doncaster for petrol and a further stop was made at Newcastle. Owing to rain and fog, the machine stayed the night at Turnhouse aerodrome, near Edinburgh.

An R.A.F. machine, piloted by Lieut. Shepherd, with Lieut. Page, left Kenley for Newcastle at 5.37 a.m. on Oct. 2nd. The machine ran out of petrol when nearing Newcastle at 8.45 a.m. The pilot tried to make a landing in a football field, but a wing struck a building and the machine came down in a street. As a result of the accident Lieut. Shepherd had his skull fractured and broke an arm. He died later from his injuries. Lieut. Page was uninjured and delivered the mails.

An R.A.F. Bristol biplane, No. 4,577, carrying mails from Salisbury to Pembroke, made a bad landing at Llanelly on Oct. 6th. The machine was damaged, but the two aviators escaped without injury. Thousands of people visited the scene of the accident during the day.

It is stated that fifty R.A.F. aeroplanes were employed to carry the mails on Oct. 3rd. The mails were again carried to Bristol, Birmingham, Manchester, Newcastle and Glasgow by civil aviation machines. An Airco machine carried the French post to Paris and a Handley Page went to Brussels, taking the mail for Belgium, Norway, Sweden, and Denmark.

An official statement from Downing Street issued on Oct. 3rd stated that owing to the improvement in the train services it had been decided to discontinue the civil aerial mail services in Great Britain.

THE IRISH MAILS.

The Under Secretary for Ireland denied on Sept. 30th the report that an air service between England and Ireland was about to be established. A prominent official of the Post Office informed a Press representative on Oct. 1st that it was quite probable that an Irish service would be instituted, although the Department had not arrived at a decision.

According to the "Morning Post" of Oct. 1st, an air service for the conveyance of Government dispatches had been organised between Holyhead and London. It was to work in connection with the Kingstown and Holyhead mail service.

A G.P.O. official stated on Oct. 2nd that there would not be an Irish aerial mail, as official communication had been established by means of train to Bangor, motor van to Holyhead, and by boat in the usual way.

THE AIR POST STOPPED.

The Secretary of the General Post Office announced on Oct. 6th that in the altered circumstances the conveyance of mails by aeroplane between London and Bristol, Birmingham, Manchester, Newcastle, and Glasgow, had been discontinued.

ANTI-STRIKE AVIATION.

A. V. ROE AND CO., LTD.

During the week the Avros were busy helping the State and the public to tide over the strike. But booking ahead was a difficult matter, and, at one time, the Government left them to their own devices; then put on petrol restrictions; then employed some machines for the air mail; and, finally, opened all civil flying again. However, four Avros carried the "Daily Chronicle" to Cardiff, Bristol, Birmingham and Norwich for several days in succession. Matrices of the "Daily News" were taken to Manchester on two occasions. Copies of the "Daily Sketch" were taken to Weston-super-Mare, and of the "Daily Chronicle" to Cleethorpes, near Hull, and to Swansea.

To the Avros was entrusted the task of carrying the mails to Castle Bromwich for so long as the Government kept the air mail going.

IN STRIKE TIME.—Aeroplanes assembled at a London Aerodrome. These machines carried supplies of newspapers to Manchester, Plymouth, Sheffield, and Weston-super-Mare.

Several journeys were made to Manchester, one in very tragic circumstances, for two ladies had to attend a funeral there and could not have arrived in time by any other means.

Other cross-country journeys were to Rugby, Eastbourne, Gloucester, Stroud, Oxford and Saffron Waldon.

THE BRITISH AERIAL TRANSPORT CO., LTD.

The B.A.T. Co.'s emergency aeroplane service from London to Birmingham was flown on Sept. 30th for the last time. A machine left Hendon at 10.45 a.m. piloted by Mr. Cyril Turner. Castle Bromwich Aerodrome, Birmingham, was reached just before noon. The return journey was started at 1.5 p.m. and the machine reached Hendon at 2.10 p.m.

The machine started on its second flight at 3 p.m., piloted by Major C. Draper. Birmingham was reached at 3.45 p.m., and the machine left there again at 4.15 p.m. and arrived at Hendon at 5.20 p.m. The company announced on Sept. 30th that owing to the Government requiring their commercial aeroplanes for mail service, the service to Birmingham has been discontinued, and will not run until further notice.

THE NIEUPORT AND GENERAL AIRCRAFT CO.

Two Nieuport two-seater "Nighthawk" biplanes were on the Hendon aerodrome on Oct. 1st. They were ready to carry the mail to Dublin and Edinburgh. The machines and their pilots were held in readiness for Government service.

THE SUPERMARINE AVIATION WORKS, LTD.

On Saturday, Sept. 27th, despite the strike, thousands of copies of the "Southern Daily Echo" were delivered to Bournemouth. The proprietors of the newspaper arranged with the Supermarine Co. that one of their flying-boats should carry the copies. The service was carried out quickly and smoothly and showed the possibilities of the flying-boat for commercial use.

The flying-boat received the cargo of news at 6 p.m. and, piloted by Cmdr. Hobbs, D.S.O., D.S.C., the machine set out for Bournemouth. The weather was fine, and at about 6.43 p.m. the machine flew into the bay and alighted east of Bournemouth Pier. The papers were taken to the shore in several rowing boats.

The flying-boat service from Woolston (Southampton) to Le Havre was started on Sunday, Sept. 28th. Shortly after 5 p.m. two machines left for France, each carrying a couple of passengers, with luggage. The boats became separated in a storm, but both reached their destination safely. On the return journey one flew straight back to Woolston and the second landed at Bembridge, Isle of Wight, to fill up with petrol. It reached the sheds a little later.

On Monday, Sept. 29th, two flying-boats left for Le Havre at noon, and in addition to carrying passengers they bore mails. Amongst the contents of the mail-bag were several interesting letters, including a message of greeting from the Mayor of Southampton to the Mayor of Le Havre, another from the President of the Southampton Chamber of Commerce, a third from the French Consul, and a greeting from the editor-in-chief and general manager of the "Southern Daily Echo" and its allied journals to the editor of the "Journal du Havre."

The letter which the Mayor of Southampton sent to his Worship of Le Havre was as follows :—

My dear Sir, — I wish on behalf of the people of Southampton to extend to you and the inhabitants of Le Havre our most cordial greetings upon the inauguration of this, the first, public aerial service between any English port and French port. The boat service between Le Havre and Southampton has been established for a long period, and has had, and I hope will continue to have, a remarkably successful existence, and this strong link between our two towns is further increased by this establishment of the flying-boat service, due to the enterprise of a Southampton firm, the Supermarine Aviation Company, by whose courtesy I am sending this letter through the agency of one of the initial flying-boats.

It may be, Mr. Mayor, that time will prove that this aerial service between our respective ports will become a necessity, and grow into one of very great importance.

With all good wishes,
Yours very sincerely,
(Signed) S. G. KIMBER, Mayor.

According to the "Daily Telegraph," of Oct. 1st, one of the machines which flew to Le Havre on Sept. 20th returned to Newhaven in the evening with a passenger. As it was too late to fly home the pilot stayed the night there and came back the next day.

On Sept. 30th another flying-boat was sent to Le Havre with two passengers and their luggage.

VICKERS, LTD.

An aeroplane mail service was opened on Oct. 1 by Vickers, Ltd., between their head offices in London and the Naval Construction works at Barrow. An aeroplane piloted by Lieut. Simpson (late R.A.F.) arrived at Walney airship station in the morning with letters from London and Sheffield. After lunch the pilot flew back to London. The service is to be flown daily. Vickers, Ltd., are willing to take urgent messages from Barrow people to London by the service.

A small airship, in the service of the Royal Navy, stationed at Barrow, has been lent to Vickers, Ltd., in connection with their aerial mail service between Barrow and London. Mails have been carried by this ship to Sheffield and thence by aeroplane to London. Vickers, Ltd., have also carried urgent letters from London to Barrow for local people.

OTHER NEWS

A number of ex-Royal Air Force wireless operators have volunteered at the Air Ministry for service. These are being placed as quickly as possible.

On the special official service arranged for Paris, two machines left carrying five passengers and 150 lb. of mail on Sept. 30th.

Over one ton of newspapers was delivered by air on Sept. 30th. The papers were flown from London at dawn to Bristol, Birmingham, Cardiff, Norwich, etc.

The Right Hon. H. A. L. Fisher, Minister of Education, flew from Sheffield to London on Sept. 30th to attend a meeting of the Cabinet.

Arrangements were made to transport the artists in touring theatre companies last week-end by aeroplane.

THE CONTINENTAL SERVICES.

A LONDON-HOLLAND AIR SERVICE.

The British Aerial Transport Co., Ltd., arranged to start a service to Holland on Oct. 7th. The machine, a B.A.T. FK26 commercial biplane, was due to leave Hendon at 11 a.m. for Hounslow, where the Customs formalities are observed.

The aeroplane was scheduled to leave Hounslow at 11.30 a.m. with a cargo of Emaillite Dope. The journey to Soesterberg aerodrome, near Amsterdam, is expected to take three hours.

The return journey will be made every Wednesday, and the machine will leave Amsterdam at 11.30 a.m. This week four passengers have booked seats from Holland. There is a waiting list for the service at both ends of the route.

As soon as the demand merits it, the service will be run more frequently. The FK26 can carry four passengers or 1,000 lb. of goods, and has a cubic capacity of 140 cubic ft. Passages may be booked at the offices of the company at 38, Conduit Street, W.1, from which address a car will leave for the aerodrome every Tuesday at 10.15 a.m.

THE STRIKE-SERVICE.—The Airco D.H.10 machine which Capt. Gathergood flew to Newcastle in 2hr. 10 min. on Sept. 30th, loading up previous to the start.

READY THIS WEEK. *Price 3/- net, 3/3 post free.*

Special Missions of the Air.

By JACQUES MORTANE.

A novelty among War Books.

During the war mention of Special Missions was forbidden.

To tell anything about them would convey valuable and even vital information to the enemy.

What was a special mission?

An "ingenious but most perilous sport," says Jacques Mortane.

It consisted in the landing by aeroplane of spies behind the enemy lines.

The adventures were of the most thrilling description, and the heroes of them went unrecognised by the man in the street.

Extract from Chapter I.

"The 'ace' of the special mission was generally a man celebrated in other branches of aviation, but these men were not always recognised according to their deserts during the war. They were only known to the commanders, and sometimes—in the case of popular heroes—they were traduced by the crowd which grew indignant at hearing nothing of its peacetime idols."

In the thirteen Chapters of this book the author, writing from authentic records, describes this phase of secret service and shows how the enemy was outwitted and outplayed, albeit often at heavy cost in precious lives.

Order of your bookseller or direct from the publishers,

THE AEROPLANE & GENERAL PUBLISHING CO., Ltd., 61, Carey Street, W.C 2.

SECOND EDITION. *1/- net, 1/3 post free.*

The Revelations of Roy (With apologies to Artemas.)

"Hearken unto the revelations of Roy, and profit thou by his experiences."—*"The Revelations of Roy," XXI. 2.*

Extract from Chap. II.

1. And when he was come unto Farn, Roy was compassed about by a great multitude.

2. And he beheld winged chariots of divers designs; thus there were the Scout, and the Dolphin, and the Martinsyde, and the Camel, even that which produceth the hump.

Extract from Chap. XXI (and last).

17. And in all thy ways consider this, that there be two things greater than any other in forming the character of him that flies; and the one is Energy and the other, it is Enthusiasm.

19. And take thou a pride in being an aviator; for hath not the great Hender said, These young men are the salt of the Earth.

20. Go thy way in courage and good cheer; and greet the Great Adventure with a song.

Other books published by The Aeroplane and General Publishing Co. are indicated in the order form attached. Price covers postage. Strike out those not wanted.

The Handley Page Continental Services.

On Sept. 29th, 30th, Oct. 1st and 2nd Handley Page Transport, Ltd., on their London-Paris and Brussels Air Services carried eighty-six passengers, two tons of freight, and three and a half tons of mails, which is roughly 250,000 letters.

There is great difficulty in getting the machines from Brussels and Paris off to time. Besides the Customs formalities, the excitable Belgian and French people will fight for the front seats. In addition, they will not enter the machines until they have made exhaustive inquiries as to the position of the lavatories and the saloon bar, which they firmly believe is carried on every Handley Page.

Owing to a printer's error, the single fare in a Handley Page machine to Paris or Brussels was quoted at twenty guineas. The fare is, in fact, fifteen guineas.

In the table of the London-Paris and Brussels air services last week it was stated that a Handley Page machine, on Sept. 24th, left Hounslow at 10.30 a.m. and arrived at Brussels at 3 p.m. Owing to the amount of additional flying then being done by the Handley Page Transport, Ltd ., on account of the strike, they were unable to check the times of their machines with those which The Aeroplane had received from other sources. They have now stated that that machine left Cricklewood at 10.30 a.m. for Hounslow. The journey to Brussels was started from Hounslow a few minutes after noon.

The Airco London-Paris Air Service.

Date.	Type.	Pilot.	Left Hounslow	Arr. Paris.	Left Paris.	Arr. Hounslow.	Pass.

Oct. 2nd	D.H. 9	Lt. Shaw	1.0 p.m.	3.25 p.m.			2
	D.H. 16	Lt. Powell			11.30 a.m.	2.40 p.m.	4
	D.H. 16	Lt. Chattaway			11.50 a.m.	2.41 p.m.	4
Oct. 3rd	D.H. 4a	Capt. Baylis	12.53 p.m.	3.10 p.m.			1
	D.H. 4a	Capt. Courtney			11.30 p.m.	2.0 p.m.	2
Oct. 4th	D.H. 16	Lt. McMullin	12.50 p.m.	3.20 p.m.			4
	D.H. 9	Lt. Shaw			11.30 a.m.	2.20 p.m.	2
	D.H. 4a	Capt. Baylis			11.30 a.m.	1.55 p.m.	2

With reference to the above table of flights, on Sept. 30th the D.H.4a, piloted by Lt. Shaw, which left Paris at 11.45 a.m., carried Maj.-Gen. Sir F. Sykes, K.C.B., C.M.G., and his secretary as passengers.

Express parcels were taken in every machine except in that on Sept. 29th, which carried the Government mails. On Oct. 1st the "goods" carried to Paris included a pedigree blue Persian kitten which was consigned to a lady in Geneva.

On Saturday, Oct. 4th, the Airco London-Paris Service completed its sixth week of continuous operation.

Although the weather was unfavourable on twenty-eight days, eighty-three flights have been accomplished out of eighty-six scheduled. As a proof of the reliability of aeroplanes nowadays, during the 20,750 miles of flying, only once has a pilot been forced to alight through mechanical trouble.

Mr. Holt Thomas said recently, "This service is the first link in a European chain of 100 miles an hour aerial ways. Before long we shall be able to save not merely hours, but days, in the transport of letters from London to some of the great Continental cities."

London.

Hendon.—Sir James Purves Stewart, a Harley Street specialist, recently flew from Hendon to Leicester in a Grahame-White aeroplane, to perform an operation. It is understood that his nerve was unaffected.

Hounslow.—On Sept. 30th Capt. Gathergood (late R.A.F.), piloting an Airco D.H.10, flew to Newcastle with a load of newspapers. Newcastle was reached in 2 hours 10 min. The return journey took 2 hours 50 min.

On October 2nd Capt. Gathergood, piloting an Airco D.H.10, left Hounslow at 1.15 p.m. for Renfrew on Government mail service. He arrived at Renfrew at 6 p.m.

On Oct. 3rd Capt. Square (late R.A.F.), piloting an Airco D.H.9, left for Paris *en route* for Madrid at 12.15 p.m. and arrived at Paris at 2.45 p.m.

On Oct. 4th Maj. Stuart Wortley, piloting an Airco D.H.4a, arrived at Hounslow at 4.35 p.m., having left Interlaken, Switzerland, at 11.15 a.m.

Hamble.

About 30 little brothers and sisters of the famous Avro "Baby" are soon to make their appearance in the world. Flying men do not need to be reminded of the original "Baby's" triumph in the Sealed Handicap of the Aerial Derby, of other wins at Hendon, and of the sensation it created at Amsterdam. But 25 miles on the gallon of petrol at 70 m.p.h. are figures to give food for thought to business men who have mastered the art of flying, especially in view of the recent transport upheaval. It would be interesting to have a peep at Sir Philip Sassoon's diary during the past 10 days.

Southampton.

An Avro seaplane, carrying newspapers from Southampton to Guernsey, was wrecked in a fog behind a breakwater off Alderney on Oct. 5th. The pilot, Capt. Evans, was rescued.

Warrington.

The Golden Eagle Aviation Co., Ltd., sent two D.H.6 machines from St. Annes-on-Sea for the Warrington Flying Week. Mr. H. W. Griffin, the hon. secretary of the Infirmary Fund, arranged the Flying Week, which started on Sept. 25th.

For one guinea the passengers were taken for quite lengthy flights, and the aviation company only received one half of each guinea. The other ten and sixpence went to the Infirmary £10,000 Fund, and Mr. Griffin fully expected that it would be wiped off before the end of the week.

The first passenger to be taken up was Alderman Bennett. Lady Grenall also had a flight. Tickets for free flights were offered to all residents of over seventy years of age, and at least two took advantage of the offer. The flying took place from a newly licensed field in Chester New Road.

A charge of twopence was made for admission to the ground, and a body of stalwart men in blue kept the crowd back. Refreshments were served in two marquees.

The managing director of the Golden Eagle Aviation Co., Ltd., is Major H. S. Shield, who flew over to Warrington from St. Annes-on-Sea. Capt. Hedges, also of the company, took many passengers up during the flying week.

INDIA.

The Government of India has sent a circular to the Chambers of Commerce proposing that there should be seven maintenance centres for aeroplanes within the Government's jurisdiction. They are Bombay, Calcutta, Madras, Karachi, Delhi, Nagpur and Rangoon. It is believed that these centres will be sufficient for all probable air routes in India and Burma. They will also enable every advantage to be taken of the speed and range of air transport.

The Government also state that after taking the best technical advice, they believe that civil aviation will best be encouraged by the grant of an air mail-carrying monopoly to one company for a term of years. Other companies would be able to enter into competition for other transport than that of mails.

The policy at present outlined is for inland aviation only. The Government is waiting to see the result of long-distance flights before proposing anything for the carriage of mails between India and Europe.

CHINA.

Lieut. E. C. Ricou, a pilot in the French Army Air Service, visited the Aero Club of America on Sept. 14th. He has been chief of the French Air Forces operating in China. In addition to being an aviator he is an engineer, and has been prominent in starting large electric and water companies.

He is financing his aviation enterprise himself. Lieut. Ricou intends to start a commercial aerial route between Shanghai, Hong Kong, Haifung, Canton, Tonkin and Maçao. Passengers and light freight will be carried.

During the war Lieut. Ricou saw extensive service in the French campaign in Salonica and was shot down and wounded three times. After he had been ordered to China he was responsible for the crushing of a local rebellion which had been actuated by German influence

FRANCE.

The Salon de l'Aeronautique.

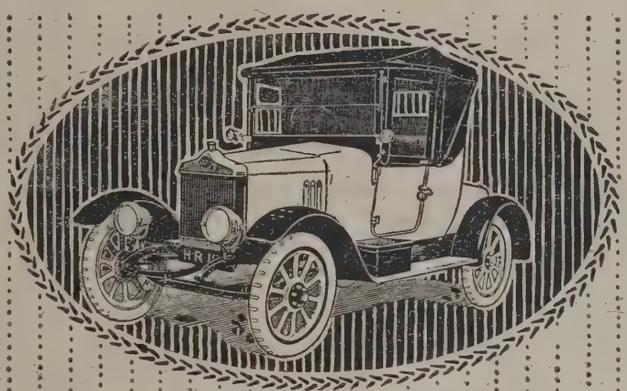
Among the British firms who will exhibit at the Salon de l'Aeronautique, which opens on Dec. 19th next, are the Aircraft Travel and Transport, Ltd.; Westland Aircraft Works, Ltd.; Boulton and Paul, Ltd.; Vickers, Ltd., and Handley Page, Ltd.

The Italian aeroplanes and seaplanes to be shown are the Ansaldo, Fiat, Macchi, Alta Italia, and Caproni.

To All Users of Motor Spirit

There are adequate stocks of Motor Spirit in the country to meet ALL requirements.

In the absence of railway transport the difficulty is to get the motor spirit into the hands of those that need it for food distribution and other essential national needs.



The Distributing Companies are confident that this can be done with the co-operation of the public and the trade.

The distribution by motor spirit transport to garages, etc., must be discontinued, all such motor transport being required for the purposes already indicated.

Dealers and commercial consumers requiring motor spirit must therefore call at the local depots of the Distributing Companies and bring with them all empty packages available, as supplies of full packages will be limited to the number of empties returned.

The hoarding of motor spirit, or the use of it by those who do not really require it during the railway strike, is contrary to the public interest.

The Distributing Companies much regret the inconvenience caused, which they hope will not be of long duration.

The All British
Standard Light Cars

"SPECIALLY DESIGNED FOR THE OWNER DRIVER"

His Standard of Comfort, Economy, Stability, Easy Control & Ample Power.

THE STANDARD MOTOR CO., LTD., COVENTRY.
London Showrooms: 49, PALL MALL, S.W.1.

Godbolds.

The following motors from various countries will be exhibited: Lorraine-Dietrich, Gnôme-Rhône, Anzani, Panhard-Levassor, Renault, Clerget-Blin, Salmson, Peugeot, Fiat, Isotta-Fraschini, and Spa.

The Height Record.

The "Commission Sportive" of the Aero Club de France homologated on Oct. 3rd the height record gained by Casale. The height given is 31,230 ft. It is not clear whether or not this is claimed as a world's height record. In any case, it has still to be homologated by the Federation Internationale Aéronautique. Greater heights have been attained lately in America, but have not so far been homologated.

An Attempt on the Speed Records.

M. Sadi Lecointe on Sept. 29th, at Villacoublay, made several attempts on the world's speed record. Flying a single-seated Spad-Herbemont at 5.40 a.m. he made four flights over a five-kilometre course at a mean speed of 167.7 miles an hour. He then flew a two-seated Spad-Herbemont biplane with Bernard, his mechanic, as passenger (his weight is 180 lb.). His mean speed was 133.3 miles an hour.

Later in the day, when the wind had dropped, M. Lecointe flew over the same course on a single-seated Spad-Herbemont at a mean speed of 184 miles an hour, and on a two-seater with M. Bernard as passenger at 175 miles an hour. These two speeds, if homologated by the F.A.I., will constitute world's speed records.

These attempts were controlled by the technical section of the Aeronautical Service.

One congratulates M. Herbemont on the performance of these machines, and it is to be hoped that he is in some way consoled for his ill-fortune in connection with the Schneider Cup race.

A New Aerial Mail Service.

It is reported that a direct postal air service between Paris and Kieff, the capital of the Ukraine, was due to start on Oct. 5th.

A New Caudron Biplane.

On Sept. 27th M. Pierre Chanteloup carried out tests of a new small Caudron biplane. In general appearance it resembles the large two-engined Caudrons, and its landing chassis is not unlike that of the standard Avro biplane. It is fitted with an 80 h.p. Le Rhône engine. The trials were satisfactory.

From Paris to Vittoria.

M. Fronval, on a Morane-Parasol monoplane (110 h.p. Le Rhône), and M. Bourgeois on a Morane-Parasol monoplane (80 h.p. Le Rhône), left Villacoublay at 9 a.m. on Sept. 24th with the intention of flying to Vittoria. They both landed at Angoulême to refill with petrol. M. Bourgeois was unable to restart, owing to lack of petrol, but M. Fronval continued his journey, reaching Vittoria at 1.40 a.m., thus having covered 480 miles in 4 hr. 40 min., including the stop at Angoulême. M. Bourgeois followed him to Vittoria on Sept. 27th. These pilots made a series of flights at Vittoria before the King of Spain and large crowds on Sept. 30th.

They intend to make exhibition flights near various cities in Spain.

The Paris-Melbourne Flight.

M. Etienne Poulet, whose Caudron biplane is now ready, is now only waiting for further permits from the British Government, before beginning the flight. He has purchased this machine at his own expense, and is not financed in any way by Government or private enterprise. He had put two extra tanks in the machine, and will thus be able to carry 121 gallons of petrol.

During the flight he expects to use 2,150 gallons of petrol and 500 gallons of oil. The longest sea crossing will be about 520 miles in length, and the total duration of the flight from Paris to Melbourne is expected to be about 200 hours. The total distance over the route selected by M. Poulet is 13,300 miles.

With him he takes food sufficient for four days, two carrier pigeons, rifles and revolvers.

A correspondent writes:—

Lack of Supervision.

In France, there are no "ground engineers" to control the proper condition of machines before leaving the ground, and the result is a constant series of small accidents, which would be easily avoided with proper maintenance. The propeller bolts breaking on a well-known passenger machine on two occasions recently, provide a typical example.

One company here is providing an excellent example, and that is the "Société de Transports du Sud-Ouest." They run their enterprise with the precision of a military squadron, and change their motors every 50 hours. The result is that they have operated the whole summer without a single accident.

The Cup Deutsch.

The Deutsch Cup is being put up for competition again, and the race will take place on Oct. 13th. A Nieuport 29, with 300 h.p. Hispano-Suiza engine and a Nieuport monoplane, with 180 h.p. Le Rhône, have been entered. Both of these machines have had their wings clipped, bringing the total loading up to about 60 kilos per square metre.

M. Malard, who fell into the Channel when crossing for the Schneider Cup, is the pilot for the Nieuport 29, and M. Jensen is the pilot for the monoplane. M. Sadi Lecointe has entered the Spad 21 with clipped wings, with which he made the air speed record of 288½ kilometres per hour on Tuesday.

The Winter Season.

All the Air Transport Lines operating from Paris towards the North are closing down at the end of October.—J. S.

A Colonial Effort.

According to the "Times" of Sept. 25th two French aviators are to make prospecting flights from Dakar to Timbuctoo, and from Dakar to French Guinea and back.

HOLLAND.

An Avro Circus.

After the close of the E.L.T.A. Exhibition (is it a redundancy to add the word "Exhibition?") on Sept. 14th, three Avro three-seaters and one five-seater flew to Ockenbury, near The Hague. The pilots were Messrs. W. G. R. Hinchliffe, D.F.C., A.F.C., D. Shanks, F. P. Adams, and Smith. There they again found a bad aerodrome, and did not enjoy the best of weather. They stayed there, however, for the 26th, 27th, and 28th Sept., took up passengers, and did quite well. The Avro is already accepted in Holland as, *par excellence*, the machine for pleasure flying.

They next proceeded to Middelharnis and operated there on Oct. 3rd and 4th. This town is a charmingly picturesque capital of an old-world Dutch island, and, as someone remarked, it seemed sacrilege for such a blatantly modern invention as an aeroplane to break on its mediæval calm. Passengers in wooden clogs and flying helmets typified the paradoxical situation. However, the rustic Hollander took to the air as readily as Van Tromp and de Reuter took to the water. The short meeting was a great success, and the enthusiasm of the people was unbounded. All the pilots were garlanded *more Indico* with really beautiful wreaths of roses and other flowers.

The Hollanders throughout were charming hosts, and it was noted that at the E.L.T.A. Herr Fokker seemed to wish to wipe out the memory of certain regrettable incidents in his past career.

But in the Netherlands, as elsewhere, the grumpy farmer provides occasional comic relief. Once Mr. Shanks had a forced landing in a meadow, put things right himself, and flew away. Later, a letter was received from the farmer, backed by the local burgomaster, complaining that in the field there had been a horse which was so frightened by the engine that it had since nearly had an accident. Likewise, two cows had given less milk since the occurrence, and the farmer felt morally convinced that their calves would in consequence be born dead. He thought that 200 guelders (about £20) would no more than meet the moral and material damage.

The three three-seaters flew back to England on Oct. 5th. They carried extra supplies of petrol, landed on the beach at Calais and filled up their own tanks. At Calais they found many disconsolate soldier-men hung up by the strike and unable to spend their leave at home, who piteously begged for "a lift." The mist hung low over the Channel and over Kent, and the last stage of the journey was an anxious time for the pilots, but they felt their way round the hills and arrived safely.

The actual flying time for these three machines on their journey home from Amsterdam was 3 hours 30 minutes.

The pilots are returning by boat to Holland to use the other Avros which are over there to give the Hollanders little more enjoyment—and incidentally to revel themselves in unrestricted butter and sugar.

Memories of E.L.T.A.

Mr. W. R. Kenworthy, the Blackburn test pilot, has returned recently from the Amsterdam Exhibition, where he has been taking up passengers in a Blackburn "Kangaroo" machine for six weeks. His views of the Dutch people and of the Exhibition are interesting, and are as follows:—

The Hollander's enthusiasm for the E.L.T.A. was enormous. They have seen little flying during the war. All classes patronised the show, and more passengers were taken up than even the most sanguine hoped for. The millionth visitor passed the turnstile a few hours before closing time. The Dutch are very good sportsmen and very open-handed. In fact, those at the E.L.T.A. were very much like an English crowd at a 1913 aviation meeting in this country.

THE STEEL FOR BRIGHT PARTS.

Plating is now out of date for parts which are liable to rust.

Parts may be left as finish-machined, and will stay bright where other steels will rust. At the same time superior strength is gained, resulting in reduction of weight if

517A.

A Blackburn Kangaroo, with Mr. Kenworthy as pilot, at Amsterdam.

The Netherlands Court and Government also showed great interest. The Queen, the Prince Consort, and the Queen-Mother visited the show, and the Services were very much in evidence. Mr. Kenworthy had the honour of giving the Secretary of State for War his very first flight—incidentally, the only one he had time to take.

The Blackburn record at Amsterdam has been most satisfactory. Three "Kangaroos" have been out there, one for six weeks, one for a fortnight, and the third for a short week, piloted respectively by Messrs. Kenworthy, Woolley and Veale. They have had no accident either to machine or passengers, and have carried 1,400 paying passengers (roughly, 40 per cent. of the total paying passengers taken up by the 32 machines flying there), as well as numerous complimentary passengers. On their record day they carried 90, of whom 75 were revenue passengers. This was a record for the whole show. Everyone liked the machine, and many had repetition flights.

While the passengers were in the air they showed absolute lack of nervousness; they stood up, tried to talk up wind, and hung overboard to a ghastly extent. On one occasion Mr. Veale found the whole crowd standing up, so he locked the controls, turned round, and had a good chat. Perhaps his testimony to the machine is most valuable, because until the day before he flew to Holland, he had never been in a "Kangeroo," and was by conviction a small-machine man. That day Mr. Veale took a short run round, and the next day put off from Brough with his wife, luggage, mechanics, etc.

In all, Mr. Kenworthy covered 8,000 miles. He would have done a good deal more had not the aerodrome sand necessitated a five days' stop owing to the covering of the airscrews suffering from attrition. He regarded his run home as one of the best performances—three hours from the E.L.T.A. to Lympne and two hours from Hounslow to Brough, with a consumption of only twenty-five gallons per hour for the two "Eagle" Rolls-Royce engines.

Financially, the Blackburn Co. are very pleased with the expedition. The receipts and expenses on the first two machines showed such a favourable balance that they judged it worth while for the third machine to go out and back for a bare week's work—and it was worth while, even after allowing an ample overhead figure. Mr. Kenworthy thinks that the Blackburn Co. were the only people to make an actual profit all in; but, of course, this is only an estimate.

A German Effort.

The following advertisement from the Dutch Press may be of interest to the British aerial transport trade :—

> Leaving on October 2nd, the large
> Air Limousine,
> in which are places for five passengers, from the E.L.T.A. ground to Berlin. Departure 9 a.m. Price, 3,780 marks per person.
> Apply to Hôtel des Pays Bas, Amsterdam (Deutsche Luftreederei), (German Air Service).

ITALY.

The Italian correspondent of The Aeroplane writes :—

The Rome-Tokio Flight.

It is announced that Lieut.-Col. Ernest La Polla, one of the best-known pre-war pilots, and an intimate friend of the poet-soldier, Gabriel D'Annunzio, has consented to take command of the Rome-Tokio regularity flight in the place of the latter, who has been quoted as saying that it was merely as a blind that he accepted the Government's invitation to run the affair.—T. S. H.

The Pensuti Triplane.

I learn that the Pensuti triplane is to be built by Ernesto Breda and Co., at Milan, who built the small Ardea biplane.

A Waterplane Meeting.

The National Aerial League's fête at Como has been suspended by the Government. It is hoped that the proposed waterplane meeting may be held which is arranged for the end of September or early October on Lake Como. Signor Janello is to fly at the meeting, and the Powers that govern are to assist.

The Aerial Mail Services.

The "Corriere della Sera" announces that the newspaper aero-mail from Milan to Rome and the inland Sardinian mail are no longer working, though the suspension is, it is hoped, only temporary.

The following further details of the Vickers "Vimy" crash have been received from the Italian correspondent of The Aeroplane :—

On Sept 28th a Vickers "Vimy" No. 1,622, en route for Cairo, without any warning landed at the Vigna Valle (dirigible school of aerial gunnery camp), near Rome. Capt. C. H. Darley was the O.C., with four people on board.

Later on, with three of these four up, the machine left for Rome (Centocello) and flew against a tree, which it transported 100 metres, till fire broke out and the machine crashed. The C.O., bravely sticking to his post, became a victim of the fire, the two others threw themselves out of the machine, Lieut. Curtis being badly hurt, and Airman Holton undamaged. The former is at the Ospedale Civico at Bracciano, Rome.—T. S. H.

SWEDEN.

The Danish correspondent of The Aeroplane writes :—

Under the name of P.O. Flying Company and under the management of the Swedish Lieut. Per Oscar Hirrström, four British flying officers have, during the past summer, carried out a successful passenger joy-ride and stunt exhibition in Sweden with two 110-h.p. Le Rhône Avros and one De Havilland. They are Major H. Rally Johnston, Capt. K. Saunders, and Lieuts. Philips and May. They have inspired so much confidence since their start in July last that more aeroplanes are to be acquired, and a large flying-school is to be opened at Stockholm, according to the "Swedish Motor News." So far the following provincial Swedish cities have been visited: Upsala University town twice, Västerås, Arboya, Köping, Orebro, Eskilstuna, Norrköping, Göteborg, Gäfle, and Falun. —E. H.

SPAIN.

The International Air Convention.

Spain is the first country to put this into operation, and the authorities have arrested several French pilots this week because the papers for their machines were not in order.

SWITZERLAND.

The Aerial Post.

The Swiss aerial post which should have ended on Oct. 1st is to be continued until the end of October. It is thought that this service will be undertaken by a private company.

An Altitude Record.

The Swiss aviator, Prongin, accompanied by M. Haefeli, broke the Swiss altitude record by rising to a height of 7,250 metres on a Haefeli biplane.

Mr. Bradley, who arrived in Lausanne recently to take over the technical direction of the Avro school at that place, has been forbidden to fly by the Swiss Government. No reasons are yet known for this order.

An Aerial Service.

The Italian correspondent of The Aeroplane writes :—

The municipal authorities of Locorno, close to the Italian-Swiss frontier, are considering, in conjunction with a Swiss aerial transport company, the organisation of an aerodrome on the Maggia delta, close to the town. The running of a "Zeppelin" service between Germany and Italy is said to be the reason thereof. Possibly a Zeppelin-built aeroplane service is meant.

Continued mention of some such service is rife, and a descent on the Lombard trading centres is only too likely, considering the Hun interests in the district.—T. S. H.

UNITED STATES OF AMERICA.

The New Use for Flying Boats.

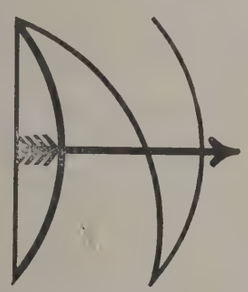
THE TIELOCKEN
AIR-WARM

Tielocken Air-Warm.

A smart and thoroughly serviceable flying coat that, made in exclusive Burberry cloth—the same as chosen by Sir John Alcock for his Transatlantic Flight—lined throughout with lightweight fur, provides Pilot or passenger with an impregnable safeguard that ensures depenable protection, warmth and comfort under the severest conditions.

The materials are especially woven for air work, and withstand intense pressure from wet or wind without the aid of rubber or other air-tight agents, which, by preventing hygienic ventilation, induce condensed moisture and consequent injury to health.

The Tielocken Air-Warm by means of overlapping fronts, doubly shields every vital area of the body. Another advantage is its unique method of fastening, which consists solely of a strap-and-buckle—no buttons to fasten or lose.



Flight or Mufti Kit to Order in 2 to 4 Days or Ready-to-Wear.

Illustrated Catalogue & Patterns Post Free.

Every Burberry Garment is labelled "Burberrys."

BELFAST.

ROACH ROAD WORKS, OLD FORD, LONDON, E.

cut at sea from New York, and dropped a mail pouch on the deck. General John J. Pershing was on board the liner and received his important letters and the morning news several hours before reaching the port on his journey from Europe.

A Big Passenger-carrying Machine.

The first Lawson Air Liner, which is said to be the first multi-motored passenger-carrying aeroplane with an inclosed cabin to attempt a cross-country flight in the United States, has recently made a journey from Milwaukee to New York.

The machine started from Milwaukee for Chicago in August. It continued to Chicago and Cleveland. At Toledo the machine was delayed by slight damage caused by it grazing the branches of a tree. It then flew to Buffalo and Syracuse, where a bad landing was made, necessitating a 10 days' stop.

The aeroplane left Syracuse on Sept. 13th with Mr. Alfred W. Lawson as pilot, with an assistant pilot, three mechanics and four passengers. According to the "Aerial Age" of America it reached Mineola, 312 miles away, in 2 hrs. 47 min. The speed averaged was, therefore, 112 m.p.h. The passengers played bridge in wicker chairs.

On Sept. 15th 12 passengers, mostly newspaper reporters, were flown from Mineola to New York.

Hunting with Aeroplanes.

Enthusiastic sportsmen in the Adirondacks think that aeroplanes will soon be used in connection with hunting in the mountains there. It is said to be probable that one of the aeroplanes which has been conveying passengers on sight-seeing trips near Lake Placid will be tested shortly with a view to determining its use in locating the haunts and feeding grounds of deer.

Aerial Police Protection.

When the Boston Police Force threatened to strike recently, the manager of the Curtiss Aeroplane Company, of New England, offered the services of his pilots and aeroplanes for aerial police protection. The "Aerial Age" states that it is probable that Boston will soon establish an aerial police department.

Aerial Taxies.

A seaplane made the first metropolitan aerial taxi trip on Sept. 14th. The passengers were a dancer, a reporter, and a dog mascot of the New York Sight-seeing Aero Taxi Company. The fare charged is a dollar a minute, not including war-tax. This strange "taxi" landed its "fares" at the same point from which it picked them up.

Aeroplanes for Business.

Mr. S. E. J. Cox, of Dallas City, Texas, has purchased a Curtiss J.N. biplane. He is an oil-promoter, and has bought the machine for travelling to his various oil wells and refineries, and for advertising purposes. Mr. Cox has purchased also a Curtiss "Oriole" for his own use.

Two Curtiss Agencies.

Mr. William Blair, the manager of the Curtiss agency at Detroit, Mich., is making a flight from Chicago to Detroit in a Curtiss "Sea Gull." He will visit several customers and prospective customers on his journey.

A new company has been formed in San Francisco, named the Earl P. Cooper Co., to act as distributors for Curtiss aeroplanes in the northern half of California and in Nevada. The "Aerial Age" states that a flying school and a number of aerial transportation lines will be operated by the company. Curtiss "Orioles" and "Sea Gulls" will be used. Earl Cooper is a well-known automobile racing driver.

The New York-Toronto Race.

The winner of the reliability test in the International Air Derby has been declared. He is Major R. W. Schroeder, and he flew a Vought V.E.7 fitted with an 150-h.p. Hispano-Suiza engine. In the actual speed contest, noted in last week's issue of The Aeroplane, he was ninth.

In the reliability contest the second, third and fourth places were obtained by Curtiss J.N.-4H machines, and the fifth by a J.N.-4D. The Liberty-engined D.H.4 machines were mostly placed about the middle of the reliability table. Lieut. B. W. Maynard, the winner of the speed contest, was placed ninth, as his machine, a D.H.4 fitted with a 400-h.p. Liberty engine, was very lightly loaded.

The system by which the reliability handicaps were worked out is as follows: The machine's possible useful load was multiplied by its still air speed and divided by its horse-power. This gave an index number showing its ideal performance. By multiplying its actual useful load by its actual speed in the race and dividing that by its horse-power an index number was produced showing its actual performance. The ratio of the index number of the actual performance to that of the ideal performance was then brought to a percentage and the position of the machine in the reliability contest was determined.

The cash prizes for reliability, including the 10,000 dol. given by a hotel syndicate, are to be divided among eight of the nine civilian pilots who completed the course. Even Lt.-Col. W. C. Barker, V.C., D.S.O. (late R.A.F.), who, flying a Fokker, was last but three in the speed contest and last of all in the reliability contest, will receive his share.

Enthusiasm in the States.

It is stated that the Curtiss Eastern Airplane Company of the United States of America, although in existence but a few months, has sold over 75 Curtiss aeroplanes, the majority being Army training machines.

No sooner does a batch of 15 or 20 machines arrive at this company's aerodrome at Pine Valley, than the whole number is sold. It is stated to be impossible even to get a "joy-ride." Other companies appear to find things much the same, so that the future of aviation in the United States seems assured.

MARTINSYDE ACTIVITY.

Martinsyde, Ltd., are embarking upon a fairly extensive programme, ranging all the way from passenger-carrying aeroplanes to bicycles and farm wagons. One hears that drawings for the two latter future products of the firm are being made out, and that special machinery for their manufacture is being installed in various parts of the works.

Among the types of aeroplanes which Martinsyde, Ltd., are constructing and contemplating constructing are some interesting machines. One of these is the machine which they will enter for the Australia flight. This is a dual control two-seater biplane.

The pilot sits in rear of the observer or passenger. The general appearance of this machine is similar to that of the Martinsyde Transatlantic machine. It is fitted with a Rolls-Royce "Falcon" engine of 285 h.p.

Another machine being erected is a three-seater dual controlled biplane, which a film company intend to use for taking pictures from the air. Again, the pilot's cockpit is behind that of the passengers, in which there is room for two persons sitting side by side. The lines of this machine are similar to those of the Australian flight biplane.

A land undercarriage or floats may be fitted. The engine is presumably either a "Falcon" Rolls-Royce or a 300-h.p. Hispano-Suiza.

A three- or four-seater "limousine" biplane is also under construction, intended to carry either passengers and luggage or freight. The pilot sits above the petrol tank, immediately behind the engine. Behind him there are situated a small space for luggage, and then two seats for passengers behind each other, each seat accommodating two persons. The seats may be removed if desired and the space utilised for freight.

Rumour has it that a single-seater biplane will shortly be produced by this firm, somewhat similar to their F.4 machine, but with a greatly increased performance.

It is probable that Martinsyde, Ltd., will devote no small portion of their energies to participation in competition flying.—J. F. S.

A CHANGE OF ADDRESS.

The Palmer Tyre, Ltd., wish it to be known that their Leeds depot has been moved to large premises at York Road, North Street Corner, Leeds. Owing to labour troubles the new depot is still in an unfinished state, but Mr. Pepper, the manager, will give prompt attention to all requirements of the Aircraft Industry and the Motor Trade.

NEW COMPANIES.

Ogilvie and Partners, Ltd.—Private company. Registered Oct. 2nd. Capital, £10,000 in £1 shares. To take over the business of a consulting aeronautical engineer carried on by A. Ogilvie, C.B.E., F.R.A.E.S., at Gwydir Chambers, 104, High Holborn, London, as "Ogilvie and Partners." The subscribers (each with one share) are: A. Ogilvie, 3, Hans Crescent, S.W.1, consulting aeronautical engineer; F. P. Walsh, 23, Cheyne Court, S.W.3, civil engineer. A. Ogilvie is permanent governing director and chairman. Registered office: Gwydir Chambers, 104, High Holborn, W.C.1.

MISAPPREHENSION.

While in the vicinity of Brooklands the other day one heard a small boy remark, as a Vickers "Vimy" machine began to glide towards the aerodrome: "I say, that aeroplane's shut off its steam!" Which reminds one of certain people who, when they saw the exhaust trailing behind an aeroplane, said: "That must be a fighting aeroplane; look at the smoke from the machine-gun." Doubtless people are now better educated in aeronautical affairs, having actually flown, an experience which seems to make most people curious as regards the function of the external and visible components of an aeroplane.—J. F. S.

Steel & Service

The name of Edgar Allen's has always been associated with steel of the finest quality, and it is also linked up with the idea of service. The undermentioned list of handbooks and catalogues indicates one way in which this idea is carried into execution. Write for

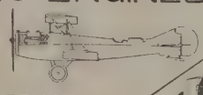
Edgar Allen's

CATALOGUE "G."
There is a right steel for every tool. This book will help you to choose the right steel.

CATALOGUE "D."
Describes Edgar Allen's Motor Car and Aircraft Steels, of which many are of great service in general engineering work.

CATALOGUE "B."
Describes the peculiar properties of Edgar Allen's "Imperial" Manganese Steel, and shows by illustrations where its use effects savings in mining and engineering work.

"FACTS ABOUT FILES"
Tells you how to get the most work out of Edgar Allen's Files and how it pays to take care of them.



Write for that which interests you.

PLAIN IMPRESSIONS

By A. S. G. BUTLER.

With an Introduction by C. G. GREY, who says:

"The writer of this book is an architect by profession and was an artillery officer through the incidence of war. . . . Those who have had the privilege of serving the King in the field will recognise the deadly accuracy of the brief sketches which form this little book, and those who have not had that honour may gather from them an idea of active service somewhat different from that conveyed by the more highly coloured pictures of professional artists in words."

THE AEROPLANE & GENERAL PUBLISHING CO., LTD.,

Sec. Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank :—T. A. Russell, Sept. 6th; G Spurgen (contracted on active service), Sept. 10th.

The surname of Capt. G. L. Godden is as now described, and not "Gooden," as stated in "Gazette" of Aug. 19th.

MEDICAL BRANCH.—Capt. T. E. Mulvany relinquishes his commn. on account of ill-health contracted on active service, and is permitted to retain his rank, Aug. 13th (substituted for notification in "Gazette" of Sept. 2nd).

CHAPLAINS BRANCH.—The Rev. A. J. N. Saunders is transferred to unempld. list, May 27th.

MEMORANDA.—Sec. Lt. (Hon. Capt.) F. C. Marsh is granted the hon. rank of Maj., July 4th.

The following Overseas Cadets are granted temp. commns. as Sec. Lts., with effect from Feb. 15th, and relinquish such commns., with permission to retain the rank, from the day following termination of standardised voyage in the case of those claiming immediate repatriation, and from the day following demobilisation in England in all other cases :—316105 C. D. Hooper, 184852 H. S. Morris (since killed).

Pilot Offr. (Hon. Flg. Offr.) W. E. Cowie is transferred to unempld. list, from (S.O.), Sept. 3rd.

The surname of G. H. Piercy is as now described, and not "Piercey," as stated in "Gazette" of June 24th.

PERSONAL NOTICES.

MILITARY.

ENGAGEMENTS.

ATTWATER — WHEATLEY.—The engagement is announced between Lieut. Harry Fletcher Attwater, Northumberland Fusiliers (att. R.A.F.), eldest son of the late Rev. H. S. Attwater and Mrs. Attwater, of Lytham, and Winsome Wingate Wheatley, elder daughter of Lieut. Colonel J. P. D. Wheatley, R.A.F., and Mrs. Wheatley, Carlisle.

BROOKE—IRWIN.—A marriage has been arranged between Captain Arthur Brooke, 10th Hussars, attd. R.A.F., younger son of the late Sir Douglas Brooke, Bart., and Lady Brooke, of Colebrooke, Brookeborough, County Fermanagh, and Lilian Maud (Lola), daughter of the late Mr. Charles B. Irwin, of Drumglass House, Dungannon, and Mrs. Orpen-Palmer, The Barracks, Birr.

SETH-SMITH—MCKERGOW.—The engagement is announced between Kenneth Arthur Seth-Smith, 5th Fusiliers, attached R.A.F., youngest son of Mr. and Mrs. Martin Seth-Smith, Colwood, Bolney, Sussex, and Doris Roberta, only daughter of Lieut.-Col. R. W. McKergow, O.B.E., M.F.H., and Mrs. McKergow, Twineham Grange, Sussex.

BIRTH.

DISNEY.—On Sept. 22nd, at Heronsgate, Rickmansworth, Herts, to Lieut.-Col. H. A. P Disney (late T.F. and R.A.F.) and Mrs. Disney—a son.

AIR FORCE.

MARRIAGE.

GIBSON—BORWICK.—On Sept. 10th, at Toronto, Canada, Lieut. Campbell Blakeley Gibson, late R.A.F., eldest son of Mr. Campbell B. Gibson, of Welland, Ontario, was married to Beatrice, youngest daughter of Mr. Charles Borwick, of 168, Blythwood Road, Toronto, Canada.

BIRTHS.

DURSTON.—On Sept. 29th, at "The Rays," Ryde, I.o.W., to Vera, wife of Capt. A. Durston, A.F.C., R.A.F.—a daughter.

McMINNIES.—On Oct. 2nd, at 18, Gloucester Road, Birkdale, Southport, the wife of Major W. G. McMinnies (late R.A.F.), of a son.

TAIT.—On Sept. 30th, at a nursing home, Southsea, to Sybil (née Sparkes), wife of Capt. W. M. Tait, A.F.C., R.A.F.—a son.

BALLOONS FOR CONSUMPTIVES.

The following, by the medical correspondent of "The Times," appeared on June 16th :—A short time ago it was suggested in "The Times" that the good effects of a high-altitude sanatorium might be obtained by means of captive balloons. The point was made by Surgeon Anderson in a recent work on the medical aspects of flying. In its last issue the "British Medical Journal" deals with the matter under the heading of "Aerial Spas," and makes reference to another article on the subject, by Captain Brown, R.A.M.C., appearing in the "National Review."

The idea, as we pointed out before, has a good deal of scientific backing. An atmosphere entirely free from germs is one of the medical attractions of the Swiss mountain resorts. This can be obtained at 5,000 ft. above any English town. Tubercular patients might thus be able to have sanatorium treatment of a new kind after the same manner.

That the subject is being considered in a serious spirit is proved by the fact that the "British Medical Journal" received an article recently from an officer of the Royal Army Medical Corps, in which he worked out in some detail the requirements for fitting out a captive airship as a tuberculosis sanatorium. There are, however, various questions of atmospheric pressure and density which have an important bearing on the subject. These questions are not yet fully understood, though careful researches have been carried out on mountain sickness and allied states by Barcroft and others. The field opened up is interesting, and may be valuable.

G. R.

MINISTRY OF MUNITIONS.

By Direction of the Disposal Board.

Upper Heyford Aerodrome

OXFORDSHIRE.

Area - - - About 260½ acres.

For disposal as a whole, or the buildings and land on which they stand, without the Aerodrome itself. The buildings are of brick, terra cotta blocks or breeze blocks, with asbestos sheeting roofs.

There is a water supply and electric light plant. Drainage. Permanent tarmac roads.

In addition to its use as an

AERODROME

the buildings are suitable for

FACTORY, STORAGE,
SANATORIUM, TRAINING INSTITUTE,

and many other similar purposes.

The Site is occupied by the Government under the Defence of the Realm Regulations and can (if necessary) be purchased under and subject to the provisions of the Defence of the Realm (Acquisition of Land) Act, 1916.

For further particulars apply to the **Disposal Board (D.B.1. a/3), Room 135, Charing Cross Buildings, Villiers Street, London, W.C.2.**

NOTE :—"SURPLUS," price 3d., the official list of Government property for sale. Published twice monthly. On sale everywhere.

OCTOBER 15, 1919.

THE AEROPLANE

VOL. XVI. No. 16.

The Editorial and Advertising Offices of "The Aeroplane" are at 175, Piccadilly, London, W.1.
Telegraphic Address: "Aileron, London." Telephone: Gerrard, 5407.
Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Street, London, W.C.2.
Subscription Rates, post free: Home, 3 months, 7s 6d.; 6 months, 15s.; 12 months 30s. Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8. U.S.A., 1 Year, $8 50c.

ON THE COMING OF AERIAL TRANSPORT.

A PROPHETIC EFFORT AND A MINOR REVELATION.

All who are in any way believers in the future of aviation can foresee the period when those who wish to travel with speed and in comfort will fly in preference to travelling by land or water. Also, as one has pointed out in these notes from time to time, it is fairly evident that regular transport and travel by air will come as a natural process of evolution from that species of flying which is commonly called "joy-riding": just as motor transport developed from the fearsome joys of the "get out and get under" days of early automobiles, and as the bicycle has become merely a geared-up auxiliary to the human boot after being a mechanical aid to sport developed from the neck-breaking fascinations of that extraordinary vehicle paradoxically known as the "ordinary" bicycle.

But the difficulty has been to discover the precise state of affairs which will give to flying that impulse which will, so to speak, cause the precipitation of joy-riding and crystallise it into firmly established aerial transport. One believes that at last one has discovered this impelling cause which has hitherto been so obscure.

So far, all our visions of future aerial transport has been based on pure faith. And it will be remembered that an inspired schoolboy once defined faith as "believing what you know isn't true." The eye of faith has seen the future of flying for centuries, but it has been the intermediate steps which have never seemed true.

The first true step was seen when Orville Wright held a flying-machine off the ground for a few yards in December, 1903. Since then we have advanced somewhat, but the top step has always remained invisible. Now at last it seems to be in sight, though we shall take some time to reach it. Therefore one proposes to venture on a little prophecy by way of showing the process by which we may arrive at our goal.

Prophecy and Practice.

But, first of all, one would like to express one's indebtedness to Mr. Cramp, Mr. Thomas, and the National Union of Railwaymen for this minor revelation which has enabled one to see clearly the Coming of Aerial Transport. But for their strike one might still be groping in the dark and seeing only with the eye of faith. To-day one sees more clearly in the light of the great Laws of Cause and Effect, and of Supply and Demand. Let us then consider the matter.

Primarily, when a man (as usual, embracing woman) travels from place to place he wishes to do so as quickly and as comfortably as possible. The railway train succeeded because it was quicker and smoother than the stage coach. The motor-car is superseding the railway train because for journeys up to 150 miles or so it is quicker and less tiring to get into a car at one's own door and alight at one's destination than it is to go to a railway station, wait for a train (or, alternatively, worry about catching a train and hustle into it at the last moment), sit in a stuffy carriage with unpleasant people, and finally scramble for a porter and a cab to take one to the end of the journey.

All who can afford to keep a car, and many who cannot but do, travel by road in these days in preference to travelling by train. Even those who neither can nor do keep a car travel by road when possible. Hence the rapidly growing popularity of that horrific mechanism the motor *char-à-bancs*.

Furthermore, the increasing reliability of internal-combustion engines, the success of mechanical transport during the war, and the tens of thousands of men and women who have been educated by the war in the driving, maintaining, repairing and organising of motor vehicles, are all combining to bring more and more motor vehicles onto the roads. The result is that already the roads are becoming uncomfortably crowded. And the increase has been particularly noticeable in the past two months.

The Revelation.

Some two or three months ago an R.A.F. officer lately returned to the motor trade remarked that during the previous week-end he had been out testing a new fast foreign car, and that never once was he able to find a clear stretch of road where he could let her out and try her best speed. Since then one has done a good deal of driving on a British car which is very far from fast, and even on that it has been difficult to find opportunities for "letting out" at any time of the day or week.

Even on the Coventry-London road one was constantly held up by traffic jambs. Coming up from Southampton one afternoon it was not possible even once to rush a hill, because on every hill there were always two, and sometimes three or four, motor vehicles proceeding in opposite directions and blocking the road.

Then came the strike. Every available motor vehicle was put on the road. The pace of the traffic in London itself became slower than the pace of a four-wheeled horse-cab.

One day, going down the Bath road in a hurry, one found that the traffic was thicker fifteen miles out from London than it was in Oxford Street before the war. At last one found what looked like a clear run of a few hundred yards and opened the throttle. Before the speed had risen much above the legal limit another batch of vehicles came round a corner, on went the brakes, and one cursed the traffic and the roads and the drivers, and especially the railways which ought to have been carrying all this stuff but were not. Then the quiet little woman sitting beside one said gently: "It's no good. We shall have to fly."

The Logical Development.

And when you come to think of it, that is the only logical development from the state of affairs which is going to arise in the very near future, though at first sight it seems like a revelation.

Every motor factory in this country is going full speed

ahead with vehicles of all kinds, from lorries to cycle-cars. There are tens of thousands of vehicles on order in America and France. And, despite the pious resolutions of those papers which vowed never to accept enemy advertisements, there will be thousands of German cars brought into Great Britain in the next year or so.

The result will be that if only half the motor vehicles which are on order to-day are put on the roads during the next twelve months the traffic on our main roads in the country will be as thick as our street traffic was before the war. And the average speed of that traffic will be as low as was the speed of pre-war street traffic.

Already the motor manufacturers seem to realise that the day of the fast touring car is gone, for wherever one goes in motor-car or body works one finds an increasing number of limousine or landaulet or coupé bodies being built. In fact, at one big shop—formerly devoted to aeroplane production—all the work was being done on closed cars; and at another, out of 18 bodies in course of construction, 16 were coupés. Which means that the motor trade is selling town carriages and not fast long-distance cars.

The Help of the Railways.

Over and above this it is well to remember that already the railways are practically State-controlled—which means that they are not controlled at all, and are rapidly deteriorating from being the most efficient railway system in the world, under the spur of mutual competition, into the usual slackness of a Government job run by amateur politicians. Ere long our railways will doubtless be State-owned, and so will sink to the level of our telephone system.

This will naturally be a very great help to aerial transport, for when it takes 6 or 7 hours to get to Manchester or Liverpool by rail by "State express service" consisting of 2 or 3 trains a day—instead of 4½ hours with 6 or 7 trains a day under business management—people who are bent on business will obviously prefer to fly the distance in an hour and a half. And if the Aircraft Industry is half awake to its opportunities it will start at once to prepare for regular passenger services.

A Misplaced Hope.

The objection has been raised by certain "doubting Thomases" that the Ministry of Transport under the versatile Sir Eric Geddes intends so to improve our roads that our road traffic will be able to circulate rapidly and safely. This hope of improvement displays a lack of knowledge of that elemental fact—with which Mr. Fairey made such useful play at Bournemouth—that the whole fabric of British Society is based on the Land Laws, and that it takes a separate Act of Parliament to remove any land boundary.

Even if power were given to the Ministry of Transport by a single Act to commandeer any land required for road improvements it would take fifty years to widen and straighten our main roads—leaving by-roads out of the question. And strikes by the Amalgamated Society of Road Makers would probably add another ten years to that. So the progress of this new Eric will be, like that of his more famous name-sake, little by little, in spite of all his bull-at-a-gate methods.

Also, the output of motor vehicles will certainly increase very much faster than the roads can be improved to carry them. This much can be seen in the United States to-day, where every road within twenty miles of a big city carries a constant procession of motor vehicles. And in America, be it remembered, the authorities have a much simpler job, for they have only to make new roads through open country, whereas in this country roads, villages, and towns will have to be altered all at once if the traffic is to move as it should.

Moreover, the present absurd speed-limit will have to be removed. And that means another Act of Parliament.

America's Beginning.

Those who take the trouble to read carefully the notes on Commercial Aeronautics in this paper will have grasped already the fact that aeroplanes are being sold in the United States to private individuals at a far greater rate than they are being sold here. And this in spite of the fact that a lot of the stuff which the good Americans are buying is of a kind that no self-respecting British aviator would fly.

Some of these machines are being bought simply for advertisement, but one hears that the majority are bought by people who really want to use them for personal transport, either because the existing roads in the States are so crowded that there is no fun in motoring, or because there are no roads at all. Which is merely another example of extremes meeting.

The Aerodrome Trouble.

Another objection which has been raised is that, even if the Aircraft Industry does pluck up courage and establish regular air lines, it is going to take at least as long to get from the centre of any city to the aerodrome as it does to get from the centre to the railway station, if not longer. That is true at the moment, but it seems possible that the aerial transport firms themselves may organise motor services to the aerodromes which will overcome this trouble. And in the case of London, long before the war it was accepted as a fact that the Golder's Green Tube was to be extended to the London Aerodrome at Hendon.

Other cities which are not blessed with Tubes will perhaps in time develop municipal aerodromes with a municipal tram or 'bus or car service to and fro. And the smaller towns and bigger villages will be able to establish aerodromes quite close to their borders.

The Simple Solution.

There is, however, a still simpler solution of the difficulty. That is not to bother about aerodromes at all—except as garages—and to equip all the important aerial transport lines with amphibious machines which can start from and alight on land or water equally easily.

There is no difficulty about building such machines for civilian work. The first Sopwith "Bat-Boat" was an amphibian, and won the prize offered by Mr. Mortimer Singer for an all-British machine of this kind. The offer of the prize is evidence of Mr. Singer's foresight, and the fact that nothing has been done since 1912 to develop the type until the conditions were issued recently for the Government's 1920 Competition is no credit to the British Aircraft Industry nor the Technical Department at the Air Ministry, nor to the Royal Aero Club, which is supposed to interest itself in the Sport of Aviation—a sport for which the amphibian is particularly suited.

Every great city has a ready-made aerodrome on the river which has made it a great city. And in the case of the few cities which have grown large owing to some special industrial cause—such as Birmingham and Manchester—it might well be easier to form a big lake than to build a land aerodrome. One forgets the exact size of the Edgbaston Reservoir at Birmingham, but one seems to remember that it is big enough to be used by seaplanes, and it is very much more accessible than the Castle Bromwich aerodrome.

Of our greatest cities, London, Liverpool, Hull, Portsmouth, Southampton, Plymouth, Falmouth, Bristol, Edinburgh, Glasgow, Dublin, Belfast, Cork, Londonderry, Dundee, and Aberdeen are all so situated that amphibious aeroplanes can penetrate almost to their business centres, whereas in every case their nearest land aerodromes are miles outside the city boundaries.

The Matter of Cost.

The greatest hindrance at the moment is the question of cost. Few can afford the prices charged to-day for aerial transport. Who could pay £15 15s. for a single fare to Paris, or £25 to Swansea (apart from the fact that most people would pay as much to avoid going to Swansea)? Prices must come down. And they will come down as soon as those who are responsible awake to the fact that supply creates demand just as much as demand creates supply.

Petrol must come down to a shilling a gallon instead of its present abnormal price. If not, we must use benzol or adapt our engines for alcohol. Already one knows that aero engines have done good work on benzol.

Then the cost of engines must come down. Already one great firm has taken the first step towards supplying thoroughly reliable engines at a price which brings the complete three-seater 100-mile-an-hour aeroplane inside £1,000.

And aero-engine makers who charge that sum, or double that sum, for an engine alone will do well to remember that their present engines have not to bear the heavy charges of tests and experiments, for all those costs have already been paid by the Government during the war. Therefore all they have to reckon in their costs is material and labour, plus overhead factory and selling charges.

Perhaps few of them have considered that a £2,000 engine means a charge of £200 per annum on the aeroplane simply as interest on capital invested and allowing nothing for depreciation. Allowing the engine 1,000 hours' flying in the year, this means 4s. per hour capital charge alone. The point is worth considering. Engine prices must come down, and the sooner they come down the greater will be the sales and the greater the ultimate profits to the makers.

The demand already exists for aerial transport. The Avro Company's work in carrying 30,000 passengers (which means at least 300,000 passenger-miles) without killing one of them shows that travelling by Avro is safer than travelling on an American railway. Similarly, the Airco's seven weeks of regular service to Paris with only one failure to start, and without a serious accident to any passenger, shows that aerial transport is safe. The Handley Page service to Brussels, though more recent, has confirmed so far the safety and regularity of flying.

With lowered fares the demand will be far greater, for confidence in the safety of aerial transport is now instilled into the public mind. So that it is certain that, given easy access to passenger-carrying aeroplanes and fares which are within the reach of those who are less than millionaires, there can be a boom in Civil Aerial Transport at once. The doubtful factor is whether British manufacturers of aeroplanes and engines and organisers of aerial transport have the capital—and the pluck—to lower their prices so as to make more money.

A Clear View at Last.

Thus one sees at last a clear view of how we shall come to use aeroplanes as ordinary transport vehicles. Instead of travelling from London to Liverpool in an uncomfortably packed and slow train, or crawling in a car through a mephitic crowd of automobiles, we shall take a taxi to the Temple Steps, board an amphibian, get off the river as may best suit the wind, and alight in an hour and a half, or at most two hours, on the Mersey, within five minutes of Dale Street.

In the journey to Dublin or Paris we shall have still greater advantages, for we shall eliminate all the discomfort and worry of the steamboat journey, and shall

The Hamburg-Amerika liner "Bodensee" over Berlin. The airship, which is 395 ft. long, has accommodation for 50 passengers.

alight on the Liffey or on the Seine for the first time after leaving the Thames. And because our machine is amphibious we shall fly straight overland, knowing that in case of engine failure we can land safely on any open piece of ground.

Railway strikes, State deteriorated railways, crowded roads, bad surfaces—all the annoyances of terrestrial travel will not matter. For, as Colonel John Porte said a few days ago, when holding forth on this same subject, "There is plenty of room up top-sides."—C. G. G.

ON FALSE ECONOMIES.

In their time His Majesty's varied Flying Services and the powers that from time to time have ruled over them have done many things. They have done the right thing in the wrong way, and the wrong thing in the right way. They have committed indiscretions on so grand a scale as to have scored veritable triumphs, and they have done the obviously right thing in so hole-and-corner a style as to have nearly rent asunder the Empire.

They have conducted themselves in such manner that they have at one and the same time incurred the considered disapproval of the "Times" and THE AEROPLANE, the "Daily Herald" and the "Morning Post."

They have combined into one body those two incongruous elements, the R.N.A.S. and the R.F.C., in so wondrous a medley that the members of the composite body disapprove of themselves even more cordially than they ever detested that one of the original elements to which they did not belong.

With so vast a field of achievement to pick from, it is scarcely surprising that there should be some things of real value to be found within the R.A.F.

HOMES OF EXCELLENCE.

Amongst these without doubt should be classed the two testing stations at Grain and Martlesham.

Both these establishments had their origin prior to the All Fools' Day fusion. That they have not been reduced since to inutility and inefficiency may be ascribed to the fact that they are both of them located in rather inaccessible and not particularly fashionable neighbourhoods, and that both of them have had plenty of quite hard work to do. They have therefore attracted only such officers as were keenly interested in their work, and have escaped from that devastating influx of brass-bound promotion-hunters in search of a quiet life who have so seriously compromised the reputation of most of the technical branches of the Air Services.

Under the control of a series of extremely able and competent commanding officers, these two stations have quietly and unostentatiously carried on the development of reliable methods of testing the performances of all kinds of aircraft, and they have done this in a way which has gained for them the confidence of all aeroplane manufacturers who have had to deal with them, despite the R.A.F.-engendered distrust of all official tests against which they had to make headway.

THE INDUSTRY'S CONFIDENCE.

The designer of a new type of aircraft knows now that, if his machine is sent to either of these establishments for test it will be flown by capable and unbiased pilots, that every precaution will be taken to secure the most accurate possible measurements of its performance, and that its general suitability for its intended purpose will be reported upon by men who know their business and have no interest beyond a wish to help in the improvement of the aeroplane breed.

The services rendered to the British Air Forces and to the British Aircraft Industry by Grain and by Martlesham far exceed those of all the rest of the technical branches of the Service put together, with the N.P.L., the Advisory Committee on Aeronautics, and the Royal Aircraft Establishment thrown in.

It is therefore not surprising that the "Times"-impelled economy campaigners have settled upon these really useful stations as a fit field for their operations, and that it has been definitely decided to shut down Martlesham Heath for the whole of the next winter. A valiant effort is being made by the responsible and competent ones who remain in the Technical Department to save Grain from the same fate, but there is every likelihood that this effort will fail.

WHERE ECONOMY OPERATES.

It is gathered that by closing down Martlesham and leaving it under a guard of 50 men, some 200 rank and file of the Air Force will be released for the more essential duties of releasing W.R.A.F. cooks, clerks, and mess waitresses, and that roughly an equal saving can be made from Grain.

In order to secure this, it is proposed to deprive the R.A.F. and the British Aircraft Industry of the excellent testing organisations which have been built up at these two establishments.

True, it is proposed to close them only for the winter, but to anyone acquainted with the manners and customs of the Air Ministry it will be obvious that, having once dispersed the trained staffs now employed at these stations, it is in the highest degree improbable that they will ever be re-collected and put to their right work again, and with unexperienced officers and untrained men such an establishment will not be likely to return to decent working order until it is again time to shut down for the winter.

THE BENEFITS OF PUBLICITY.

The matter is of the very highest importance, both to the R.A.F. and to the Aircraft Industry in general. Neither Grain nor Martlesham Heath have ever possessed a publicity department, such as that unblushingly run by the members of the Royal Aircraft Establishment, and therefore the general public have never even heard of them, and they present an easy mark for our economy-mongers.

But if the Air Force and the Aircraft Industry of the country are to survive, it is absolutely essential that properly organised full-size aeroplane laboratories should be maintained. If it needs the whole 2,000 officers and the 25,000 men to which the R.A.F. is to be reduced to staff them, they should be kept going.

It is possible to improvise an Air Force in case of emergency if the material is available. The material can only be available if full-size research work is carried on continuously and uninterruptedly, and if the manufacturer is continuously encouraged to improve his product.

THE NEED FOR KNOWLEDGE.

All the camouflaged soldier amateur aviators in the country—excellent fighting pilots though some of them are—will be precious little use to the country in the next Great War if the Aeroplane Industry is dead.

It is therefore up to the still surviving aircraft manufacturers of this country to take this matter up. If this policy is persisted in, it will be no long time before privately designed aircraft are again handed over to the Royal Aircraft Establishment for test and report, with consequences not really difficult to foresee.

If, in spite of all protests, the Air Ministry persist in this—the most stupid of their errors—it would be well worth the S.B.A.C.'s while to attempt to buy up Martlesham Heath as a going concern, offer to its staff decent living wages, and run it for the benefit of the Industry.

It would not be very long before they could realise quite a handsome profit on the fees for testing Government aircraft.—W. H. S.

AN HISTOR C EVENT.

An event of the foremost importance in the history of aviation is recorded in the French section of Commercial Aeronautics this week. It is there stated the MM. Gastambide and Levavasseur have obtained successful experimental flights with a variable surface aeroplane of the latter's design. To the present generation of pilots these names mean nothing, so it may be well to explain that the father of M. Gastambide in partnership with M. Mengin financed and built a monoplane in 1908, which monoplane and its engine were designed by M. Levavasseur, who at that early date had produced an aero-engine (originally designed for racing motor-boats), which weighed only 5 lb. per horse-power.

This engine, which was of the "Vee" type, was called the Antoinette, after the daughter of M. Gastambide, and it embodied most of the outstanding features of the best modern aero-engine practice, besides others which may yet return to use. The original Gastambide-Mengin monoplane became in 1909 the famous Antoinette monoplane, and it remains to this day the most graceful flying-machine ever built. Also, it was, in spite of its early date, so efficient as to compare favourably with many highly reputable machines of to-day.

The Antoinette failed to survive because of errors in detail design and because of the peculiar system of control adopted, but aero-dynamically and æsthetically it was seven or eight years in front of its time. *Père* Levavasseur retired from aviation and nothing has been heard of him in the world of aeronautics since 1912. His return, in company with M. Gastambide Junior, may be taken as signifying that in the intervening years he has studied the progress of aeronautical science and feels himself competent to solve the problem of variable surface, which problem is one of the chiefest factors in the future of commercial aeronautics. It would be the highest poetic justice if it should prove that the great engineer and pioneer Levavasseur has solved that problem and has fulfilled the promise given in earlier days.—C. G. G.

THE R.A.F. RECORDS MYSTERY.

The following letter has been received with reference to the mysterious disappearance of the pre-war Records of the "First Four Squadrons":—

Sir,—May I have your permission to bring before your readers a matter of national importance? I am engaged in preparing, from official material, a history of the War in the Air. When our Army took the field in August, 1914, it was assisted by Numbers 2, 3, 4, and 5 Squadrons of the Royal Flying Corps. The value of the help given by these squadrons cannot easily be over-estimated; indeed, but for the information they supplied the Germans might possibly have succeeded in surrounding and destroying the whole of our Expeditionary Force.

The Royal Flying Corps were thoroughly trained for their work. From the date of the formation of the Corps, in May, 1912, down to the outbreak of war, they had been engaged in preparing themselves, by constant exercise and manœuvre, for just such a task as fell to them. Their numbers were small, but they were perhaps the most efficient and best-trained Air Force in Europe. The training was carried out at the centres—Farnborough, Netheravon, and Montrose—where the squadrons were stationed, and a record of the work done was entered by the commanding officers in the Squadron Record Books.

These record books have all disappeared. When the War broke out the commanding officers were ordered to forward their record books to the Royal Flying Corps Headquarters at South Farnborough, and this was done. Then year followed year; the Flying Corps, as everyone knows, developed at an enormous rate; the Royal Aircraft Factory at South Farnborough grew out of all recognition; and in the growth and change of the time the record books, packed in Renault or Gnome engine boxes, were shifted from place to place at South Farnborough.

When a man is fighting for his life he has not time to spend on the relics of his infancy. Nevertheless, the record books were preserved, and when the Royal Air Force was formed, late on in the war, they were dispatched from South Farnborough to the depot that was being formed at Blandford. There is evidence of their dispatch, but direct first-hand evidence of their receipt is lacking, and they have not been found at Blandford.

The Royal Air Force is now rapidly being demobilised, but among past or present members of the force someone who reads this letter may remember seeing the record books and may have something to tell. Any clue to their whereabouts would be more than welcome at the Historical Branch of the Royal Air Force, 2, Cavendish Square, London, W.1. Their importance is great. They were written by men whose names are now widely known, and whose early work did much to win for us our dominant position in the air.

(Signed) WALTER RALEIGH.

[It is hoped that everybody who can throw any light on the mystery will communicate with Sir Walter.—Ed.]

AN UNKIND FATE.

The railway strike has been unkind to others than those who were merely discommoded by the difficulties of transport. It will be remembered that last week the Committee of the Royal Aero Club postponed the Schneider Cup Consolation Race—officially known as the "Royal Aero Club Seaplane Competition"—on account of the railway strike, apparently assuming—as did most people—that the strike was going to last until the end of the month, and so would save the Committee all the trouble of having to organise a competition. One can picture to oneself the Committee sitting back and folding its hands and saying "Thank Heaven! That saves us a lot of trouble, because nobody will expect us to hold a competition in November or December."

Fate, however, seems resolved to be unkind to the Committee, for no sooner was the postponement announced than a wire arrived from Italy entering a Savoia seaplane for the new race. One is not aware whether it is the identical Savoia which did so well in the Bournemouth fiasco, but, seeing that the same company has entered for the Royal Aero Club Seaplane Competition, the Committee is now in the unpleasant position of leaving foreigners to assume that the British seaplanes are afraid to meet the Italian again under more favourable conditions.

If Fate had been more kind the Committee could safely have resumed once more its habitual attitude of a dormouse; but the Italian entry must at least disturb its dreams.

CONGENIAL WORK.

The Committee of the Royal Aero Club states that "there has been a widespread expression of opinion that the first direct Transatlantic Flight by Sir John Alcock and Sir Arthur Brown on a Vickers' Vimy Rolls biplane on June 14th-15th, 1919, should be permanently recorded in the Club House," and has opened a subscription list with the object of paying for "portraits in oils" which Sir John Lavery has consented to paint "at a purely nominal figure."

One would like to point out to the Committee—which appears to include several educated men—that the first direct trans-Atlantic flight was made by Captain John Alcock, D.S.C., and Lieutenant Arthur Brown, and that these officers did not become Knights till some time after their feat. Also one would like to indicate that the flight in question was the first direct flight in history, and not merely the first on "June 14th-15th," nor the first on a "Vickers' Vimy Rolls Biplane." Furthermore, the Committee might note that "trans" is merely an adverb and not the name of a place.

However, doubtless, as in the case of the Schneider Cup fiasco, the Committee meant well, and one wishes the subscription success. Doubtless ordering "portraits in oils" is more congenial work than labouring to promote the sport of aviation.—C. G. G.

THE TANK INQUIRY.

Lieut.-Comdr. Harold Perrin, late R.N.V.R., Secretary of the Royal Aero Club, and Lieut.-Comdr. Barry, late R.N.V.R., desire it to be known that they have never put in a claim for reward in regard to the invention of the Tanks. They were called as Crown witnesses, and that is their only connection with the affair.

WANTED—A SECRETARY.

The Council of the Royal Aeronautical Society invite applications from members of the Society for the post of Secretary, which will shortly become vacant.

Applications should reach the Secretary at 7 Albemarle Street, W.1., before October 31st, 1919.

Applicants should state their War Service, Membership Grade, Secretarial and Technical Qualifications, and the rate of pay required.

ROYAL AERO CLUB NOTICES.

COUPE HENRY DEUTSCH DE LA MEURTHE.—Organised by the Aero Club de France under the Regulations of the Fédération Aéronautique Internationale and the Commission Sportive Aéronautique of France.

The Cup is an objet d'art of the value of 10,000 francs, with prizes of 20,000 francs each, to be awarded to the first three holders of the Cup.

1st Holder: Emmanuel Helen, May 1st, 1912. Distance: 200 kilos. Time: 1 hr. 30 min.

2nd Holder: Eugene Gilbert, October 27th, 1913. Distance: 200 kilos. Time: 1 hr. 13 min. 25 sec.

The third prize of 20,000 francs is now open for competition.

It is a speed contest in a closed circuit of about 200 kilometres, embracing Terrasse de St. Germain, Senlis, Meaux, Melun, Terrasse de St. Germain.

On September 2nd last, Sadi Lecointe completed the course in 48 min. 8 sec., giving an average speed of 249 kilos. 307 m. per hour.

If this speed is not beaten by one tenth within one year Sadi Lecointe will be the winner of the third prize of 20,000 francs and the final holder of the Trophy.

Particulars of the Competition can be obtained from the Royal Aero Club.

FEDERATION AERONAUTIQUE INTERNATIONALE CONFERENCE.—The Conference of the Fédération Aéronautique Internationale will be held at Brussels on the 22nd, 23rd, and 24th October, 1919.

The following delegates will represent the Royal Aero Club:—Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie, Lieut.-Col. Mervyn O'Gorman, C.B., Mr. Harold E. Perrin (Secretary).

NAVAL & MILITARY AERONAUTICS

[The "Official Gazette" notices will be found on p. 1412].

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

Buckingham Palace, Oct. 11th.

Major-General Sir Frederick Sykes (Controller-General of Civil Aviation) had the honour of being received by His Majesty, when the King invested him with the Insignia of a Knight Grand Cross of the Most Excellent Order of the British Empire (Military Division).

Lieut.-Colonel Robin Grey, Royal Air Force, also had the honour of being received by His Majesty, when the King invested him with the Insignia of a Companion of the Distinguished Service Order.

NAVAL.

Admiralty Appointments.

The following appointments have been made:—

Oct. 7th.—Paymr. Comdr.—W. D. Sarratt, to "Vindictive" (temp.), Oct. 6th.

Oct. 8th.—Lieut. (Retd.).—S. D. A. Grey, D.S.O., to rank of Lieut.-Comdr. (retd.), seny. Oct. 1st.

Admiralty Communique.

The following is extracted from a communiqué from the Senior Naval Officer in the Baltic, Rear-Admiral Sir Walter Cowan, R.N., issued on Oct 10th, dealing with the attack upon Kronstadt Harbour by C.M.Bs. and aircraft which took place on the night of Aug. 17th-18th. This attack was undertaken as a cover to our mine-sweeping operations, which were being undertaken with the ultimate object of sending foodships to Kronstadt and Petrograd:—

"The position of the ships in the harbour had been ascertained by aerial photographs, and the attacks on them rehearsed in detail by the boats against our ships. Aircraft were to co-operate, and it was planned that they should arrive and bomb the harbour just before the C.M.Bs.' engines could be heard. This time-table was most accurately carried out."

The following narrative of the part played by the aircraft has been compiled from reports received by the Admiralty from officers concerned:—

"Eight aircraft took part in the operation. The intention was that the aircraft should attract all attention in Kronstadt, so that the C.M.Bs. should be neither heard nor seen to approach the harbour; and with that end in view the bombing attack was timed to commence five minutes before the C.M.Bs. reached the line of forts to the northward of Kronstadt, and further, to continue until the boats reached the harbour entrance.

"The machines were detailed (a) to attack the flotilla leader anchored in the entrance to the harbour; (b) to attack guns' crews on the breakwater and searchlights; (c) to stand by to attack the line of forts and cover the retreat of the C.M.Bs. All the machines had orders to draw anti-aircraft fire.

"It is concluded that the presence of aircraft in this operation diverted the enemy's attention from surface craft, as until the boats reached the entrance to the Middle Harbour, all firing was anti-aircraft, and no searchlights were trained on the water. Even afterwards searchlights were trained on the sky and several batteries continued high-angle firing."

MILITARY.

A Tribute to Major-General E. B. Ashmore, C.B., C.M.G., M.V.O.

In the "London Gazette" of Sept. 26th it is announced that Major-General Ashmore is placed on the half-pay list of the Royal Artillery. He has, however, not yet relinquished his appointment as G.O.C. L.A D.A. The following graceful tribute to L.A.D.A. and General Ashmore is taken from the "Daily Express" of October 8th:—

"L.A D.A.

"So Colonel E. B. Ashmore—such being the substantive rank of Major-General Ashmore, lately commanding the London Air Defences—has been placed on half-pay. Thus passes, presumably in its war-time form, at all events, the exceedingly efficient organisation known shortly as Lada, which made it so hot for the Hun that he never tried to raid London after his disasters on Whit Sunday, 1918, though he made afterwards nineteen raids on Paris.

"The Mind of the Barrage.

"General Ashmore came over from France to take charge of our A.A. defences in the late summer of 1917, and to his combination of qualities as airman, gunner, and general officer belongs the chief credit for a very remarkable success. It was after his coming that the gun barrage became a scientific instrument of defence, and the night-flying squadrons owed much to his sympathetic enthusiasm. London owes him a debt that should not be forgotten now that the maroons are silent.

"Most who knew him and all who did not called him 'Splash' Ashmore. At an inspection he was the fiercest general who ever walked between the ranks of a gun detachment, and he had an intolerance of fools and junior officers which may sometimes have failed to tolerate wisdom. In mess he had the most charming smile and a suave courtesy which was no concealment for a very active and brilliant mind. He won many honours overseas and at home, and deserved them all. The A.A. gunners whom he commanded at home have no honours, not even one medal ribbon. Do they deserve one? General Ashmore could tell us."

Lieut.-Col. Robin Grey, D.S.O.

It may be called to mind by those who have been connected with aviation since pre- and early war days that Lieut.-Col. Robin Grey, Grenadier Guards and R.A.F., whose name appears in the Court Circular of Oct. 11th, was taken prisoner by the Germans in 1914. Capt. Grey—as he was then—was one of the first British prisoners of war to be sent to Karlsruhe for what was called by the British Press "retaliatory treatment." It was alleged that this was to be a deterrent to the Allied air raids upon the "open" Rhine cities, but, in fact, Karlsruhe was merely a clearing-house for prisoners whose camps were being changed.

AIR FORCE.

The King's Certificate.

The Air Ministry announced on Oct. 7th that His Majesty the King has been pleased to approve of the issue of a Certificate to Officers who have relinquished their commissions during the War under the following circumstances.

A.—Having served in a sea-going Ship of War at Sea, or abroad in a theatre of operations, since August 4th, 1914, and who have been invalided on account of ill-health or wounds, not due to misconduct, and where such is or are certified under the authority of the Air Council to be caused or aggravated by service

B.—Having been invalided on account of ill-health or wounds certified under the authority of the Air Council to have been caused or aggravated by service while engaged on flying duty at Home in connection with operations against the enemy, or aerial coastal patrol work, since August 4th, 1914.

C.—Having been invalided on account of disablement certified under the authority of the Air Council to be directly attributable to the action of the enemy, e.g., Air Raids or Naval Raids.

The certificates for officers of the R.F.C. who relinquished their commissions prior to April 1st, 1918, will be issued under the regulations laid down in Army Order 138 of 1918. The certificates for Officers of the R.N.A.S. who relinquished their commissions prior to April 1st, 1918, will be issued by the Admiralty.

His Majesty the King has further approved of the award of a special distinctive certificate to be entitled the King's Second Certificate, to officers who, after having become eligible for the award of the King's Certificate voluntarily served again, and again relinquished their commissions during the War, under the circumstances detailed in Paragraph 1 of this Order.

Applications from Officers who have already left the Service, and who are entitled to these Certificates should be addressed to:—

The Secretary, Air Ministry (P.4.E.), Kingsway, London, W.C.2.

Applicants must state:—(a) Full name and rank. (b) The grounds upon which the Certificate is claimed. (c) Details of service for which it is claimed, including the Branch or Arm of H.M. Service in which the applicant was serving at the time. (d) Date of relinquishment of Commission. (e) Whether a Certificate has already been applied for or been granted, in respect of service in the ranks, etc.

ROLLS-ROYCE

THE ENGINES WHICH MADE THE FIRST DIRECT FLIGHT ACROSS THE ATLANTIC.

The future of flying depends on trustworthiness.

Extracts from the "Daily Mail" (leading article), September 2, 1919 :—

THE PARIS AIR EXPRESS.

A GREAT ACHIEVEMENT.

It has fallen to a British firm, using British machines navigated by British pilots, to accomplish the most remarkable performance that so far stands to the credit of civil flying. Since Monday week the Aircraft Company's London-Paris Air Express has run either way, whatever the weather, to schedule time, covering the journey day after day in 2¼ hours. Though the weather was particularly unfavourable last week, on only 1 out of 15 journeys had the passengers and goods to be diverted to the alternative route.

The first requisite of a commercial air service is reliability, and as last week an efficiency of 94 per cent. was attained the business world has convincing evidence that the new service is of real use.

Commercial flying is as important to us now as military flying was then. Its possibilities are great, and in it we must be first.

We are exhibiting at Olympia, November 7-15, 1919. Stand No. 74

ROLLS-ROYCE ENGINES
ARE USED FOR THE PARIS AIR EXPRESS

Rolls Royce Ltd. 15 Conduit St., W.

The R.A.F. Cadet College

The following was issued on Oct. 8th :—

The Air Ministry has just issued a small booklet containing the regulations for the Royal Air Force Cadet College. It is obtainable from H.M. Stationery Office or their agents and from any bookstall at 3d.

The R.A.F. Cadet College has been instituted for the purpose of affording special education to candidates for Commissions in the R.A.F., and is intended exclusively for those who desire to make the R.A.F. their permanent profession in life.

The limits of age for admission to the College will be from 17½ to 19 years, with the exception of those who have served or are serving in the Forces, and are recommended by their C.O. for a permanent commission in the R.A.F., in which case the upper age limit will be 21. All applications for the printed form of application for admission to the examination should be made to the Secretary, Civil Service Commission, Burlington Gardens, London, W.1.

The booklet sets forth in detail the subjects for examination and possible marks. The subjects for the entrance examination which are obligatory are English, English History and Geography, elementary Mathematics, and one modern language. The optional subjects are Latin, Greek, another modern language, Mathematics (elementary, intermediate and higher), Science and elementary Engineering. All the obligatory subjects must be taken, but not more than three of the optional class may be taken, and candidates will be expected to qualify (to obtain not less than 33 per cent. of the total marks allotted) in each of the four obligatory subjects. Candidates will receive extra marks if they hold Certificate A from the O.T.C., or if they have served in the senior division of the O.T.C., or if they have completed four months' continuous service as Officers, Warrant Officers, or Non-Commissioned Officers and men in the Services. A certificate to this effect must be furnished on a form supplied to applicants by the Civil Service Commissioners.

A certain number of prize Cadetships will be awarded to successful competitors in order of merit at such examination, carrying certain emoluments and financial benefits. These are designed to give assistance to those who stand in need of the emoluments attached to them. Each candidate for Cadetship will be examined by a Medical Board.

There will also be a King's Cadet appointed by the Secretary of State for Air and Honorary King's Cadets nominated by the Secretary of State for Air, and a limited number of Cadetships will occasionally be filled by suitable candidates specially nominated by the Air Council, such recommendation being submitted by the candidate's headmaster.

The course of studies at the R.A.F. College during the first year will include :—

> English literature and language; the British Empire; practical mathematics, including mechanics and draughtsmanship; general elementary science; history of the R.A.F.; outline of Army and Navy organisation and characteristics of the various arms and types of ships; map reading; R.A.F. law and administration; drill (with rifles) and physical training; hygiene and sanitation; practical work in the workshops: the Morse code; passenger-flying with instruction in map reading, and use of compass and machine-gun.

During the second year the course will be :—

> Theoretical and practical instruction in engines, including magnetos and their management; theory of flight; practical rigging; advanced work in wood and metal workshops; wireless telegraphy and telephony; machine and Lewis gun; instruction in aviation.

The terms of payment are under consideration and will be issued shortly. They will correspond generally with those at the Royal Military Academy and Royal Military College, excepting that the R.A.F. Cadets will draw pay at 5s. a day during their first year's course, and 10s. a day during their second year's course. Other details concerning the syllabus of instruction at the College, government and organisation, discipline, etc., will be found in the booklet.

Extra Leave for Officers and Men of the Royal Air Force.

The Air Ministry announced on Oct. 7th that officers and other ranks of the Royal Air Force who were on leave in the United Kingdom on Sept. 27th will be considered to have their leave cancelled with effect from that date and will be entitled as from Oct. 8th (inclusive) to the remaining portion of their leave plus seven extra days.

These officers and airmen, who volunteered their services and were employed on duty in connection with the railway strike, but who were not on leave on Sept. 27th, will, on completion of this duty :—

(1) If on the home establishment, return to their units and then receive seven days' pay.

(2) If from France, Flanders, or the Rhine, report to the O.C., R.A.F., Manston, near Ramsgate, who will then grant them seven days' leave pending return to their units.

Vouchers will be given for these leave journeys.

Disbandment of the W.R.A.F.

The Air Ministry announced on Oct. 7th :—An Order has been issued for the final disbandment of the Women's Royal Air Force, which has already been reduced to small proportions through rapid demobilisation during the past few months.

The new Order that demobilisation of the large majority of officers and other ranks will be completed by November 8th. A small number will be temporarily retained for the purpose of closing records and winding up the affairs of the Force, and other special duties.

The Air Council has also issued the following special order :

"The Air Council desire to express their appreciation of the good work done by the Force both during and after the period of hostilities.

"In spite of much difficulty and in fact of hostile and unjust criticism, the W.R.A.F. has left a record of which they can feel well proud. During hostilities the good work they accomplished went far towards enabling the R.A.F. to reach the dominating position in the air which had such a direct influence in the achievement of the final victory.

"Subsequent to the Armistice, when it was necessary to disperse a large portion of the Airmen to civil life, it was the W.R.A.F. who made it possible for the R.A.F. to meet the demands made upon it and maintained the services at the aerodromes until new male personnel could be enrolled.

"The necessity for the demobilisation of the W.R.A.F. is now imperative, but in returning to civil life, Commandant Dame Helen Gwynne-Vaughan, D.B.E., Officers and Members may feel assured that they carry with them the good wishes of the Air Council and a debt of gratitude from the nation."

FRANCE.

General Hirschauer and the Senate.

General Hirschauer, formerly Director of Military Aeronautics, has announced his intention of contesting the senatorial election in the Lower Rhine.

The Paris-Cairo-Paris Flights.

The details of the flights from Paris to Cairo and back made by Commandant Vuillemin and Lieut. Dagnaux are as follows :—These officers made the flight on Bréguet biplanes (300-h.p. Renault engines). Commandant Vuillemin and his mechanic, Binet, succeeded in completing the course, but Lieut. Dagnaux had an accident on the return journey at Beyrout and had to finish the voyage by ship.

The distances and dates of the stages of Commandant Vuillemin's flight are as follows :—

Paris-Marseilles (Aug. 11th), 433 miles.
Marseilles-Naples (Aug. 12th), 435 miles in 6 hr. 30 min.
Naples-Salonica (Aug. 13th), 466 miles in 5 hr. 45 min.
Salonica-Constantinople (Aug. 14th), 310 miles in 4 hr.
Constantinople-Cairo (Aug. 16th), 807 miles (372 over the sea) in 8 hr. 30 min.
Cairo-Beyrout (Aug. 26th), 372 miles (310 over the desert) in 5 hr.
Beyrout-Constantinople (Aug. 28th), 621 miles in 8 hr.
Constantinople-Naples and Naples-Istries (Sept. 8th), 745 miles and 496 miles—1,241 miles in 15 hr.
Istries-Paris (Sept. 9th), 391 miles in 4 hr. 30 min.

Commandant Vuillemin is a distinguished officer in the French Army who has served for some years in the aerial arm of the service. He achieved many successes in aerial action against the Germans, as his seventeen citations in dispatches prove. For the last three years of the war he was graded as a *chef d'escadrille*. He is an Officer of the Legion of Honour and a Companion of the Distinguished Service Order and has the Croix de Guerre (with thirteen palms and five stars) and the Order of St. Anne, 3rd Class (Russia).

His energies have not faded since the incitements of war have vanished for a space.

GERMANY.

An Exodus of Aeroplanes.

About 170 of the military aeroplanes which ought to be delivered to Allied Powers under the terms of the Peace Treaty have been conveyed to Holland with almost ostentatious secrecy. Their identification marks were altered and it is possible that many may evade the vigilance of the Allies.

The Trial of German Aviators.

According to the Chicago "Tribune" on Oct. 7th the Supreme Council of the Allied and Associated Powers met

Official Thanks to Members.

The Home Office
Ministry of Food
Ministry of Transport
Postmaster General

and the

Chief Commissioner of Police

have expressed keen appreciation of the invaluable services rendered by Members of the Automobile Association during the Strike period.

The Executive Committee

cordially thank all Members, Agents and Repairers and Friends whose prompt and generous response to the Call enabled the Association to be of such value to the State.

W. JOYNSON-HICKS,
Chairman.

STENSON COOKE,
Secretary.

THE AUTOMOBILE ASSOCIATION AND MOTOR UNION,
Fanum House, London.

in Paris and discussed the advisability of trying the various German officers who are alleged to be guilty of any "violation of the recognised rules of warfare."

It is stated that the British list comprises, among others, certain aeroplane and airship crews who at various times were sufficiently unfortunate as to be ordered to raid London. Apparently, according to this message, it was no "violation of the recognised rules of warfare" to bomb Midland or coastal towns.

SWEDEN.

Lieut. Rödehn, of the Swedish Air Force, who put up a long-distance record recently, was flying at the beginning of the month on an 110 h.p. Albatros and crashed in a wood at Malmslätt, breaking his thigh badly.

RUSSIA.

Official Communiques.

General Denikin.

Oct. 6th.—In the region of Fastoff and Izotoff British aviators, flying exceedingly low, dispersed the Red Cavalry.

Esthonian.

Oct. 5th.—Esthonian aviators observed the Bolshevist rearguards hurriedly retiring through Pskoff.

A Newspaper Yarn.

On Oct. 11th it was reported that after a bombardment from aeroplanes Riga was occupied by German troops.

Mr. Arthur E. Mann, writing in the "Daily Express" of the German advance in Russia, says on Oct. 9th that as he was returning from a motor-car journey to the Latvian-Russo-German front at St. Olai on the main road from Riga to Mitau, he witnessed an attack by German aeroplanes which he describes as follows :—

An artillery duel was in progress. After a few moments four German aeroplanes, with the Iron Cross painted on them, came over the lines and began bombing the Lettish gun emplacements and directing the German fire. I retreated to my motor-car and started back.

Suddenly an aeroplane swooped down until it was only about a hundred yards overhead, and put four bursts of machine-gun fire into the road ten yards ahead of my motor-car, which was racing ahead at 50 miles an hour. The German airman would undoubtedly have obtained our range in a moment or two, but, as we came round a bend, a Lettish armoured car with a machine gun opened fire and drove him off.

Aeroplanes under Admiral Koltchak.

It is reported that a number of French aviators have arrived at Krasnoyarsk with their machines. These aviators are to operate with the forces of Admiral Koltchak.

Aeroplanes on the Tsaritsyn.

The "Times" correspondent, writing from Rostoff-on-Don on Sept. 30th, stated that on the Tsaritsyn front, where the Bolshevists continue to attack in force, General Wrangel's inferiority in man-power is compensated by the use of tanks and aeroplanes and the mobility and dash of his cavalry.

U.S.A.

Aircraft in the U.S. Navy.

It was officially announced on Sept. 13th that all U.S. warships are to be equipped with seaplanes. This policy is in connection with that of building a large fleet of airships, and is part of the U.S. Navy's scheme of coastal defence.

A Mexican Apology.

On Sept. 2nd, while flying on border patrol duty along the Rio Grande, Capt. McNabb and Lt. Johnson, U.S. Army, were fired on by a detachment of about twenty-five Mexican soldiers concealed in the brushwood near Santa Isabel Creek. Capt. McNabb, the pilot, was wounded in the head, and the observer had to bring the machine down on American territory. The State Department made a formal protest to the Mexican Foreign Office, which has now expressed regret and promises an exhaustive inquiry into the incident.

Military Training in Aeronautical Engineerigg.

The following piece has been extracted from the "Congressional Record" (the American "Hansard"), for Sept 8th :—

The Bill (S.2733) to provide for the training of officers of the Army in aeronautic engineering and the issue of equipment and materials therefor was considered as in Committee of the Whole.

The Bill had been reported from the Committee on Military Affairs with an amendment, on page 2, line 1, after the word "appropriated," to strike out "and he is authorised to furnish to institutions to which officers are so detailed such equipment and material belonging to the War Department for use in connection with courses in aeronautic engineering as he may deem advisable, subject to such rules for use, compensation for use, accounting, report, and return as he may prescribe," so as to make the Bill read :

Be it enacted, etc., That the Secretary of War be, and he hereby is, authorised to detail such officers of the Army as he may select, not exceeding 25 at any one time, to attend and pursue courses of aeronautic engineering or associate study at such schools, colleges and universities as he may select.

Sec. 2. The Secretary of War is authorised to pay tuition for the officers so detailed and to provide them with necessary textbooks and technical supplies from any moneys available for the Air Service of the Army not otherwise specifically appropriated.

The amendment was agreed to.

The Bill was reported to the Senate as amended, and the amendment was concurred in.

The Bill was ordered to be engrossed for a third reading, read the third time, and passed.

The title was amended so as to read : "A Bill to provide for the training of officers of the Army in aeronautic engineering."

U.S. Army Airships.

Great attention is now being paid to airship training in the U.S. Army, particularly at Langley Field. There is at present only one airship at this station, but two or three more will shortly be commissioned. One of these may be the airship built by the Zodiac Company for the U.S. Navy in wartime. Its dimensions are :—Capacity, 219,000 cubic ft., length 236 ft., width, 49.2 ft., and height, 65.5 ft. Ten or twelve passengers can be carried and the cabin is a bower of luxury in accordance with the latest American taste.

Three officers are required for the proper navigation of this class of airship. One is in charge of the altitude controls and the maintenance of correct pressures in gasbags and ballonets. Another has control of the ship's course, and the third exercises general supervision as commanding officer.

In addition to this ship it is intended to send to Langley Field one or more of the "C" type airships which are used by the American Navy over coastal waters. These are of 175,000 cubic feet and made by the Goodyear Tire and Rubber Company.

A large hangar has been constructed which will house the Zodiac and two or three of the "C" class.

Thirty-two balloon and airship companies are being maintained on a peace establishment in the U.S. Army. Two officers are visiting aeroplane stations to induce volunteers to transfer to the "lighter than air" branch in order to make up the existing deficiency of 800.

Three Mullion type airships and three portable airship hangars bought from the British Navy arrived in the U.S.A. about one month ago.

Organisation of Air Service Units.

The following order is extracted from "Air Service News Letter" dated Sept. 30th, 1919 :—

The following Air Service units will be organised at the stations indicated, under Tables of Organisation, 1919, for the Air Service :—

Units.	Stations.
First Wing	Kelly Field, San Antonio, Tex.
Second Wing	Langley Field, Hampton, Va.
1st Day Bombardment Group	Ellington Field, Houston, Tex.
1st Surveillance Group	Kelly Field, San Antonio, Tex.
1st Pursuit Group	Selfridge Field, Mt. Clemens, Mich.
1st Army Observation Group	Park Field, Millington, Tenn.
1st Photo Section	Fort Bliss, Tex.
2nd Photo Section	Langley Field, Hampton, Va.
4th Photo Section	Langley Field, Hampton, Va.
6th Photo Section	Langley Field, Hampton, Va.
7th Photo Section	Langley Field, Hampton, Va.
11th Photo Section	Langley Field, Hampton, Va.
12th Photo Section	Canal Zone
14th Photo Section	Langley Field, Hampton, Va.
15th Photo Section	Langley Field, Hampton, Va.

The 1st Wing will consist of all groups and organisations engaged on work in connection with border duty. The 2nd Wing will exercise supervision of all units on the Atlantic Coast. The 1st Day Bombardment Group will consist of the 11th Day Bombardment Squadron, 20th Day Bombardment Squadron, 96th Day Bombardment Squadron, and 166th Day Bombardment Squadron. The 1st Surveillance Group will consist of the 8th, 90th, and 104th Surveillance Squadrons. The 1st Pursuit Group will consist of the 27th, 94th, 95th, and 147th Pursuit Squadrons. The 1st Army Observation Group will consist of the 1st, 12th, and 258th Army Observation Squadrons. The squadron organisations of these groups have been previously authorised.

The commanding generals of the Philippine, Hawaiian, and Panama Canal Departments will organise units in their departments as follows :—

Units.	Stations.
1st Observation Group	Philippine Department
2nd Observation Group	Hawaiian Department
3rd Observation Group	Panama Canal Department

The 1st Observation Group will consist of the 2nd and 3rd Observation Squadrons.

Telephone : WILLESDEN 2455.

Telegrams : "NIEUSCOUT, CRICKLE, LONDON."

The 2nd Observation Group will consist of the 4th and 6th Observation Squadrons.

The 3rd Observation Group will consist of the 5th and 7th Observation Squadrons.

By order of the Secretary of War :—

PEYTON C. MARCH,
General, Chief of Staff.

AN AMERICAN GRANT.

A Reuter message from Washington states that the Senate Military Committee recommended an appropriation of $15,000,000 on Oct. 10th. This sum of money is for the construction of Army aircraft in connection with the establishment of air routes to Panama, Alaska, and probably Asia.

Early in August of this year the Navy and Army asked Congress for a grant of $129,000,000 for the current year. The grant given was only $50,000,000.

THE DESIGNER OF THE LIBERTY ENGINE.

Mr. J. G. Vincent, vice-president of the engineering section in the Packard Motor Car Co., and one of the many designers of the Liberty motor, has been given a commission as Colonel in the Officers' Reserve Corps in the U.S. Army. His unit is the Aviation Section of the Signal Corps.

On joining the U.S. Army in 1917 he was given a commission as Major, and was later promoted Lt.-Col. He was pressed after the Armistice to accept a commission in the Officers' Reserve Corps as a Major—then the highest rank available for first appointment. Since that time an Enabling Act has made it possible for him to be given a higher rank.

THE TRANSCONTINENTAL AIR RACE.

A great military air race of 5,400 miles from New York to San Francisco and back and vice versa started on Oct. 8th. One of the chief objects of the contest is to arouse the United States Congress to interest itself in the desperate position of American aviation, and to inspire Congress to pass legislation providing funds to develop a distinct Department of Aviation.

Sixty-seven machines were entered for the Westward flight and back, and 16 at San Francisco for the Eastward flight and back. The competition rules stated that all flying was to be done between sunrise and sunset only, and would be suspended on Sunday.

The majority of the machines entered are D.H.4s with 400 h.p. Liberty engines. One of that type is expected to win the race, as, in addition to the number in the contest, spare parts can be obtained for the Liberty engines at any of the 21 stopping places or control stations on the route. An Italian S.V.A. was entered for the race, and said to have a speed of 135 m.p.h. A captured Fokker was also expected to fly.

The course of the race was very severe. The machines started from sea-level, and had to cross the Rocky Mountains at 6,600 ft., where all varieties of weather and temperature were expected.

The first starter from Mineola, New York, was to have been Air Commodore L. E. O. Charlton, Air Attaché at the British Embassy, Washington. He was accompanied by Flying Officer T. Traill, R.A.F. Their machine was a Bristol Fighter, with a 275 h.p. Rolls-Royce engine. They were given the place of honour as an international courtesy.

The Bristol Fighter developed petrol supply trouble at the last moment. This was eventually remedied, and the machine was the eleventh to ascend at 9.34 a.m. Air Commodore Charlton crashed into a fence near Ithaca, New York, at 2.20 p.m , owing to engine failure from carburetter trouble, and so was put out of the race.

Some 48 machines started from Roosevelt Field, Mineola, at intervals of two minutes, the first leaving at 9 a.m. At the same time, 15 aeroplanes left San Francisco for the flight eastward.

Three aviators were killed and six machines crashed on the first day, Oct. 8th. Major D. H. Chrissey, who started from San Francisco, was killed with his observer, when their machine fell near Salt Lake.

Serjeant W. H. Neavitt, the observer in a De Havilland, piloted by Colonel Gerald C. Brant, was also killed when their machine crashed by Deposit, New York. Colonel Brant was badly bruised.

Another machine, piloted by Capt. D. B. Gish, burst into flames in mid-air. He was carrying as a passenger, Capt. Delavergne, the French Air Attaché. Capt. Gish succeeded in landing safely despite the fire, but his machine was destroyed.

Air Commodore Charlton and the French Air Attaché were the only representatives of the Allies in the race. Capt. Delavergne returned to Mineola intending to re-enter the contest in another machine.

Lieut. Belvin Maynard, the winner of the recent New York to Toronto flight, had covered the furthest distance on the night of Oct. 8th. That night he landed at Chicago and was 155 miles ahead of his nearest competitor. He was flying a De Havilland 4 with a Liberty engine, and had not had the slightest trouble en route.

The distance from New York to Chicago is 710 miles. Lieut. Maynard covered the distance at an average speed of 120 miles per hour. None of the aviators who started from San Francisco equalled the distance covered by the leaders in the Western flight on the first day. The machines which flew furthest only reached Salt Lake City, Utah.

On Oct. 9th, Lieut. Maynard left Chicago at 7.10 a.m., and hoped to reach San Francisco on that day at sunset. Rain and high winds were reported from New York to Illinois.

Two further accidents occurred on Oct. 9th. An aeroplane going westwards fell into Lake Erie in the morning. The pilot, Lieut. Hynes, and his observer, were rescued. Another machine was wrecked at Lockport, New York.

In all, nine machines were put out of the race on Oct. 8th.

On Oct. 9th Lieut. Maynard met Capt. Lovell Smith, who was then the leading aviator, flying eastward at North Platte, Nebraska. At that point Lieut. Maynard had 1,210 miles to fly to reach the Pacific, and Capt. Smith had 1,497 miles to reach the Atlantic. After hearty greetings and a brief rest, the pilots flew on, and Lieut. Maynard continued 205 miles to Cheyenne, Wyoming, where he spent the night.

A Reuter message from Chicago stated that he was delayed there by a broken airscrew, but no further confirmation of the report has been received.

Almost every kind of weather was encountered on the route, snow, rain, winds in various strengths, and also ideal flying conditions. One military pilot, Lieut. E. V. Wales, died on Oct. 10th, after crashing into a mountain in a D.H.4 near Saragota, Wyoming, in a blinding snowstorm. His observer escaped with minor injuries.

Lieut. Maynard reached San Francisco at 4.12 p.m. (New York time) on Oct. 11th, and completed the flight one way across the Continent. His time is given unofficially as 72 hrs. 47 min., and his actual flying time is esitmated at 24 hrs. 58 min. 55½ sec. Lieut. Maynard's flight was made with clockwork regularity and without any exciting incident.

The rules of the race require a stay at the halfway furthest point of the flight for two days before starting on the return journey, and also that no flying shall take place on Sunday. Lieut. Maynard hoped to beat his competitors by including Sunday as one of the two days he is required to stay in San Francisco.

But two other competitors completed half their journeys on the Saturday by arriving at New York practically simultaneously at 6.35 p.m. They are Major C. Spatz and Lieut. E. C. Kiel, whose total times respectively are given unofficially as 83 hrs. 41 min. and 83 hrs. 44 min.

Major Spatz stated that he crossed the Rocky Mountains at 12,000 ft. It was so cold that he feared that the carburetter would freeze. At other times dense snowstorms prevented him from seeing more than 50 ft. ahead, and he narrowly escaped dashing into the side of a mountain.

All the machines which finished half the course on Oct. 11th were flying D.H.4 biplanes, fitted with 400 h.p. Liberty engines. One control station at Green River, Wyoming, had to be cut out of the course, because heavy snows made landing there dangerous. One S.E.5 was included among the 43 other competitors scattered along the course.

Capt. L. H. Smith, the fourth aviator to complete the Transcontinental flight, reached Mineola from San Francisco on Oct. 13th. According to the Exchange Telegraph Co. the actual time taken by Capt. Smith was 24½ hours, nearly half an hour faster than that of Lieut Maynard. Capt. Smith lost his airscrew just before reaching Cleveland, and thus lost the lead of the eastward bound competitors.

Major Spatz has announced that if he can obtain the permission of the War Department he will abandon the flight back to San Francisco. He wishes to experiment on a Texas flying ground

A Reuter message from New York on Oct. 12th stated that notwithstanding the fact that Army Air Service authorities at Washington announced that the return flight across the Continent would begin on Oct. 20th, it is now intimated by the American Flying Club that the race may be discontinued, or, if continued, the route may be changed to the southern part of the United States, in order to avoid the severe weather encountered on the northerly route.

THE CHINESE LOAN.

It was announced on Oct. 13th that Vickers, Ltd., are shortly offering for sale the Chinese Government Eight per Cent. Sterling Treasury Notes repayable between 1925 and 1929. Vickers, Ltd., hold these Notes as payment for a number of commercial aeroplanes built by them for the Chinese Government.

MORTGAGES AND CHARGES.

HANDLEY PAGE, LTD.—Satisfaction in full on June 3rd, 1919, of £100,000 debenture, dated Feb. 4th, 1918.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

GREAT BRITAIN.

CIVIL AERODROMES.

The Air Ministry made the following announcement on Sept. 27th :—

The following lists of aerodromes are issued as an addition to the lists already published. It will be seen that some of the aerodromes can only be considered as possible emergency landing-grounds. These lists are purely provisional and subject to alteration or amendment from time to time.

LIST D (d).

Aerodromes licensed as suitable for "Avro (504 K) and similar types of aircraft" only. Except in very few instances, accommodation does not exist. The licences have also in the majority of cases been issued for limited periods only.

Aerodrome.	Location of Aerodrome.	Nearest large town.
Blackburn	Finniscliffe Bridge, Blackburn	Blackburn.
Cathcart	Adjoins Kennishead Junction	Glasgow.
Cheltenham	Between villages of Swindon & Uckington	Cheltenham.
North Berwick	Adjoins Railway Station	North Berwick.
Walsall	Millish Rd., nr. Rushall Canal	Walsall.
Wolverhampton	Bridgnorth Road, Perton	Wolverhampton.

LIST E (b).

STATIONS NO LONGER IN USE BY THE R.A.F.

These stations have been passed to the Government Surplus Property Disposal Board. They will be relinquished as soon as the Government property thereon has been disposed of. In many cases the aerodromes are now under cultivation, but it is probable that the sites still form the best emergency landing-grounds in the immediate neighbourhood.

Aerodrome.	Nearest Rly. Stations and distance in miles.	Nearest Town and distance in miles.
Beverley	Beverley, N.E.R. (1)	Beverley (1).
Chattis Hill	Stockbridge, L.S.W.R.(2)	Winchester (10).
Doncaster	Doncaster, N.E. and G.N.R. (1¼)	Doncaster (1).
Elsham	Barnetby, G.C.R. (2¾)	Barton-on-Humber (6).
Penston	Macmerry, N.B.R. (1)	Haddington (5).

THE CONTINENTAL AIR SERVICES.

A PRIVATE LONDON-PARIS AIR SERVICE.

The honour of being the first firm in Great Britain apart from those directly in the Aircraft Industry to start their own commercial aeroplane service has fallen to S. Instone and Co., Ltd., steamship owners and ship-brokers, etc. As stated in THE AEROPLANE of October 1st, they have bought from the Air Ministry a D.H.4 biplane fitted with a 350-h.p. Rolls-Royce Eagle VIII engine.

The machine was to have made its first crossing to Paris on October 2nd, but it was then not quite ready, and the pilot, Lieut. F. L. Barnard (late R.A.F.), was called up for service during the railway strike.

The original offices of the firm are at Cardiff. In order that the employees there might see it, the machine was flown there recently. On the morning of October 13th, Lieut. Barnard flew it back to Hounslow. S. Instone and Co. state that the journey was completed in 56 minutes. The distance from Cardiff to Hounslow is at least 130 miles. As would be expected, the machine is capable of very considerable speed.

The machine left Hounslow for Le Bourget aerodrome (Paris) at about 12.30 p.m. on the same day (Oct. 13th). Samples and other light goods were carried and also letters from Mr. Stanley Machin, of the London Chamber of Commerce, to the chairman of the British Chamber of Commerce in Paris, and of the French Chamber of Commerce.

If they find that the aeroplane service pays, the company will buy other machines and perhaps start a daily service to Paris. They also hope to connect up by air with their offices in Italy. The one machine will fly from London to Paris whenever it is required, but it can hardly be expected to do the return journey more than three times a week.

THE AIRCO SERVICE

The service to Paris run by Aircraft Transport and Travel, Ltd., continued during the past week without interruption, although the weather on some of the days was not very favourable for flying. Owing to the demand for the transport, an additional machine was put on the service on four days out of the six on which the service ran.

Seven weeks of continuous flying has now been successfully completed with an approximate mileage of 24,750 miles, 232 hours in the air and at an average speed of 106½ m.p.h.

Date.	Type.	Pilot.	Left Hounslow	Arr. Paris.	Left Paris.	Arr. Hounslow.	Pass.
Oct. 5th	D.H. 4a	Lt. Powell	12.33 p.m.	2 48 p.m.			1
	D.H. 16	Lt. McMullin			12.30 p.m.	2.55 p.m.	4
Oct. 7th	D.H. 4a	Lt. Chattaway	12.38 p.m.	3 00 p.m.			1
	D.H. 4a	Lt. Powell			12.30 p.m	2.50 p.m.	1
Oct. 8th	D.H. 16	Lt. McMullin	12 50 p.m.	3 20 p.m.			4
	D.H 4a	Lt. Shaw	12 50 p.m.	3.00 p.m			1
	D.H. 9	Capt. Baylis			12.30 p.m.	2.43 p.m.	0
Oct. 9th	D.H. 16	Lt. Powell	12 43 p.m.	2.50 p.m.			4
	D.H. 9	Lt. Armstrong	1 00 p.m	3 10 p.m.			1
	D.H. 4a	Lt. Chattaway			12.30 p.m.	2.58 p.m	0
Oct. 10th	D.H. 16	Capt. Baylis	12.43 p.m.	3.00 p.m.			4
	D.H. 4a	Lt. Shaw			11.06 a.m.	12.55 p.m.	1
	D.H. 16	Lt. McMullin			12,30 p.m.	3.15 p.m.	3
Oct. 11th	D.H. 4a	Lt. Chattaway	1 07 p.m.	3 30 p.m.			2
	D.H. 4a	Lt. Lindley	1.04 p.m.	3.35 p.m.			1
	D H. 16	Lt. Powell			12.30 p.m.	2.50 p.m.	2

The weather conditions during the week were not good over the Channel. On October 6th there was drifting fog; on October 9th there was a 40 m.p.h. wind, and on the next day also there was a strong wind over the Channel.

Prospective passengers are now booking seats as far as a month ahead. The improvements in the organisation now make it possible for passengers to be picked up by motor-car for Hounslow at any point within a mile of Piccadilly Circus.

Going by air there is only one ticket and one vehicle. Irritating delays are avoided. The business man in a hurry saves more than four hours on the journey in actual time. Assuming he only values his time at a few pounds per hour the difference between the twenty guineas fare by air, and that of the ordinary land and sea route is no extravagance: it is a sound business proposition.

THE HANDLEY PAGE SERVICE.

Owing to the policy of Handley Page Transport, Ltd., it is difficult to obtain any information as to their services to Paris and Brussels. But one assumes that they are proceeding as usual.

The Company's latest innovation is the provision of luncheon baskets for passengers. The "basket" is really a carton in which are to be found six sandwiches, and fruit and chocolate. Orders for the baskets, which cost 3s., should be given in advance. Wicker holders for bottles and glasses are to be fixed to the walls of the cabins of their cross-Channel machines.

THE LONDON-AMSTERDAM AIR SERVICE.

On Tuesday, Oct. 7th, the British Aerial Transport Company dispatched a saloon passenger machine, piloted by Mr. Cyril Turner, to Amsterdam, at 12.50 p.m. This machine carried 600 lb. of merchandise and returned from Holland on Friday afternoon, 10th instant, with the full complement of passengers (i.e., four)

On Tuesday morning, Oct. 14th, the British Aerial Transport Company, Limited, dispatched a passenger saloon machine to Amsterdam from Hounslow, piloted by Mr. C Turner. Passengers and merchandise were carried. The return journey will be made from Holland on Thursday.

LONDON.

HOUNSLOW.—On Friday morning, 10th instant, Major C. Draper, D.S.C. (late R.N.A.S.) left Hounslow piloting a saloon passenger machine of the British Aerial Transport Company for Paris. The journey was completed in 2 hours 20 min. This machine was specially chartered, the passengers being Sir Percival Perry, Colonel Warwick Wright, D.S.O., Major Lennard, and Mr. Van den Bergh. It is expected that the party will return to-day (Wednesday, 15th instant).

NORTHOLT.—The Central Aircraft Company did their usual flying during the week ending Oct. 4th. Flights were made, with newspapers as cargo, to several towns on the East Coast. Post Office mails were carried to Bristol. Apart from the flights made over London, passengers were carried to Paris and Amsterdam

BRIGHTON.

On Saturday, 11th inst., the Avro Company organised an aerial carnival at Brighton on a scale not previously witnessed, at least in the South of England. At 10 a.m. eight Avros started from Hounslow in close formation under the command of Major McMinnies and Major A. G. Taylor. The mist was thick in the morning, but they flew comparatively low across country, and at Brighton joined forces with the Avros already there under the charge of Capt. Kennard. The other pilots who took part in the display were Capts. Davis and Le Blanc Smith and Messrs. Park, Sadler, Sullock, Broad, Pitt, Sparks, and Weeks

The Ladies' Mile at Patcham had not proved a very convenient aerodrome, so a much better one had been secured at West Blatchington Farm, which is easily reached by road or rail from both Brighton and Hove. Admission to the ground was free, and a large crowd had collected to witness the performance.

Displays were given on Oct. 11th and 12th by these aviators. Several parachute descents were made by a woman. The crowd showed great interest.

WINDERMERE.

The Avro seaplane season has now finished on Lake Windermere. On Oct. 4th Capt. Pixton flew a machine over to Douglas to escort Mr. Moxon back on his land machine. He made two journeys from Windermere to Douglas and also alighted at Blackpool to pick up Mr. Moxon and take him back to fetch the second machine. The weather was perfect except for a thick mist, which made it difficult to find the way.

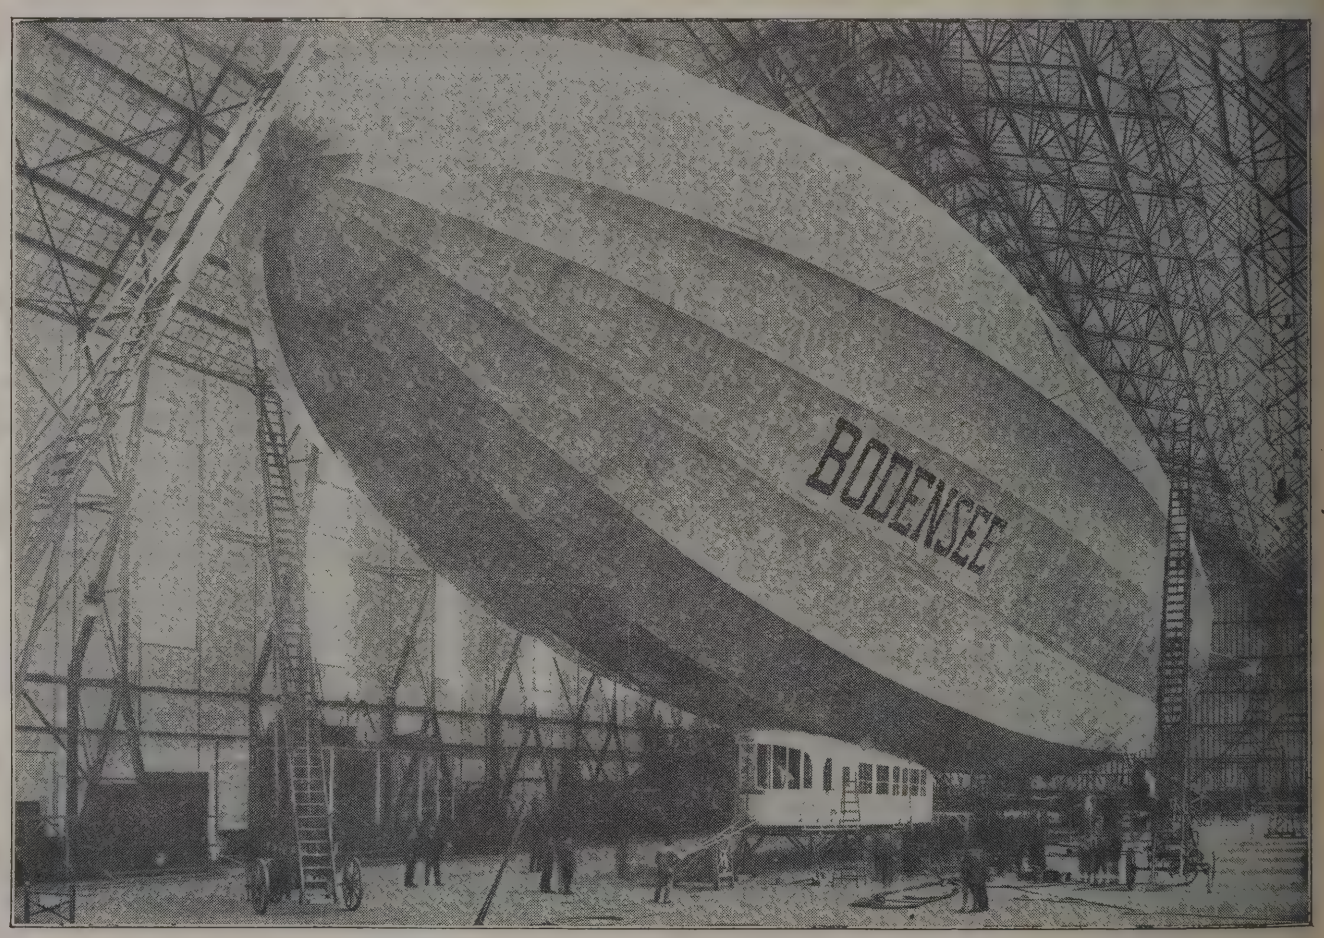
On Oct. 8th Capt. Pixton called at Blackpool by car and brought Mr. Moxon back from Windermere to fly one of the seaplanes to Blackpool, where it was to be fitted with a land chassis. On arrival at Blackpool it was found to be impossible to fit the land chassis without a lot of alterations, so Mr. Moxon flew the machine back to Windermere the next day, having to take off in a very rough sea.

NEW ZEALAND.

Apropos of the use of aeroplanes for submarine spotting during the war, it has been found that most of the larger species of fish can be easily seen from the air if the bottom of the sea over which they are swimming is suitable in colouring, and if the sea is not choked with seaweed. A good-sized mullet can be seen from an altitude of two or three hundred feet when it is swimming over sand. Smaller fish in shoals are easily visible.

Professor Joubin, of Auckland, proposes the establishment of regular patrols by seaplanes over the fishing grounds. These machines should be equipped with radio-telegraphic apparatus, and would notify the fishermen in the neighbourhood whenever a shoal of fish was "spotted."

The use of seaplanes would result in a great saving of the fishermen's time. It would also ensure a more economical use of expensive bait. One believes that even the British trawl-owners might add a little to their great wealth if they used aircraft for shoal "spotting."



FRANCE.

MM. GASTAMBIDE AND LEVAVASSEUR.

MM. Gastambide and Levavasseur, the former of whom was the original Chairman of the Antoinette Company, and the latter of whom was responsible for the design of the graceful Antoinette monoplane, have now produced an aeroplane with variable surface. Two satisfactory flights have been made, but no details are as yet available.

The world, with historic memories of the Antoinette, superb in its beauty, will welcome M. Levavasseur's return to aeronautics.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

The views of a number of aircraft manufacturing firms as to the future prospects of the Aircraft Industry and the policy which they propose to meet their estimate thereof will be found below.

Naturally all agree that there is no prospect of keeping their works fully employed on the construction of aircraft, but with two notable exceptions all the firms which have so far stated their views have sufficient faith in the future of aviation to have decided to keep their connection with the Industry and to carry on with experimental and development work.

This is as it should be, and the Industry will suffer little by the decision of large money-making concerns to close down their aircraft works for the time being as soon as the immediate prospect of profits therefrom vanishes.

Flying-boats originating from the Supermarine Aviation Works at Woolston are illustrated and described in "Modern British Aeroplanes" this week. The medium and small sized flying-boat presents a very interesting problem, and its exact sphere of usefulness is not yet conclusively settled.

The flying-boat in really large sizes has its own field undisputed, but it is still doubtful whether for small sizes the boat type will supplant the float seaplane or *vice-versa,* or whether each type will find its own uses.

In this connection the description of the Oertz flying-boats—the only German machines of the boat type which have persisted through the war—is distinctly interesting.

THE AIRCRAFT INDUSTRY'S VIEWS OF THE FUTURE.

In the present state of affairs the future policy of those firms who have been occupied during the war with the manufacture of aircraft on a large scale cannot fail to be of very great interest to all readers of THE AEROPLANE.

Letters of inquiry on this subject have been addressed to a number of such firms, and the following replies thereto, together with certain notes as to the firms' past activities, should prove illuminative.

SIR W. G. ARMSTRONG, WHITWORTH & CO., LTD.

Armstrong, Whitworth & Co., Ltd., entered the Aircraft Industry before the war in 1913. The A.W. F.K.3 with the 90 h.p. R.A.F. and the F.K.8 with the 160 h.p. Beardmore engine designed by Mr. Koolhoven and produced very early in the war both gave excellent results and were extensively used. Later Armstrong experimental designs, particularly the "Armadillo" and the "Ara," showed that the firm were capable of maintaining the high standard of their earlier productions.

Beside their aeroplane activities, Armstrong Whitworth successfully undertook the manufacture of rigid airships for the Admiralty.

In response to an inquiry as to their future policy this firm says:—

"In reply to your letter we would inform you that it is our intention to close down both our aeroplane and airship departments, owing to the curtailment of the Government aircraft programme.

"The stoppage of aircraft contracts and lack of policy as regards civil aviation has necessitated the discharge of our experienced staff and personnel.

"Inquiries made both in England and abroad as to the aircraft business to be obtained or contemplated show that it is so small as not to justify our going on with aircraft manufacture for some years to come."

BOULTON & PAUL, LTD.

Boulton & Paul, Ltd., of Norwich, were before the war well-known manufacturers of steel and wooden buildings and other types of structural engineering. Their entrance into aircraft manufacture was a result of war conditions. In addition to the production of large numbers of machines to official specification, the firm have, under the management of Mr. Geoffrey ffiske and with the assistance of Mr. J. D. North as chief designer, produced excellent machines of their own design. In particular the Boulton & Paul "Bourges" twin-engine fighter-bomber must be considered to be one of the most efficient large machines yet produced. It is therefore cheerful to hear that the firm are to keep their experimental department working on the development of new types.

Mr. ffiske says:—

"My company are amongst the fortunate ones that can turn their aircraft shops into their pre-war business, and I am pleased to say that the whole of our shops are nearly settled down to commercial work, which includes horticultural and agricultural appliances, wooden bungalows and cottages.

"We are keeping our experimental department fully employed on the development of new types and improvement of aircraft. We hope by this means to help, with others, in keeping British aircraft to the fore."

THE CENTRAL AIRCRAFT COMPANY.

This firm, founded during the war, was employed till the Armistice on the manufacture of machines to official specifications. Since then they have designed and built a number of machines for post-war purposes, and have put a flying school into operation at the Northolt Aerodrome.

They propose to continue the manufacture of their

machines for use at their school, for "joy-rides," and for passenger services which they run, and for sale at home and abroad.

As, however, the demand for machines is not expected to keep their works fully occupied at present, they have taken up a number of other classes of work, and are busy on the construction of furniture, toys, motor-lorry bodies, car repairs, and general engineering and woodwork.

The Gnôme and Le Rhône Engine Company.

There is little need here to dilate upon the services rendered to the Aircraft Industry generally by the Gnôme and Le Rhône engines. The Gnôme and Le Rhône Engine Company, who own the British rights in these engines, say that at present their works are chiefly occupied with work in connection with the automobile industry, and that they are devoting attention to the development of engines for such work.

The aero-engine and the experimental departments are being maintained, however, though naturally the aero-engine output has been greatly reduced.

D. Napier & Son, Ltd.

The makers of the famous Napier cars were one of the first of the firms who diverted their normal activities to assist in the construction of aircraft.

In addition to the construction of actual aeroplanes to Government order and specification, the firm turned its equipment onto the production of engines, turning out large numbers of engines of R.A.F. design, and also developing, under severe difficulties, their own now famous three-row 12-cylinder engine of 450 h.p.

Since the advent of peace D. Napier & Son, Ltd., have ceased to build aeroplanes, but they have been enabled convincingly to demonstrate the qualities of their engine.

Their works are mainly employed in the manufacture of private and business motor vehicles.

As to the aeronautical side of their business the firm state :—

"We have every confidence in the ultimate success of commercial aviation, and are continuing with our programme to manufacture the 450-h.p. Napier aero-engine, which has already proved itself thoroughly reliable and airworthy, with the result that we have every reason to anticipate business resulting in due course."

The Sopwith Aviation & Engineering Company, Ltd.

The Sopwith Company, under the direction of Mr. T. O. M. Sopwith, are of the earliest of the pioneer aeroplane constructors. The work which they have done towards securing the ascendancy of the British aircraft for war purposes is familiar to everyone, and an attempt to catalogue their achievements here is quite unnecessary.

In response to an inquiry as to their views of the future, Mr. Sopwith has supplied the following statement :—

"The civil aviation situation, as it presents itself at the moment, is, I suppose, one of the most difficult problems that the Aircraft Industry has ever had to tackle.

"The era of peace has hardly yet really dawned, as aeroplanes cannot be exported to certain countries (and some of them are the most interesting from a civil aviation standpoint) without special permission, which in some cases it is impossible to grant, owing to the disturbed state of these countries. Apart from this, however, it would seem that the future progress of civil aviation resolves itself into three main heads :—

"(1) The obtaining of data as to costs, the averages of days flown during the year, and definite information as to reliability and consistency of any given service.

"(2) The education of the non-flying public by propaganda, etc., showing the possibilities of aerial transport, educating them as to the danger aspect—*i.e.*, that it is not nearly as high as the lay Press very often puts it—and generally actively to impress on the non-flying world the high practicability that aerial transport has reached.

"(3) The establishment at the earliest possible moment of aerodromes and emergency landing grounds on all the main routes, and organisation generally in much the same way as the railways have had to build up an organisation.

"In a word, the situation is very similar, so far as the non-flying public are concerned, to the institution of railway travel. Until these three main heads have been adequately dealt with, I do not see any prospect of commercially remunerative activities for aviation firms.

"So far as the policy of my company is concerned, we propose actively to engage on experimental and competition work, and to follow the developments as facilities increase, but I think that, for the next several months, it is only reasonable to regard the civil aviation side of any aircraft business as in a state of semi-suspended animation.

"It is of vital importance that the chief designing firms should maintain, at any rate, a nucleus of their aviation staff and factory personnel, so that the *métier* may not be lost and the Industry become moribund. It is only possible to do this by, in the meantime, taking up the manufacture of products outside aviation, and of such a nature as to keep as far as possible the *status quo* as an aviation firm.

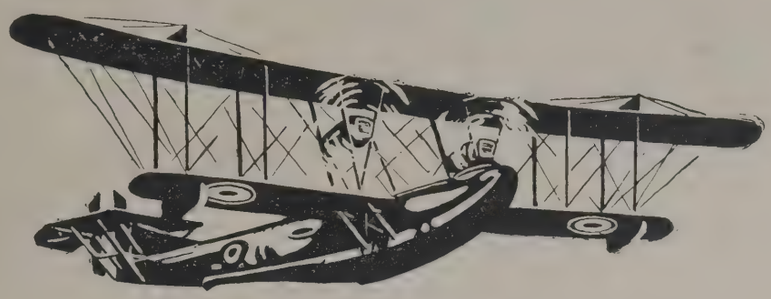
"As to the military side, this is at present wrapped in mystery. It is therefore impossible to estimate what prospect there will be for aviation firms having Government support in order to maintain an industry for military requirements.

"Of this I am sure that the aviation future, be it soon or late, is certain, but the only way to ensure its security is to hasten slowly."

J. Samuel White & Company, Ltd.

This well-known Isle of Wight firm of shipbuilders entered the Aircraft Industry some time before the war, and under the management of Mr. Howard T. Wright their aviation department produced the notable series of "Wight" seaplanes, an early example whereof was purchased by the German Government, and appears to have produced a permanent effect upon German seaplane float design.

In answer to a request for their views as to the future of the Aircraft Industry, J. Samuel White & Company, Ltd., say :—



"We regret we are not in a position to give you our views upon the future of Aircraft Industry, as we have definitely closed down our aviation department, and at present have no intention of reverting to aeroplane construction."

THE STANDARDISATION OF CHAINS.

The Association of British Driving Chain Manufacturers announce that they have now completed the standardisation of roller chains up to ¾-in pitch. For the convenience of chain users, and to insure complete interchangeability, they have also standardised chain wheel tooth forms. These new tooth forms, while not being identical with any of the existing forms, incorporate the essential features of each.

Particulars of the standards set up by the Association of British Driving Chain Manufacturers are to be published in pamphlet form, which will be obtainable from the Secretary of the Association of British Driving Chain Manufacturers, Bassishaw House, Basinghall Street, London, E.C.

The Association comprises the following well-known firms : Alfred Appleby, Ltd., Birmingham; Brampton Bros., Ltd., Birmingham; Perry and Co., Ltd., Birmingham; "The Coventry" Chain Co., Coventry; Hans Renold, Ltd., Manchester.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

THE BOULTON & PAUL—P. 9.

An Aeroplane which is a Sound Commercial and Private Proposition

In this P. 9 Machine we have, we feel, solved the problem of providing an Aeroplane which is a sound business proposition—and which combines with low cost the great essentials for Commercial and Private use. All our great resources of material and craftsmanship have been utilised. Scientific Research and Experiment by a staff associated with flying from its beginnings coupled with the great Experience gained through the building of thousands of Aeroplanes during the War, have been concentrated in the production of this P. 9 Model.

It is a Two-Seater—Single Engine Tractor—which has attained on test a speed of over 100 miles per hour.

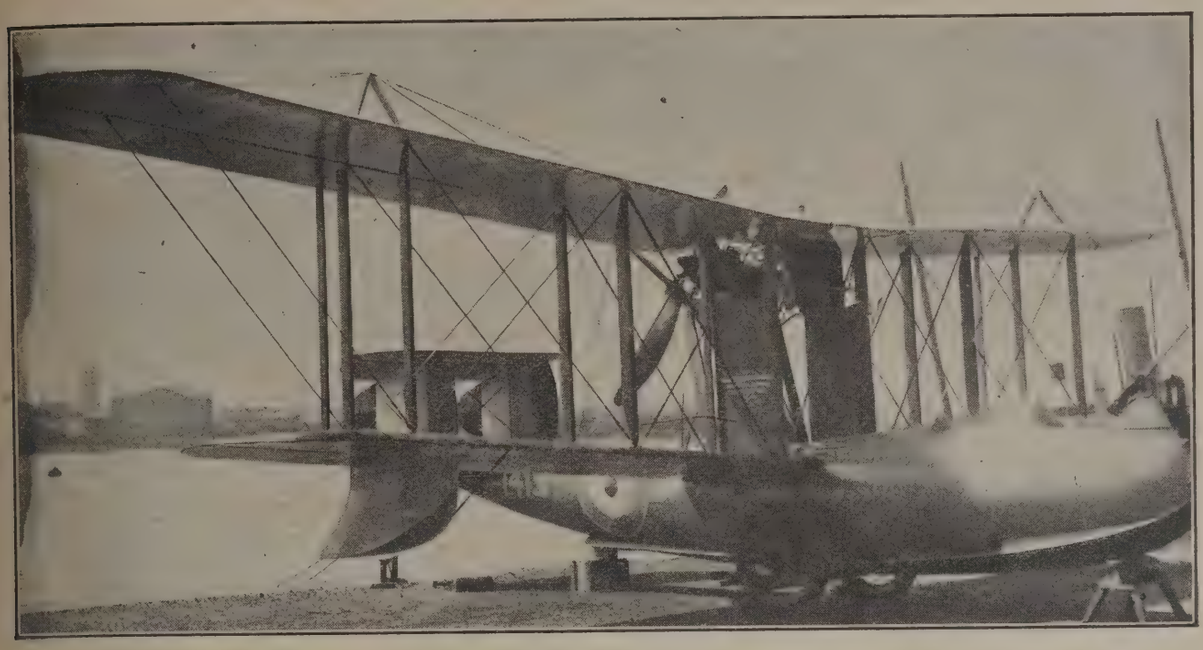
Its outstanding features are :—

CHEAP AND EASILY HOUSED. The Initial cost is extremely low—£700—and the cost of running for a machine of this type and performance is reduced to a minimum. Owing to its small size it is easy to handle on the ground and requires but little accommodation. The principal dimensions are: Span, 27 ft. 6 in.; Length, 25 ft.; Height, 10 ft.

EASY TO FLY. The P. 9 has a big speed range, and low landing speeds, and this combined with Stability at all trimming speeds and well-balanced controls, allows the machine to be flown for long periods without undue fatigue. It also gives the maximum of Safety possible.

COMFORT AND CONVENIENCE. The comfort of the Pilot and Passenger has been specially considered. Each Cockpit is roomy and fitted with our special Seats. Controls for both Flying and Engine are fitted in the fron and rear Cockpits to enable the machine to be flown from either position. The exhaust from engine is discharged behind the rear Cockpit giving a silencing effect and freedom from fumes. Two standard cases are provided for luggage and form part of the fairing immediately behind the rear Cockpit.

The uses to which this compact and efficient machine can be put are wide and various, and will suggest themselves to those who have been awaiting the stage of Aeronautical Development now reached by the P. 9. It can be used for dozens of Commercial Purposes. The same type carried photos from R. 34 direct to London. It has been sent to Australia for Sheep-runs—and will soon be in use in various parts of the world for Exploring Uncharted Territory, Examining Timber Tracts, Fighting Forest Fires, Carrying Mails to Distant Mines, Transition of Colonial Mails to Mail Steamers, and for General Patrolling and Police Purposes.



£700 **If you are interested—write for full particulars. State your needs or purpose, and our engineers will consider every detail closely—to advise soundly.**

MODERN BRITISH AEROPLANES.

XIX.—The Supermarine Aviation Works, Ltd.

Three-quarter Front View of a Supermarine A.D. Type two-seater (200 h.p. Hispano-Suiza engine).

The Supermarine Aviation Works, Ltd., were founded in 1912 by Mr. Noel Pemberton Billing as Pemberton Billing, Ltd. In those early days the firm produced some very interesting experimental flying-boats.

During the war Squadron Commander—as he then was—Pemberton Billing gave up all his interests in the firm and its title was changed to the present one, and Mr. Hubert Scott-Paine assumed control.

The firm produced during the period of hostilities many interesting machines, including the "Night Hawk" quadruplane, a machine doomed to insuccess by the absence of suitable engines, and the "Push Proj," a small, single-seat pusher fighter with an extraordinarily good all-round performance, which was built in some number to the order of the Admiralty.

In 1916 the firm were given orders to build an experimental flying-boat of Admiralty design. After many alterations and modifications introduced by the firm this machine—generally known as the A.D. boat—became a distinct success.

THE SUPERMARINE A.D. TYPE BOAT.

This machine was designed for sea patrol and reconnaissance work, and was a tandem two-seater, with a gunner-observer in the bow of the hull, with the pilot behind.

The hull was of the type associated with the name of Major Linton Hope, in that it was built up on a framework of approximately circular sections, composed of a number of fairly light longitudinal members tied together by very light and flexible rings of elm. This main skeleton is completely planked over with thin mahogany, and forms a tubular body which is extremely stiff against either bending or torsion.

At the same time it is not a rigid structure, in that all the ring elements of which it is built are flexible and capable of distortion into an oval section without damage—a quality

A Pusher Seaplane built by the Supermarine Works in 1916. Owing to the radial engine with which it was fitted not providing sufficient power the type was not reproduced.

Side View of the Supermarine "Baby" (200 h.p. Hispano-Suiza) with wings folded.

which acts as a very effective springing against "taxying" and alighting shocks.

Projecting fins which form the planing surfaces, also built on a framework of flexible timberings, are built onto the main tubular body to complete the hull. In practice this type of hull has given extremely good results on the water, and stands up well to the very worst weather.

The wing structure is of the usual biplane type, with a large overhang braced above from a pylon. The upper centre section is carried from four vertical struts, with a separate structure supporting engine and radiator between them.

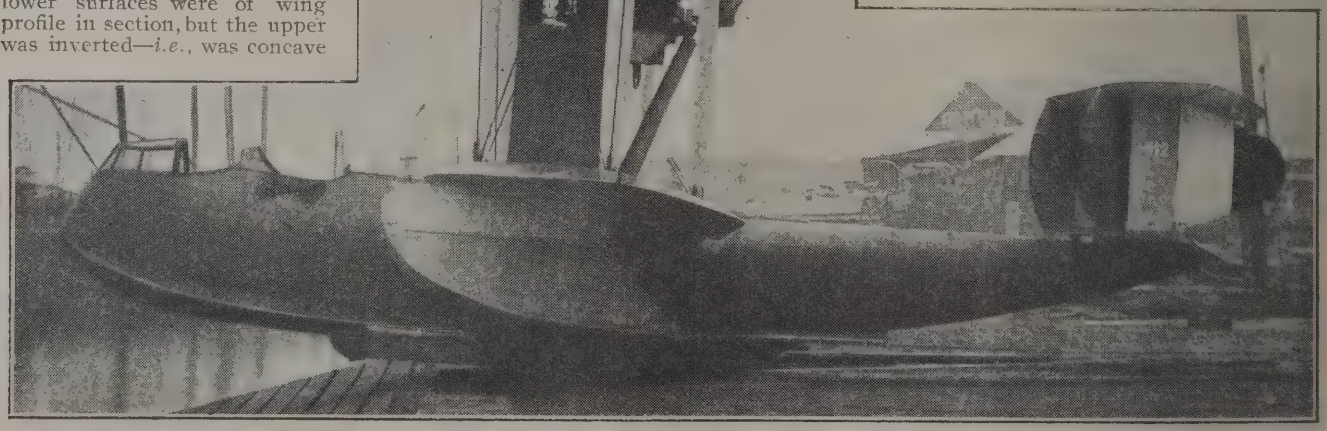
The wings are arranged to fold forward, hinging on the front spar, an arrangement which adds somewhat to the overall length folded. Folding to the rear in the ordinary way would have meant a longer hull to carry the tail clear of the wing bracing, with a considerably increased hull weight and an impaired manœuvrability.

The power plant consisted of a 200 h.p. Hispano-Suiza engine, a type of engine which never gave great satisfaction in these machines on account of continual trouble with the reduction gear and the propeller hub.

The tail unit was a biplane, with twin fixed fins enclosing the intertail struts, each having a rudder. The tail is curious in that the upper and lower surfaces were of wing profile in section, but the upper was inverted—*i.e.*, was concave upwards—whilst the under surface was in the usual position. The upper inverted surface working in the slipstream carried a heavy down load when the engine was running, and supplied a moment balancing that caused by the high thrust of the airscrew.

The machine was fitted with tanks for 4½ hours' full-power flight, Lewis gun and ammunition, and wireless.

With this load the machine gave an excellent all-round performance with a top speed in the neighbourhood of 85 knots.



Machines of exactly similar type, fitted with 160 h.p. Beardmore engines, and with increased passenger accommodation, are being used with great success by the Supermarine firm for their South Coast passenger services. No detailed specification of this type is available.

THE SUPERMARINE "BABY."

This was a small single-seater fighter boat designed upon lines somewhat similar to those of the previously described two-seater.

The hull was of the same type and construction as in the A.D. boat, though somewhat smaller.

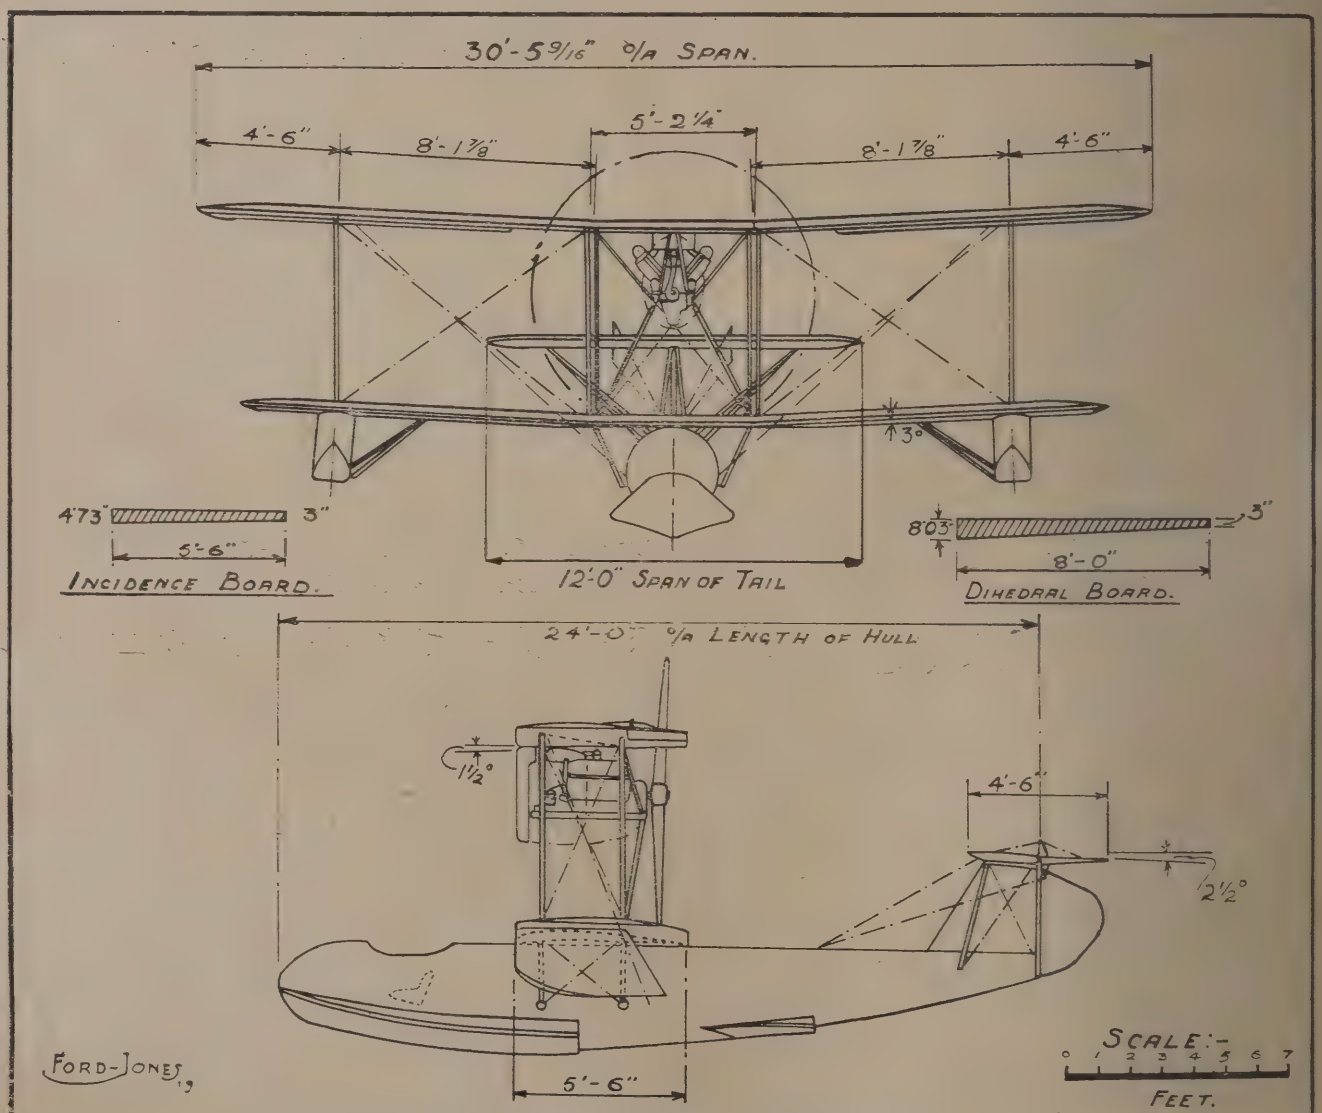
The wings were of reduced span, with a single row of struts on either side, and were made to fold in the normal way—backwards.

Side View of the Supermarine A.D. type boat (200 h.p. Hispano-Suiza engine).

"CELLON"

The Dope Of Proved Efficiency.

The "BRISTOL" FIGHTER Type F2.B.



In September, 1917, a Bristol Fighter was delivered from the "Bristol" works and put into commission in the fighting area. It was unfortunately landed in Holland and soon afterwards was acquired by the Dutch Government. From that time until now, though in continuous use by the Dutch Pilots, the **"CELLON DOPE"** has never been renewed and is still in perfect condition. The machine has never been repaired or renovated in any way, every unit being exactly as when it left the "BRISTOL" works.

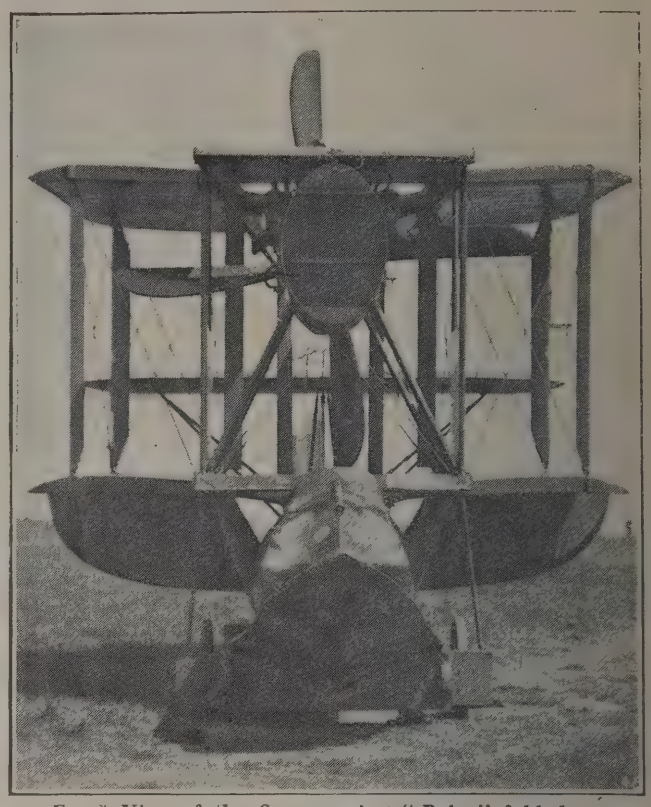
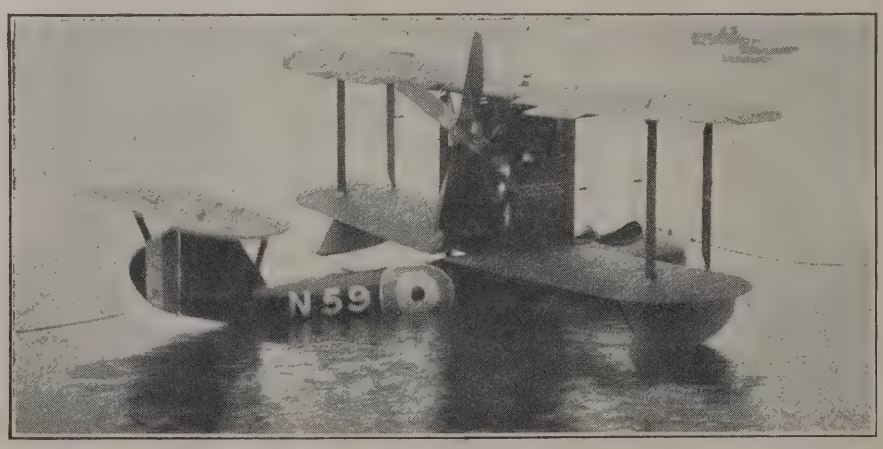
SUPERMARINE 3 SEATER FLYING BOAT.

Specification :—



Type of machine	Single-seater Flying-boat.
Name of machine	Supermarine "Baby."
Purpose for which intended	Single-seater Seaplane Fighter.
Span	30.5 ft.
Overall length	26.3 ft.
Maximum height	10.6 ft.
Chord	5.5 ft.
Total surface of wings	309 sq. ft.
Engine type and h.p.	Hispano-Suiza 150-h.p.
Weight of machine empty	1,699 lb.
Load per sq. ft.	7.5 lb.
Weight per h.p.	15.5 lb.
Tank capacity in hours	3 hr.
Performance—	
Speed low down	117 m.p.h.
Landing speed	57 m.p.h.
Disposable load apart from fuel	627 lb.
Total weight of machine loaded	2326 lb.

In addition to these machines the firm have the following designs in hand :—



Type A.—Small single-seater high-performance machine designed for a speed of 130 m.p.h. and a climb to 10,000 ft. in 8 min. The attached scale drawing shows that this machine is in general arrangement very like the machine which, fitted with a 450 h.p. Napier engine, was entered for the Schneider Cup Race.

Type B.—A twin-engined training flying-boat, shown in a scale drawing. The machine is fitted with dual control in two side-by-side seats, with an additional seat for passenger. Two 100 h.p. three-cylinder Cosmos "Lucifer" engines form the power plant, which should give a maximum speed of 90 m.p.h. With minor modifications this type becomes a three-seater sporting model.

Type C.—A small passenger or mail flying-boat for one pilot and three passengers or their equivalent. To be fitted with a Beardmore engine of 160 h.p.

Front View of the Supermarine "Baby" folded.

The Supermarine "Baby" on the water.

Type D.—A long-distance passenger, mail and commercial flying-boat of the tripiane variety, to be fitted with three Cosmos "Jupiter" engines of 500 h.p. each. Accommodation is to be provided for navigator, two pilots, and 24 passengers, or 1½ tons of mail or goods. A speed of 98 m.p.h. and a radius of 4 hours at that speed are hoped for.

Mr. Hubert Scott Paine, the Managing Director of the Supermarine Company, is firmly convinced of the practical utility of the boat type of seaplane, both for naval and for commercial purposes.

It may therefore be expected that Supermarine developments of the future will be at least as interesting as those of the past.

20 YEARS' PROGRESS.

Mann, Egerton and Co., Limited, have issued a souvenir booklet entitled "20 Years' Progress in Pictures," which gives a very complete history of that esteemed firm from their inception as electrical engineers to their present-day position as one of the largest motor and electrical engineering concerns in Great Britain.

Practically fifty per cent. of the illustrations show the various types of aircraft this firm built to their own and outside design.

Founded in 1899 as electrical engineers, the motor-car department was inaugurated shortly afterwards; and in 1905 the present company was floated with the object of amalgamating the motor and electrical departments under one management.

From that date until August, 1914, progress was steady and rapid, with the result that on the outbreak of war the company was one of the largest and best-known motor agency and electrical engineering concerns in the country, with branches at Norwich, Ipswich, Bury St. Edmunds, and London.

Naturally, on the outbreak of war the company undertook a considerable amount of war work, principally in connection with the motor industry, but with the increasing demand for aircraft, the firm were requested by the Admiralty to set up an organisation for the manufacture of seaplanes.

In order to cope with this work, the whole of the extensive coachbuilding factory as well as a large proportion of the motor repair and engineering works were handed over for the manufacture of aircraft. Additional works and shops were constructed in Norwich and an aerodrome of 60 acres was laid down.

In all, ten different types of aircraft were built for Service purposes, the total horse-power turned out being over 175,000.

Now that hostilities have ceased, the company have completed a comprehensive scheme of reconstruction, keeping their original business as motor engineers and coachbuilders first and foremost, but the aircraft branch will still be maintained with a view to future development in connection with civil aviation as well as their electrical departments and the manufacture of the "Willett Air Gas" system of lighting, of which they are the proprietors and sole manufacturers.

One feels sure that the firm of Mann, Egerton and Co., Ltd., will maintain the reputation they hold throughout Great Britain and the Colonies as agents of every make of car of repute, and also with regard to the system of service and repairs, the large repair depôts in Norwich, Ipswich, Bury St. Edmunds, and London being equipped with the latest machinery, and the completeness and efficiency of its organisation enables them to carry out repairs to any make of car promptly, skilfully and at strictly competitive prices.

First London to Madrid non-stop Flight

made by an aeroplane fitted with Napier Engine and B.T.H. Magnetos was completed in 7¾ hours. From the moment of leaving Acton to the landing in Madrid, engine and magnetos functioned perfectly, and never caused the pilots to have a single moment of anxiety.

The British Thomson-Houston Co., Ltd.,

B T-H

To "Aeroplane" Subscribers.

HOW TO SAVE ONE GUINEA, EIGHT SHILLINGS & NINEPENCE OR SEVEN & SIXPENCE.

The subscription list of the AEROPLANE, both at home and abroad, is steadily increasing: an eminently satisfactory movement which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, M.C., A.F.C., R.A.F., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

Subscribers who take advantage of this offer will have no reason to complain of the cost of their books.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" one year post free **(30/- inland; 35/- abroad** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

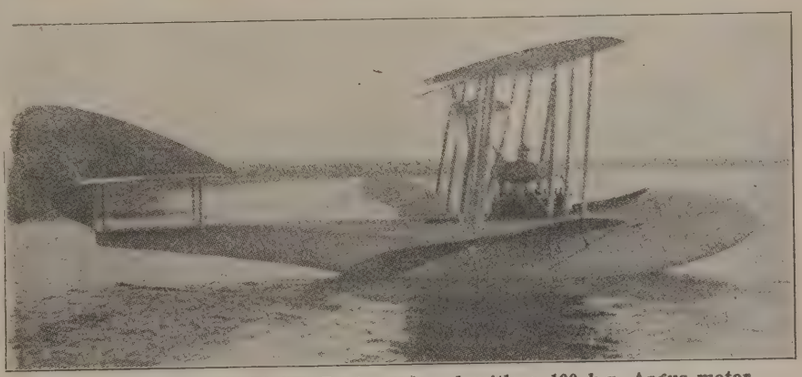
THE GERMAN OERTZ FLYING BOATS.

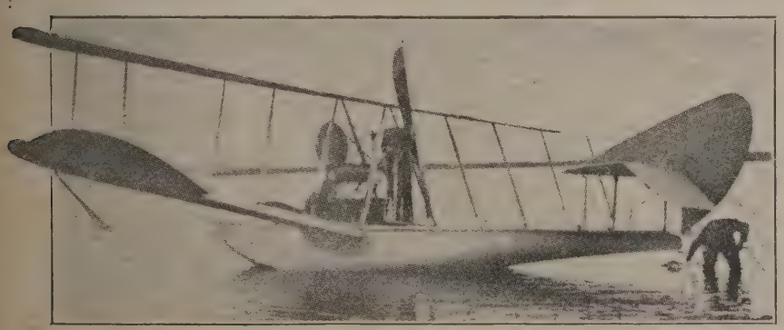


By ERIK HILDESHEIM (Copenhagen)

Oertz late 1915 Flying Boat, equipped with a 240 h.p. Maybach Airship Engine.

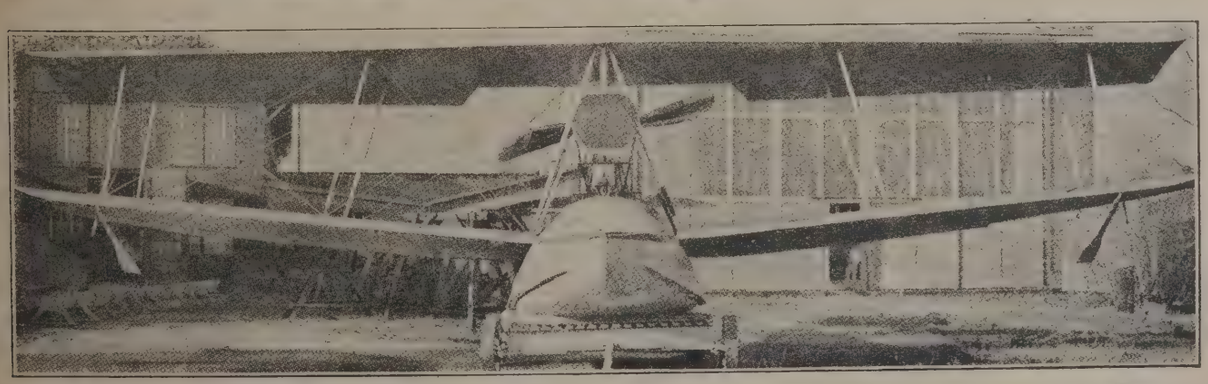
During the war the Germans stuck as exclusively to the use of seaplanes for their Naval Air Service as did the Austrians to flying-boats in the Adriatic, and the only practical German flying-boats, so far, were turned out by the yachting yard of Max Oertz at Hamburg, known as the designers of the ex-Emperor's racing craft "Meteor" and "Honenzollern."

The German view, apparently still unsettled, seems to be that as weights of seaplanes and flying-boats come out almost equal for horse-powers from 150 to 240 the former are more suitable up to 300 h.p., while both types will be employed in conjunction up to 700 h.p. Above that the weights are to the advantage of the flying-boats, so that big aircraft will always be of the latter type, showing, for instance, a saving of about two tons, compared with a 2,000-h.p. seaplane.



The first 1913 Oertz Flying Boat, equipped with a 100 h.p. Argus motor.

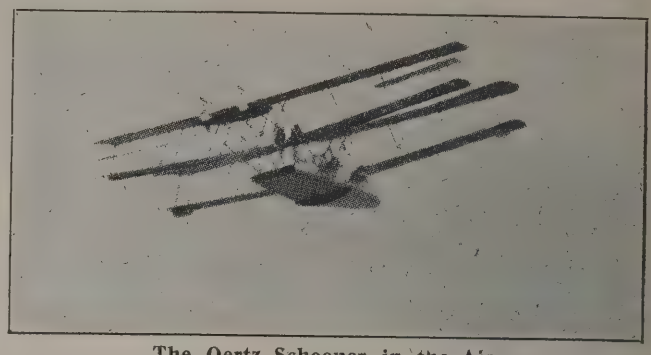
The first aeroplanes turned out by Oertz in 1910 were three-ply-wood clean bodied 70-h.p. Gnôme-engined monoplanes, piloted at a weight of 350 kilos. at speeds of 130 kilometres per hour, by the present director of the Dutch Trompenburg aircraft works, H. Wijnmaalen and the late Vollmoller, killed in experimental work with the Staaken multiple-engined giant biplanes.



When the firm's Deperdussin-trained engineer, Dax, was killed in a landing accident, aircraft work was stopped and not again resumed till 1913, when the Imperial Naval Office ordered a flying-boat, driven by a 100-h.p. Argus motor through spur-wheel gear.

The engine was mounted in the boat and the planes divided in the middle and combined by inclined struts, the lower ones being larger to avoid pendulum movements from the low-placed motor by keeping the centre of pressure as low as possible.

The hull had no steps, and owing to engine troubles no duration flights were carried out.



Two Oertz flying-boats of different models, both with engines in the hull and a gear-drive to the airscrew. Note the wing tip splashboards used in place of wing floats, and the upturned ailerons on the upper example. The upper picture is a 1914 type with 160 h.p. Daimler engine, the lower dates from 1917, and is fitted with the 240 h.p. Maybach engine.

The second flying-boat, provided with the first 160-h.p. Daimler-built aero engine, was turned out for the Warnemünde naval flying competition, abandoned owing to the outbreak of war.

Oertz Specifications.

An evidence of the Germans experiencing difficulties in engine manufacture both with regard to keeping production time and performance is to be found in the German Admiralty order for a series of Oertz flying-boats, to be equipped with 260 h.p. Argus engines, which got delayed in supply and turned out excessive in weight. So Maybach 240-h.p. airship motors, with reduction gears, were employed in autumn, 1915, and a flying-boat turned out especially for this engine model being presented to the navy by the Krupp proprietors von Bohlen and Halbach. The original wing-tip hydroplanes were replaced by ordinary wing floats. The main dimensions of the first Oertz boats were: hull length, 10.7 m.; beam, 2.5 m.; maximum span, 18 m.; total area, 77 sq. m. Useful load, 620 kg. The speed was 120-125 km.p.h. The main dimensions of the 1917 Oertz flying-boat, designed for the 240-h.p. Maybach motor were as follows: Length of hull, 9.96 m.; beam, 2.21 m.; span of top planes, 19.6 m., of lower planes, 15.6 m.; total area, 70 sq. m.; useful load, 641 kilos.; speed 140 km.p.h.

The Oertz Schooner in the Air.

The Oertz twin-engine Tandem (Schooner) Flying Boat taxi-ing.

The Oertz Schooner.

The last Oertz development was the twin-engined flying-boat along tandem lines, which on completion in 1916 was officially termed "flying schooner." The design was based upon model tests by Professor Prandl at Goettingen, and the speed obtained was 115 kilometres per hour with motors mounted side by side. The Sopwith "Bat-Boat" influence in hull design and tail support will be noted. To improve the banking capacity, ailerons of Curtiss fashion were later mounted between the rear planes. The dimensions of this aircraft were: hull length, 102 m.; beam, 3.16 m.; span, 20 m.; surface area, 163 sq. m.; useful load, 1.25 tons; maximum speed, 118 km.p.h. The drive was by two propellers resting on separate bearers.

The appearance of the large British and American flying-boats in the North Sea caused, on their own statement, the Germans to start work on similar aircraft, two such flying-boats for twin 300-h.p. propulsion being commenced by the Brandenburg works in co-operation with Oertz, who had completed the hulls of 16.5 metres' length at the time of the armistice being signed.

PRATT'S SPIRIT.

At the A.C.U. trials held recently, which were run from Llandrindod Wells, 10 gold medals and the Principality Cup were won by riders using Pratt's motor spirit.

J. SAMUEL WHITE & COMPANY, LTD.

It is officially announced that Mr. Frank Shearman, chairman and managing director of the Mount Stuart Dry Docks, Ltd., Cardiff, has been appointed to a seat on the Board of Messrs. J. Samuel White and Co., Ltd., the well-known shipbuilders and engineers of Cowes, Isle of Wight. Mr. Shearman is connected with several engineering and ship repairing establishments in South Wales, and is also chairman of the Times Shipping Co., Ltd., of Cardiff.

BARIMAR FOOTBALL CLUB.

The secretary of the Barimar Football Club requires fixtures for the coming season—both home and away—from October 11th onwards. Secretaries of medium teams with open dates are asked to communicate with Mr. W. Pritchard, care of Barimar, Ltd., 10, Poland Street, Oxford Street, W.1. Barimar ground adjoins Sudbury Town (Harrow) Station.

On Sept. 30th M. Sadi Lecointe, fresh from his brilliant attack on the speed records, made the first trials of the Blériot giant biplane at Buc. So far as is known the trials were satisfactory. This "aerobus" is designed to carry twenty-eight passengers, and is fitted with four 300-h.p. engines. The speed is said to be roughly 90 miles an hour. The engines are started by a compressed-air device.

THE PARIS-MELBOURNE FLIGHT.

M. Poulet, who intends to attempt a flight from Paris to Melbourne on a twin-engined Caudron biplane, left Issy-les-Moulineaux on Oct. 12th at 9 a.m. on the first stage of the flight. The prevalence of fog made him return half an hour later. At 10.30 a.m. he again made a start, but after flying 30 miles decided that the weather conditions were entirely unfavourable and so returned to Issy.

THE HOMOLOGATION OF RECORDS.

The Commission Sportive Aeronautique of the Aero Club de France has homologated the following height records for submission to the Fédération Aeronautique Internationale.

Pilot alone. Issy les Moulineaux, June 14th, 1919. By Lieut. Casale. Height, 31,230 ft.

Pilot and one passenger. Issy les Moulineaux, Aug. 8th, 1919. By Maurice Walbaun. Height, 24,836 ft.

Pilot and one passenger. Villacoublay, Aug. 13th, 1919. By Jacques Weiss. Height, 29,528 ft.

This last record was made on a Breguet biplane, the engine of which was fitted with a Rateau turbine.

THE COUPE DEUTSCH.

The third and last prize (amounting to 20,000 francs), under the terms of the Coupe Deutsch de la Meurthe (Circuit de Paris) is now open to competition between Oct. 13th, 1919, and Oct. 13th, 1920. The following entries have already been received by the Aero Club de France.

Sadi Lecointe on a Spad-Herbemont biplane (300 h.p. Hispano-Suiza).

Maurice Rost on a Gourdon Leseurre monoplane (180 h.p. Hispano-Suiza).

Soc. des Etab. Nieuport. Two entries. Bernard de Romanet on a Nieuport biplane (300 h.p. Hispano-Suiza), and M. Jansen on a Nieuport monoplane (180 h.p. Le Rhône).

The course over which the contest will take place is the Chateau de Saint Germain—Senlis—Meaux—Melun—Chateau de Saint Germain.

A WOMAN AIRSHIP PILOT.

Mlle. Gaby Morlay, a well-known actress, has now passed the tests for her certificate as an airship pilot. She is the first woman to whom an airship certificate has been issued.

THE PARIS SALON DE L'AERONAUTIQUE.

From a correspondent :—

The greater number of British firms exhibiting at the Salon have applied so late for space that they are more likely to be given stands in the annexe than in the main building.

THE PRIX PEUGEOT.

On Sept. 8th M. Poulain made another attempt to win the Prix Peugeot on his "Aviette," but as the Nieuport firm in rebuilding the machine had in mind the previous accident and made the later edition far too heavy, the inventor failed in his attempt. As in France it is necessary to be successful if one is to commit illegalities with impunity, M. Poulain has now been summoned to appear in court on a charge of riding his machine to the public danger in a park.—J. S

A M. Baligant has entered an aviette of his own design for the Prix Peugeot. It is pedal driven with a large body and a tractor airscrew.

A MEMORY OF M. GARROS.

On Oct. 4th, Fréjus, Saint Raphael, and Nice held ceremonies in memory of M. Roland Garros, the anniversary of whose death in action it was. He had been educated principally in the Lycée at Nice. A wreath was laid by the Nieuport Company at the foot of the statue of Garros in Fréjus. At Saint Raphael the Aero Club de Nice placed a wreath on the statue which marks the point of departure of Garros' cross-Mediterranean flight. At both these places the school children took part in the ceremonies.

THE DEDICATION OF A CHAPEL TO AVIATORS.

A chapel dedicated to aviators, and to be called "Notre Dame de l'Air," was consecrated on Oct. 6th at Val d'Or, near Paris, by the Bishop of Versailles.

M. de Chardonnais represented the Aero Club de France at the ceremony.

GERMANY.

A FLIGHT IN THE "BODENSEE."

Mrs. George Renwick recently made a flight in the Zeppelin "Bodensee" from Berlin to Friedrichshafen. The following extracts from her account of the flight are taken from the "Daily Chronicle" of Oct. 10th :—

"Mrs. Renwick reached the Staaken aerodrome at 8.30 a.m. in a motor-car. The journey took about 40 minutes from Unter den Linden

"Each of the 24 passengers is allowed 30 lb. of free luggage and as much over at 2s. per lb. as they care to take. This luggage is drawn up by ropes into the hold amid-ships. The passengers have to climb up a step-ladder, set against the cabin under the fore-part of the airship, and on entering the cabin find themselves in a car similar to a Pullman but of greater width. There are mica windows, armchairs upholstered in velvet, and red wicker basket chairs.

"When Mrs. Renwick reached the shed, a motley crowd of some 50 men and boys were hanging on to the ropes of the airship, which was held down by these ropes and could be manœuvred about very easily.

"At 9 o'clock the 'Bodensee' was backed out into the open. After some whistling a figure in a sort of naval uniform waved his arms, and shouted 'Hoch,' which, in that case, meant 'Let go.' The airship rose slowly and got under weigh; the forward motion could hardly be felt, although the flying speed was 70 or 80 miles an hour. At 10.30 a.m. they arrived over Leipzig.

"Lunch was served on the journey and consisted of various savouries and cold meats at from 12s. to 15s. per head. Rhine wine and champagne were to be had to drink. Altogether, the luncheon cost rather more than two guineas

"The journey takes place over lovely country, which, from the land, looks very much like parts of the Sussex Downs and Devon.

"Lake Constance was reached in seven hours at an average speed of 65 miles an hour. Another motley crowd pulled the

A View of the Passenger Cabin of the new Zeppelin Commercial Airship "Bodensee," which has recently been touring Northern Germany and Scandinavia. The ship was built at the Zeppelin Works at Friedrichshafen for the Hamburg-Amerika Steamship Company, which thus becomes the first steamship line in the world to own an airship. As usual, Germany sets the example of enterprise to British commercial firms, for, so far, no British steamship firm has acquired an airship, and only one or two have had the foresight to investigate the possibilities of aircraft of any kind.

airship down by its ropes on arrival, and the figure in naval uniform took visible and very audible command. The 'Bodensee' was then lightly manœuvred into a vast shed until the time came for the return voyage to be made."

THE "BODENSEE SERVICE.

The Italian correspondent of THE AEROPLANE writes :—

The Zurich papers announce that a wireless telephone station is now working at Nuremberg, and has given interesting results, keeping in communication with the passenger airship "Bodensee," which carries on a regular service between Friedrichshafen and Berlin, and vice versa, for a distance of 140 kilometres. This is surely the first one has heard of German progress in this direction.

A new airship in construction by the Zeppelin works is to improve the present time taken on this trip to four hours each way, very convenient for Swiss business men.—T. S. H.

THE AIR SERVICE TO SWEDEN.

"Bodensee 2," the first airship belonging to the German Luftreederie, arrived at Stockholm from Berlin on Oct. 9th, with 16 passengers. The machine returned on the same day with a further party of people.

HOLLAND.

THE HAGUE AVIATION GROUND.

The Rotterdam correspondent of the "Times" stated in their issue of Oct. 9th that many applications have been received from Germany to arrange the aviation ground which is to be established at The Hague. British firms ought not to neglect the opportunity to compete.

MEMORIES OF E.L.T.A.

Some notes by Mr. Kenworthy appeared under the above heading last week. One inadvertently omitted to state that the whole of the work done by the Blackburn "Kangaroos" was carried out under the control of the North Sea Aerial Navigation Co., Ltd., a company which is in close relation to the Blackburn Aeroplane and Motor Co., Ltd. The arrangements were organised by Major Veal, who has for some time been manager of the former company.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

A TRANSATLANTIC FLIGHT.

One hears tales of a shortly-to-be-attempted crossing of the South Atlantic from Dakar to Brazil by aeroplane. Olivero, who was attached to the Baracca Squadron, is said to be organising the flight.

A FLIGHT TO POLAND.

Poland is receiving many visits from Italian flying men on business bound. A few days back the Ansaldo Co.'s Ing. Brezzi was flown to Warsaw on a "300," piloted by Stoppani, taking four hours and 40 minutes to reach that capital from Turin. Lieut. Mainardi escorted the "300" on a Balilla. The return trip is planned *via* Posen, Berlin, Prague, and Vienna.

AN IMPORTANT DINNER.

The Aero Club of Italy, backed up by the Association of Aviators and Aeronauts, who are very much alive at their headquarters in the Galleria Nazionale at Turin, were to feast several of the directors of the Fiat and Ansaldo flying-machine departments, also the pilots, Brack-Papa and Stoppani, on 10th inst. Decorations were to be conferred. Decisions as to the line of action of the Italian trade at the Brussels Conference were likely to be arrived at during the evening.—T. S. H.

JAPAN.

H.I.M. the Emperor of Japan has presented 500,000 yen (£50,000) to the Imperial Aero Club for the purpose of civilian aviation, and a like amount has been raised by the Club. An American, who requested that his name might be kept confidential, has also given 180,000 yen for the training of Japanese aviators.

The officers of the Club are as follows : Honorary President, Prince Kuni; President, Count Okuna; first Vice-President, Baron Sakatani; second Vice-President, General Nagaoki.

An aerial mail service between Tokio and Osaka, a distance of 300 miles, will be operated under the supervision of the Club.

There is a great interest in aeronautics among the Japanese, but the difficulty in obtaining machines is proving a handicap.

SWEDEN.

A GERMAN SEAPLANE SERVICE.

The Svensk Lufttransport Bolaget, which possesses a German Sablatnig seaplane, which is in the harbour at Barkarby, are advertising passenger flights and goods transport from Stockholm to Finland. Their machine flew over the city on Oct. 2nd dropping bills to that effect. A Swedish gentlemen interested in the concern is on his way to England to purchase a few English machines with which to carry out this service

PROMISE AND PERFORMANCE.

The German, Lieut. Ebner, who has a machine at Gothenburg which is owned by Direktor Rammf, started out to fly to Malmo on Oct. 2nd, but was forced to land on the way. Everyone is getting very sick of Mr. Ebner, as he never succeeds in getting anywhere and seldom starts at all.

WOULD-BE AGENTS.

A representative of a British aviation firm has recently left Sweden. Several more or less bankrupt flying companies tried to persuade him to make them the firm's agents.

The Nordioka Aviatik Bologet has two machines fitted with 90 h.p. Mercédès engines in a shed on the Barkarby Aerodrome. They have not been flown for over a year, and look to be only fit for "reduction to produce."

SWITZERLAND.

The Italian correspondent of THE AEROPLANE writes :—

FLYING-BOAT ACTIVITY.

Flying-boat stations at Lugano and at Locarno, in the Swiss waters of the Lakes Lugano and Maggiore, are now in working order. At the former station the Swiss pilot, Taddeoli, who was for a long time working for the Italian S.I.A.I. firm, is giving exhibitions and organising flights with passengers.

Switzerland, with only about 100 pilots, and many of them abroad, ought to be a good place for hydro-aeroplane joy-rides, the country being mostly water and mountains.

FLYING PERMIT DIFFICULTIES.

From Lausanne on Lake Geneva some noise has been made over the appointment of (Capt.) Eric Bradley as manager of that flying school. The Swiss Military Authorities seem to have been unable to grant him a flying permit without recognising him as an officer of a foreign Power.

Some fear of establishing a precedent which would mean an influx of German and Italian ex-military pilots into Switzerland appears to have been behind it all.

AERIAL POSTAGE STAMPS.

A special 50-centime stamp is now issued to frank letters on the Zurich-Berne-Lausanne-Geneva aeroplane service.—T. S. H.

UNITED STATES OF AMERICA.

THE AERIAL MAIL SERVICES.

The Washington-New York air mail service obtained 100 per cent. efficiency for the month of August. Although many bad storms were encountered during the month, every machine made its scheduled flight each day.

Twenty-six flights were made each way. An average of 350 lb. of mail was carried on each flight, or a total of 18,200 lb. for the month.

The average speed made was 90 m.p.h., and the average flying time between the two cities was 2 hr. 25 min.

The fastest flight was made Aug. 13th, when Pilot Merrill K. Riddick carried 342 lb. of mail from New York to Washington in 1 hr. 55 min., at an average speed of more than 113 m.p.h.

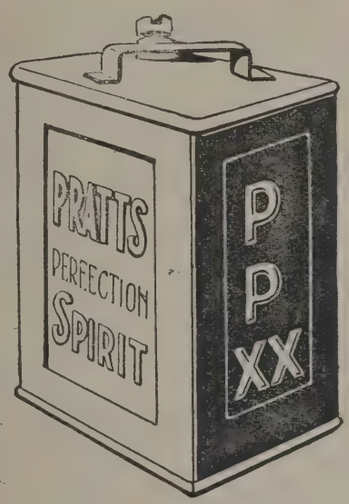
Mr. Otto Praeger, the Second Assistant Postmaster-General, recently sailed from New York to Cuba. During his visit he hoped to make the preliminary arrangements for a flying-boat mail service between Florida and the West Indies.

The Cuban Government is anxious to see the aerial mail communication started. Mr. Praeger is considering proposals from several private enterprises which are now operating between Key West and Havana.

While at New York Mr. Praeger visited the plant of the L.W.F. Engineering Co., where a number of mail aeroplanes are being built to carry 3,000 lb. of cargo for the New York-Chicago service.

The Post Office Department are adopting a synthetic fuel and developing a fire extinguishing liquid which can be injected into the tank in case of fire. Tests have proved that industrial alcohol can be obtained for the same price as high grade petrol, and that it will prove to be 20 per cent. more efficient.

[One takes leave to doubt the chemistry of this statement. —Ed.]



Mr. Praeger said that within the next few weeks they expected to fly the mail between Cleveland and New York without making an emergency stop at Bellefonte, Pa.

Fourteen big cargo aeroplanes are under construction in New York, Cleveland, and Ithaca, and are expected to be in the service early this winter. The L.W.F. mail machine will have sleeping quarters for the crew of three men, besides the 3,000 lb. of letter mail. The other machines are being built by the Glenn L. Martin Co. and Thomas-Morse. They will be slightly smaller than the L.W.F. aeroplanes.

With these machines in operation it is said that the Post Office Department will save one and a half million dollars a year over the present cost of first-class mail transportation.

London-Paris Air Express

Summary of First Seven Weeks' Flying.

August 25th, 1919, to October 11th, 1919.

Flights Scheduled	102
Flights accomplished	99
Prevented by weather	1
Interrupted by weather	1
Interrupted by mechanical defect	1
Number of Miles flown	24,750

The following is an official summary of the weather flown through during these seven weeks.

Days favourable for flying	11
„ unfavourable for flying	21
„ noted officially as "unfit" for flying	10

The attention of Bankers, Merchants, and firms which have houses both in London and Paris is again drawn to the unique facilities afforded by this service, which permits urgent documents, express goods, or passengers to be transported the 250 miles between London and Paris in an average time of 2¼ hours. The service, which has been operating daily since August 25th, has been started in order to demonstrate that, with the use of skilled pilots and fast machines, such an express air service can now be run with sufficient reliability to afford a definite, daily convenience to the business world.

THE AUSTRALIAN FLIGHT.

On Wednesday, October 15th, Capt. George Campbell Matthews, Aust. F.C., and Sergt. Tom Kay, Aust. F.C., both Australians, hope to leave Hounslow, weather permitting, for Australia. The flight will be made in accordance with the rules of the Australian Government's competition.

The machine is a Sopwith "Wallaby" fitted with a Rolls-Royce "Eagle VIII" 375-h.p. engine. This machine has a maximum speed of 121 m.p.h., a cruising speed of 107 m.p.h. at 5,000 ft., and a cruising range of 1,500 miles. No wireless is fitted as this was not considered a necessity.

Captain Matthews, who is thirty-six years of age, has spent twelve years at sea in the mercantile marine as a practical navigator, and holds an extra-master's certificate.

On the outbreak of war he was acting as chief officer of a passenger steamer off the Australian coast, but he at once left and joined the Australian Light Horse as a trooper. He received his commission in Gallipoli, and subsequently served 2½ years with that force at the Dardanelles and also in Egypt. He joined the R.F.C., and took his pilot's certificate in February, 1917, afterwards proceeding out to France with the 1st Australian Scout Squadron, No. 68, in September. After three months in France he returned to England and was promoted to Flight Commander in No. 4 Australian Scout Squadron, which was then flying Sopwith "Camels." When the Australian Training Wing was formed in England Captain Matthews went to it as Wing Examiner.

He has flown some twenty-one different types of machines, his long maritime experience having proved of the greatest value to him in the air. It is interesting to note that he expects to navigate his aeroplane on this long voyage exactly as though it were a ship. For this purpose he has had his own navigation instruments made for him by Hughes, and is employing his own methods of compass correction. Captain Matthews has an intimate knowledge of the Malay Archipelago, the Celebes Island, and other islands of the Pacific.

Sergeant Kay, Aust. F.C., who is accompanying Capt. Matthews, is not himself a qualified pilot, but whilst waiting to start Capt. Matthews has trained him in the management of the Sopwith "Wallaby," so that he can act as a relief pilot.

The route which Capt. Matthews and Sergeant Kay are to take is roughly as follows:—

Over France, Italy, Greece, then across the Mediterranean to Egypt; through Mesopotamia, along the north coast of the Persian Gulf to Karachi; then across India to Calcutta; down the Malay Peninsula, landing at Rangoon and Singapore, and on to Batavia; then along the Dutch East Indian Islands to Timor, and finally to Port Darwin, which is one of the most northerly coast towns in Australia. The distance totals about 12,000 miles. The longest sea passages are the 300 miles across the Mediterranean and the 400 miles from Timor to Australia.

Under favourable conditions, Captain Matthews hopes to average about 90 miles an hour whilst in the air, but he will not fly more than about five hours per day.

The Air Ministry have given all possible facilities in connection with their establishments on the route to India, and beyond that point dumps of fuel have been established at 500-miles intervals by the Shell Marketing Co., and the Wakefield Oil Co.

According to the terms of the Australian Government £10,000 Prize, the maximum time allowed is 30 days, but, as Captain Matthews points out, he is, as a member of the Larkin-Sopwith Company of Australia, far more interested in demonstrating the utility of the single-engined aeroplane for long distance flights of this character than in winning the cash prize, although he will do his best to win it.

Captain Matthews and Serjeant Kay.

A GERMAN FATHER'S REQUEST.

The following letter has been received:—

Sir,—I appeal to the chivalrous feeling of the British Royal Flying Corps, or of other persons in putting forward the following request:—

If any readers of THE AEROPLANE should be able to give me some information regarding the fate or the whereabouts of my son and only child, as up to now I cannot obtain any news or hear anything about him.

My son, Albert Hets, born on March 5th, 1896, at Hamburg, Lieutenant of the Reserve, belonging to the German Air Squadron 37, is missing. He participated in an air-fight on Sunday, Aug. 11th, 1918, about midday near Chaulnes (west of the Somme, France), between the German Air Squadron 34 and 10 English De Havilland two-seaters, and it is supposed that he came down behind the English lines.

It is very likely that he has been wounded or killed in or after this action, or became prisoner of war, and with the possibility that he may have lost his mind.

My son was flying on a one-seater Fokker marked by a red ring round the black body and by a black and white striped tail. The number of his Fokker was 712/18 Fokker D.VII. The number of the motor was 41,960. The number of the machine-guns were 7,381 and 6,341.

I shall feel very grateful to receive any information whatever about my son.

(Signed) ALBERT HETS.

Holtystrasse, 14 (Uhlenhorst), Hamburg (Germany).

A FORTHCOMING DINNER.

The dinner for officers of D Squadron, No. 2 Wing, R.N.A.S., which was postponed owing to the strike, will be held at the Restaurant Frascati on Friday, Oct. 24th. For further particulars please apply to Captain J. A. Yonge, D.F.C., The Eastbourne Aviation Co., Eastbourne.

THE CASE OF MISS DOUGLAS-PENNANT.

The committee appointed by the House of Lords to inquire into the dismissal of Miss Douglas-Pennant from the command of the W.R.A.F. met on Oct. 14th at the House of Lords. Sir Edward Carson, K.C., has given up his brief for Miss Douglas-Pennant owing to his political engagements. Mr. J. A. Hawke, K.C., will now lead for her, with Mr. Stuart Bevan, K.C., and Mr. Buchanan.

Administrative Branch.—Sec. Lt. H. Clarke to be Lt., June 19th, 1918.

The following relinquish their commns. on ceasing to be empld.:—Lt. O. Dunkerley (Paymr. Sub-Lt., R.N.), Sept. 29th, 1918; Lt. J. A. V. Duff (Lt., Rif. Brig.), May 20th; Lt.-Col. J. W. L. Hunt (Lt.-Comdr., R.N.), Sept. 5th.

To All Users of Motor Spirit

There are adequate stocks of Motor Spirit in the country to meet ALL requirements.

In the absence of railway transport the difficulty is to get the motor spirit into the hands of those that need it for food distribution and other essential national needs.

The Distributing Companies are confident that this can be done with the co-operation of the public and the trade.

The distribution by motor spirit transport to garages, etc., must be discontinued, all such motor transport being required for the purposes already indicated.

Dealers and commercial consumers requiring motor spirit must therefore call at the local depots of the Distributing Companies and bring with them all empty packages available, as supplies of full packages will be limited to the number of empties returned.

The hoarding of motor spirit, or the use of it by those who do not really require it during the railway strike, is contrary to the public interest.

The Distributing Companies much regret the inconvenience caused, which they hope will not be of long duration.

WAKEFIELD

Castrol R

The Cosmos Engineering Co., Ltd.—builders of the 14-cylinder, 315 h.p. "Mercury" engine—exclusively use and recommend Castrol "R" for lubrication of the above engine and also with their 450 h.p. "Jupiter."

Lubricated with Castrol "R" a "Mercury" engine fitted to a Bristol Scout, achieved the best climbs in the official tests—10,000 feet in 5 mins. 25 secs.; 20,000 feet in 16 mins. 15 secs. These figures, checked by official barograph records, constitute British records.

C. C. WAKEFIELD & Co., Ltd.
Wakefield House, Cheapside,
London, E.C. 2.

The WHEELER Pocket Height and Weather Indicator

For Aerial Passengers.

THIS instrument is designed for use of aviators. It indicates the exact height at which the Aeroplane is flying and is of great interest and value to all who fly. Furthermore it has the additional advantage of indicating the weather for general use—it is, in fact, a pocket barometer. The instrument is made in watch form, gilt or oxydized case, and supplied in solid leather outer case in a secure and convenient form for the coat pocket.

Two sizes: Diameter 1¾" Diameter 2½" **Aircraft and motor accessory firms are invited to apply for terms** *Can be supplied with luminous dials if desired*

T. WHEELER

BRICO
TRADE MARK
PISTON RINGS

During the war The British Piston Ring Co., Ltd., conducted many important experiments for the Air Board and were responsible for setting the standard 2 K6 Specification for iron for Aircraft Piston Rings.

BRICO Piston Rings are made of 2 K6 iron and are finished to dead accurate dimensions. These rings represent the highest achievement in manufacturing to-day.

If the best Piston Rings must be used, there is nothing to equal BRICO Piston Rings in performance, as our Aircraft Rings are specially made for their work.

BRICO Piston Rings are made for all Aircraft, Motor Car and Motor Cycle Engines. A very wide range of stock sizes makes it possible to select almost any size you need.

C.B. (Military Division).

Group Capt. P. R. C. Groves, C.M.G., D.S.O., R.A.F.
Wing Comdr. A. J. L. Scott, M.C., A.F.C., R.A.F.

The King has been pleased to give directions for the following appointments to the Most Distinguished Order of Saint Michael and Saint George in recognition of distinguished services rendered during the War:—

C.M.G.

Group Capt. R. H. Clark-Hall, D.S.O., R.A.F.; Maj. (actg. Lt.-Col.) R. D. Waterhouse, R.A.F.

The King has been pleased to give orders for the following promotions in and appointments to the Most Excellent Order of the British Empire in recognition of distinguished services rendered during the war:—

C.B.E. (Military Division).

R.A.F.—Wing. Comdr. (A./Air Commodore) F. G. Willock, D.S.O.; Chaplain-in-Chief Rev. H. D. L. Viener, M.A.; Wing Comdr. (A./Group Capt.) A. D. Cunningham, O.B.E.; Hon. Col. L. Munro, O.B.E. (Col., Retd. List, Hants R.); Wing Comdr. W. D. Beatty, O.B.E., A.F.C.

Squdn. Leader (A./Wing Comdr.) J. L. Birley, O.B.E.; Wing Comdr. F. L. M. Boothby; Wing Comdr. I. T. Courtney, O.B.E; Wing Comdr. E. H. Griffith, O.B.E.; Wing Comdr. J. Mead, M.C.; Wing Comdr. H. W. S. Outram; Wing Comdr. R. C. M. Pink; Wing. Comdr. F. H. G. Playfair; Wing Comdr. H. L. Woodcock; Lt.-Col. W. E. S. Burch (R. Ir. Regt.); Maj. (Hon. Lt.-Col.) A. H. Cheatle, O.B.E.; Lt.-Col. G. Dreyer, O.B.E.; Lt.-Col. E. R. Peal, O.B.E., D.S.C.; Lt.-Col. A. E. J. Reiss, O.B.E.; Dr. Miss J. L. D. Fairfield, M.D.; Maj. A. H. Hogarth, O.B.E., D.C.M.

(To be continued.)

U.S.A., 1 Year, $8 50c.

ON BLAZING THE TRAIL.

Though at the moment, considering all the difficulties under which the Aircraft Industry is labouring, the progress of Civil Aerial Transport may be regarded as moderately satisfactory, it cannot be said that this country is doing all that it might do to obtain a command of the air in the realm of Commercial Aeronautics analogous to that which is held on the sea by our Mercantile Marine. The following notes are therefore published in the hope that they may provide food for thought by the Aircraft Industry, by such members of the British Public as have the intelligence to take an interest in aeronautical affairs, and by the Department of Civil Aviation—about whose generous contributions to the traditional Great Pavement of Hell we have heard so much.

Some time ago certain R.A.F. flying-boats made a tour of the Baltic Sea, presumably with the intention of impressing on the numerous indeterminate, though nominally self-determining, Slav tribes which were lately the subjects of His Imperial Majesty the Tsar the might of British Air Power. At any rate that would appear to have been their proper function. In the course of their journey these boats visited certain friendly nations which were benevolently neutral in the recent brief war which has somewhat discommoded part of Europe and has afforded the United States an excuse for becoming a military Power of importance.

One of the countries visited was the Kingdom of Sweden, and in consequence the Information Department of the Air Ministry, so ably conducted by Major-General Swinton, issued a graphic account of the way in which one of these boats had impressed on the inhabitants of Stockholm the superlative excellencies of British hydro-aeroplanes. Naturally those concerned with the Aircraft Industry were elated at the good work thus done by a Government Department in aid of British trade, and began to think that after all the Department of Civil Aviation was justified in its claim that it was "blazing the trail" for the Industry.

One does not for a moment doubt the accuracy of the "news story"—to use a Fleet Street *cliché*—as issued by the Air Ministry from information received, but it would seem that some of the inhabitants of Stockholm failed to avail themselves of the opportunity so kindly provide by the R.A.F. of seeing Britain's best and latest method of transport. The following letter will explain itself, and perhaps the Information Department of the Air Ministry will vouchsafe an explanation of the discrepancies between its communiqué of September 2nd and the affairs hereafter related:—

The Swedish Aspect.

Sir,—With reference to the issue of THE AEROPLANE dated Sept. 10th—On page 971 particulars of the visit of the F.5 boat here are given. The boat arrived here in the evening of the 3rd ulto., and, avoiding flying over any part of the city, landed in the large lake outside Stockholm. I was unable to ascertain whereabouts in the harbour it was to be moored, and although we flew round on an Avro we were unable to find it.

The following day the boat left for Gothenburg without having made any demonstration flight or doing passenger-carrying at all. Certainly nobody in Stockholm saw the boat either in the air or on the water, except representatives of the British Legation who went down in a motor-boat to see it, and it is difficult to see how any impression, good or bad, was created in this capital.

With several German flying boats and seaplanes continually flying about the city, and owned by Swedish individuals or newly-formed air-traffic companies, it is easily seen that any business created by the need of Swedish merchants is going to Germany. Once German machines are utilised in any numbers it will become practically impossible for any British aviation concern to sell any machines. It is a thousand pities the F.5 boat did no propaganda work here, as the Press is quick to attribute anything of this kind to unsuitability of the machine.

A Point for the S.B.A.C.

I do not think English aeroplane manufacturers quite appreciate the development of aviation in Sweden. There is an air traffic company now organising which has a capital of over three million kroner, and is sending its representatives to different countries to inquire about machines and to place orders. Swedish people have seen nothing but German type machines up to now, and having regard to the accessibility of Germany compared with England, the English firms are handicapped at the start.

A wealthy Swede has just presented the Flying Corps here with two modern German land machines, one scout and a two-seater, and these were expected here to-day at our aerodrome, where they will be thoroughly demonstrated to the city before being handed over. But do you think a British firm would dream of sending a machine over? Not a hope!

The Air Traffic Company by whom I am at present employed are shortly placing orders for land machines and seaplanes, and naturally I am pushing the advantages of British machines all I know. But unless the British companies can go ahead with some advertising and offer reasonable prices and quick deliveries I fear my efforts will be unavailing.

A week or so ago I received replies to my inquiries for a small single-seater to demonstrate and exhibit, as our Avros and D.H.6s are otherwise employed, and the best offer I got was an 80 Le Rhone Scout for £500, second-hand. The cost of transit would be half as much again!

Last night I attended a lecture by invitation of the Aeronautiska Sällskapet given by two German doctors on the medical aspects of aviation. The lecture was illustrated by lantern slides and much apparatus was used to demonstrate various tests, the members of the audience being invited to undergo each.

Swedish manufacturers are alive to the possibilities of aerial advertisement of their goods. Last week I was paid 1,500 krs. (about £88) to take a bag of coffee and some leaflets from Gelfe to Falun, a distance of about 40 miles, where I happened to be going to give an exhibition.

An aeroplane purchased by the Government from Germany on its arrival at the south of Sweden was inspected on landing by representatives of the Flying Corps and on account of its age and condition was not accepted.

At the Thulin flying school passenger flights may be had for 30 or 40 krs., and the newspapers ask why we charge 100 or 150 for flights with our Avros. Our reply is that we are a paying concern, whereas Messrs. Thulin can hardly be said to be unduly rushed with aircraft business, moreover, our pilots and machines are still "serviceable"

What Did Happen?

It will be remembered that, according to the aforesaid communiqué the boat flew over Stockholm and took up sundry passengers. The writer of the letter is a British pilot now working with the "P. O. Flygkompani" in

Sweden, so one naturally assumes that he would be more interested in the arrival of a British machine than would the non-flying inhabitants of Stockholm, and so would be more likely to see it in the air and to find its mooring place when at rest.

Just why representatives of the British Legation should themselves trouble to go and see it is not very clear, except that presumably they were gratifying a little mild personal curiosity. But the action proper to the British Legation under the circumstances is very clear indeed. The Commercial Attaché at the Legation, if such a mere person is tolerated in that august establishment, should have given a banquet, or at least a lunch, in honour of the crew of the F-boat, and should have bidden to the feast the leading business men of Stockholm, after which the guests should have been taken in motor-boats to see the flying-boat, and should have been offered passenger flights therein.

If our Legation at Stockholm is actually interested in serving British interests in Sweden, the Minister himself should have presided at such an entertainment, and the Naval and Military Attachés should have invited the Swedish Naval and Military chiefs, or at any rate the chiefs of the Swedish Flying Service, to view and test the British craft. So far as one can gather, nothing of the sort was done, and so a very fine opportunity seems to have been lost of impressing the Air Power of the British Empire and the excellence of British aircraft on a people whose country is by nature peculiarly suited to the uses of seaplanes, and especially of flying-boats of the larger kinds.

Germany's Enterprise.

It will be seen that the writer of the letter refers to the continual flying of German hydro-aeroplanes about the city of Stockholm. Also it will be remembered that for months past—in fact since a time before the war was finished—this paper, thanks largely to the excellent information sent by its Scandinavian correspondent, Mr. Erik Hildesheim, himself a pilot trained at the Thulin school in Sweden, has constantly drawn attention to the efforts made by the German Aircraft Industry to capture Swedish business. So the Department of Civil Aviation and the British Aircraft Industry cannot complain that they have not had fair warning of what to expect.

Yet, as this letter shows, nothing active has been done to impress on Scandinavia in general and on Sweden in particular the multifold virtues of British aircraft. As has been said, Sweden offers a magnificent market for hydro-aeroplanes of all sorts, and the value of this market has been materially increased during the past week or so by the formal cession of the Aaland Islands to Sweden.

A Strategic Stronghold.

These islands form a continuous chain across the Gulf of Bothnia between Sweden and Finland, and there is between the islands ideal water for seaplanes. The people are typical Scandinavians, hard-working and intelligent in spite of a hundred years of Slav misrule.

They are worth cultivating not only from a business point of view, but for military reasons, for in the Great War against the Slavs they will be the North-Eastern outpost of Teutonic civilisation against the yellow men. And, because—unless all one's hopes and labours come to nought—British Air Power in the Great War will play even a greater part than British Sea Power played in this recent affair, it will be well that the people of this outpost of our civilisation shall be made familiar with British aircraft and with British aviators.

That perhaps is looking too far ahead, and such considerations can hardly be expected to weigh with our politicians or with our business men. But the commercial possibilities of Sweden and the Aaland Archipelago should certainly appeal to our cupidity, if to no higher quality.

Self-Help and Self-Preservation.

It is becoming more and more evident that the Department of Civil Aviation is without value to the Aircraft Industry, and is in fact—as will be seen later in these notes—doing positive harm, in its stupid attempts to advertise itself, by failing to perform journeys which to a mere commercial air-line would be all in the day's work. Which is quite apart from the harm it is doing by holding up progress at home by the actions or inactions of its incompetent inspectors and licensing officials.

Therefore it is evident that the Aircraft Industry must proceed to help itself. And if it is to help itself it must do so far more effectually than any British Industry has done in the past. One recognises that rival manufacturers would cheerfully cut one another's throats in the sacred cause of commerce, but this is a case of all hanging together lest they should hang separately.

Wanted: Genuine Propaganda.

With our usual lack of political foresight we—instigating our Allies—have prohibited Germany from making aeroplanes of war. Which means that the German Aircraft Industry is forced at once to turn all its designing genius onto the production of commercial aeroplanes, instead of sitting up on end begging for Government orders and doing nothing while the orders are not coming. Consequently, the German being about the best business man in the world, and his workpeople being already at work like niggers to capture the world's trade—despite the astounding nonsense poured forth by Sir Auckland Geddes a week or two ago—Germany is, as this letter from Stockholm shows, already in a fair way to capture the Swedish trade in aircraft.

The only sane course for the British Aircraft Industry to take is for the S.B.A.C. to form a Propagandist Department of its own, and to form a regular squadron of demonstration aircraft, to which each live aircraft firm will contribute a unit. This S.B.A.C. squadron will then tour the world and demonstrate beyond argument to all foreign countries that British aircraft, whether for war or commerce, are incomparably the best. If the S.B.A.C. has the pluck and the common sense to combine in such a scheme it can, inside twelve months, sweep all competitors from its path.

Serving Two Masters.

There is the highest possible authority for the maxim that no man can serve two masters. Therefore it should be obvious that the units of the Royal Air Force cannot serve at one and the same time the Military (including the Naval) branch of the Air Ministry and the Civil Aviation Department. So far as the attempt has been made it has been an abject failure.

It would be well if the Air Council would realise that an R.A.F. unit must be either a purely military force, and must be used and stationed as such, or that it must be a purely civilian affair, in which Service ranks and customs are abolished and the whole thing runs entirely as a civil service—like the Post Office. It would be better still if the Air Council would make up its mind to cut loose its connection with civil aviation and let the Aircraft Industry work out its own salvation. For at present it is doing far more harm than good, and one can see no reason why its methods or its effects should ever change for the better.

Official Parasites.

It is not that one has any objection to a number of officials—deserving or otherwise—holding jobs under the Civil Aviation Department. Officials of some kind

must exist to inspect and license aircraft. It is their clumsy methods which are so objectionable.

There is a story of an Irish servant who, complaining of a plague of fleas left in her room by an unclean predecessor, remarked :—"It isn't the little bit they'd eat that I'd begrudge them, but their constant tramplin' has me annoyed."

Similarly it is not their little salaries that one would begrudge the officials who profess to control Civil Aviation; it is their constant trampling about in wrong directions and with wrong methods which disturbs the progress of Commercial Aeronautics. One has already given an example, or alternatively has asked for an explanation, of official methods in Northern Europe. Let us now consider another case in the South.

Blazing the Trail.

Here then is a letter from one of the most skilful pilots and most experienced aerial navigators in this country concerning the much-boomed route from England to Egypt—which latter country has been prematurely labelled "the Clapham Junction of the World's Air Traffic."

Just why any civilian should want to go to Egypt when on the way to either India or the Cape passes comprehension, seeing that by far the best way to India is *via* Germany, Hungary, and Turkey, and the best way to the Cape is down the West Coast of Africa by seaplane. There is good military reason for making Egypt an important centre of Service aviation, but none for making it important from a civil aviation point of view, except as a holiday resort. Which merely illustrates the folly of mixing up the two sides of aeronautics.

Be that as it may, the Air Ministry decided to "blaze the trail" to India and the Cape *via* Egypt. And this is how it is done, according to the letter before mentioned :—

The Route to Cairo.

The Air Force expenditure has been a subject of considerable comment during 1919, and at a time when unnecessary expenditure of all sorts should have been curtailed there has been a particularly flagrant instance of disregard of economy by the Air Ministry. It is one of the most pitiful scandals of its kind, involving enormous expenditure, colossal waste, and severe loss of life, and has been going on unchecked and hitherto unnoticed during the past few months.

The origin of the scheme to move three squadrons of Handley Page machines to Egypt is traceable to the decision to make Egypt a world's air traffic junction. The scheme itself seems sound, but its inception hopelessly premature. The attempt to put it into being under existing conditions is merely consistent with the incompetence which has reigned in high places in the Air Ministry since its birth.

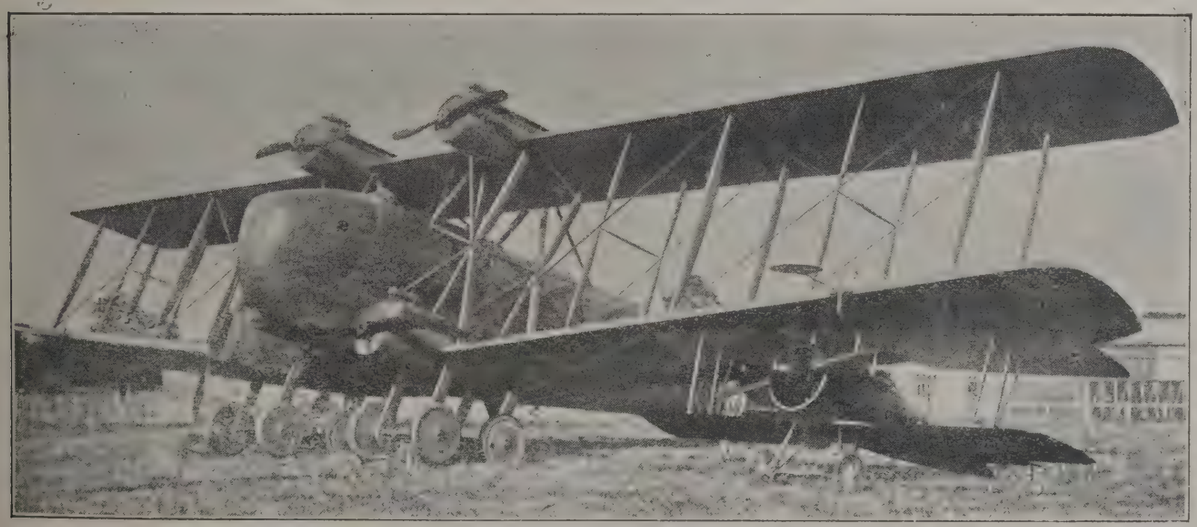
It is necessary in the first place, therefore, to condemn the decision to send machines to Egypt. It illustrates the utter lack of full understanding by highly-placed officials of the conditions of the flight and of their lack of sympathy in the difficulties and dangers of such a route.

The most disgraceful part of the whole matter is that the machines themselves were in a totally unfit condition in many cases to undertake the flight. Many of them had been standing out in the open almost since the Armistice—at any rate, for some months. Their condition was nothing less than hopeless, and cases have occurred in which machines have been ordered off at ridiculously short notice, with all rubber connections and perishable parts rotted by the weather. The figures given below of the percentage of unsuccessful flights prove the total unfitness of the machines themselves.

The nature of the route is entirely unsuitable, after Marseilles, for land machines, and in advocating or authorising flights on land machines over 200, 300, or 400 miles across the water the Air Ministry is guilty of total disregard of the first principles of safety and economy.

That there have not been more than two or three machines lost in the sea is merely luck, and I maintain that it should become a set principle—for the present—that journeys over the water on land machines should be limited to fifty-mile crossings at the longest.

It was on my recent tour to Nice that I was first made aware of the state of affairs. Various Handley Pages stranded *en route* gave me a clue. Skeleton fuselages from crashes on aerodromes further enlightened me.



I must here pay a tribute to the loyalty of the officers of the Royal Air Force to the route. I could get nothing out of them whatsoever, great or small, old or young, but that they were carrying on—the usual quiet type, some my own pupils, full of the sense of duty—silently determined and refusing to complain. I gleaned a few personal anecdotes, that was all. I found them working under impossible conditions with perseverence and skill, without assistance.

One heard of one officer and three men going out to a stranded machine stuck on its nose in a ditch, without tackle or mechanical means of assistance, and setting about restoring the machine to its normal condition, a feat that seems almost impossible under such disadvantages. For briefness, I enumerate various points below which I consider should be the subject of an inquiry. No comment is necessary in most cases.

Points for Inquiry.

(1) Machines.—Worn out by weather and exposure, rubber joints perished, pumps giving constant trouble. Machines in this condition ordered out on the most difficult and impossible of routes. Result—a great percentage of forced landings, and continual engine trouble. I am naturally vague on figures, but I am of opinion that the percentage of failures to reach the journey's end is as high as 30 per cent., and I believe that the Air Ministry will find this figure difficult to refute.

After much trouble and inquiry, generally from French in-

The Blériot "Aerobus" (four 300 h.p. Hispano-Suiza engines), which has recently undergone its trials at Buc. This machine is designed to carry 28 passengers. A standard Spad biplane is seen alongside it.

habitants, I believe I have traced ten totally wrecked Handley Pages between Paris and the farthest corner of Italy. Had I had time to journey to Athens myself I might have discovered more. (This colossal waste of about £100,000 would have fully covered the cost of shipping the whole lot intact to Alexandria.) The condition of the machines robbed the pilots of all confidence and made success seem almost impossible.

(2) Ten lives have, I believe, been lost on the route, not including Capt. Darley's death, just recorded on the same route.

(3) Officers and men have been stranded for weeks in Italy without pay, and I understand that but for private means there would have been nothing to support them, or their men. Meanwhile the men have lived on the charity of their pilots.

(4) A complete absence of Handley Page riggers or Rolls-Royce engine fitters was noticed in more than one instance. By riggers and fitters I mean men fully skilled in re-rigging or engine repairs on those types. Such a state of affairs is quite inexcusable and has, without doubt, led to many of the accidents. Such a route should have been particularly well equipped in every way, and the absence of really skilled men at bases is typical of R.A.F. methods.

(5) One pilot was saved from drowning by an Italian, while his fellow pilot drowned, and was sent straight back for another machine. He was found by me, *en route*, stranded with trouble of sorts. His attitude was wonderful, but one could feel what it cost him—a boy of about 23—to retain his nerve.

(6) Absolutely no special preparation was made in the way of anchorage for machines, with the result that three Handley Pages were blown over, to my knowledge. The terrific force of the "mistral" should have been well known to the Air Ministry, and the few miserable picker pins supplied proved hopelessly inadequate. I spent part of a night holding my own machine down, while R.A.F. officers helped to secure their Handley Pages, meditating on the greater comfort of the Ritz or the Carlton as compared with the "mistral," pouring rain, and a field of mud!

(7) Journeys of over 250 miles across the sea on land machines in doubtful conditions seems wickedly dangerous. The route from Istres onwards is unsuited to land machines, and the sooner the Mediterranean mails are taken by seaplane the better.

(8) I noticed that a good deal of the flying was done by officers not permanently commissioned. The dangers of the route were such that I think that only officers intending to make flying their career should have been compelled to undertake them.

(9) A complete absence of higher authority or even of interest was noticed. I could find no trace of superior control or inspection, certainly not in such close contact as should be desirous in dealing with such difficult conditions.

A Public Duty.

In stating these points I feel a certain obligation to the public in that I think that the facts stated by me should be verified. It is naturally impossible by private inspection or private inquiry to obtain full details. If I am wrong in some cases it is because of official information being most naturally withheld. If my facts are in any way approximately true, I consider that the official responsible for the dispatch of the machines in question should be removed from his post.

Alternatively I consider that any decision involving colossal expenditure should be submitted to the Treasury and that the practice of a grant to the Air Force giving discretion in millions is a mistaken policy. *No commercial firm would ever undertake to move machines to Egypt by air under conditions such as have been described.*

If any notice is taken of these statements there may be some useful result.

A General View.

I should like to record my opinion that the route to India is such that the design of engines and machines has not yet reached a pitch which can render the undertaking paying as a commercial enterprise, and I think that this test should regulate any such enterprise undertaken by the Air Ministry in the future, apart from experimental work, and I should like to see the principle adopted that land machines shall not be used for oversea work.

There is an ideal point of exchange from aeroplane to seaplane at Istres, using the Etang de Berre. This is adjacent to Marseilles and is an inland lake of considerable size. International troubles would thus be largely overcome, as our Mediterranean bases would then be used without consulting other Powers.

Unless and until the principle of using seaplanes over the sea is adopted I can foresee nothing but trouble and loss.

I further see that aerial travel is not sufficiently restful to enable passengers to make continuous day and night journeys until improvements are effected, and I think rather that the trip to India may be extended to six days with comfortable rests at nights, combined with sight-seeing and about ten hours' flying in the day. This should make travel by air ideal and, though it would reduce the speed over the distance, would leave the remaining attractions of flying unimpaired.

The Need for Inquiry.

In publishing the foregoing statement one wishes it to be clearly understood that it conveys no reflection on the purely military side of the Air Ministry. That side has been more than well occupied in reorganising the R.A.F. on a peace footing and in cutting down unnecessary expenditure on air stations at home and abroad. One only wishes that it were possible to make public the excellent work which has been done in this respect.

But it certainly does seem that there is reason for a very strict inquiry into the departments which are responsible for this tragic fiasco on the route to Cairo. If this is an example of the official idea of "blazing the trail," one cannot congratulate a department which seems to have succeeded only in marking the route with a series of pylons composed of the pathetically protruding tails of multiple-engined aeroplanes at £10,000 apiece.

Particular notice should be taken of the fact that while the writer of the letter casts no reflections on the machines themselves he is righteously indignant at the condition in which they were dispatched on their perilous journey. And in the kindness of his heart he makes no allusion to the ridicule cast upon British Aviation throughout the Latin world by our lamentable exhibition of seeming incompetence either to build or fly aeroplanes.

The Hendon Scandal.

In this connection one desires to recall the inquiries in this paper, and in the House of Commons, early this year respecting a number of Handley Page machines which were left standing out on the Hendon Aerodrome week after week in the worst of weather. When those awkward questions were made public orders were sent to Hendon to get those machines away at once, and they were distributed to various stations about the country—some of which, one is told, were not only without sheds suitable to house Handley Pages, but were without personnel who knew how to handle big machines.

In some cases the stations to which they were sent refused to take them on charge, and the machines were bandied about from one station to another, left exposed to the weather, damaged by inexperienced handling, and generally deteriorated by ill-treatment. It would be interesting to know how many of those machines which were first damaged by exposure at Hendon (for they were damaged in spite of General Seely's fluent denials) were sent on this jaunt to Egypt.

Will somebody in authority demand the log-books of the ten or more machines which have thus been lost, and make known definitely whether their record was such as to justify their having been selected for such an adventure as an unorganised flight to Egypt.

A Word to the Supply Department.

One is under the impression that an affair of this nature comes within the scope of the Supply Department rather than into the Technical Department's affairs. So perhaps, if an inquiry be instituted, it might be extended to include the state of sundry four-engined machines which are said to have been delivered to the air station at Hawkinge during the past four or five months, and perhaps earlier.

If one is not altogether misinformed there is a scandal of almost equal financial magnitude in this case. No blame attaches to any of the officers or men at Hawkinge, for one is told that while these four-engined machines were being delivered there was no adequate accommodation for them, and that the personnel had no experience in handling or housing big machines. Con-

CIVIL FLYING

WITH

THE SOPWITH "DOVE" 2-SEATER SPORTING MODEL.

COMFORT AND ECONOMY

The Sopwith "DOVE" is a sporting and utility aeroplane, based, in point of design and general arrangement, upon the famous Sopwith "PUP."

With its fast climb, high-speed, quick manœuvrability and wide-speed range it is an ideal safety-first pleasure aircraft.

sequently they were damaged in hauling them about and in folding the wings, and by not chocking-up the wings when folded. Also they had perforce to be left exposed to the weather and so suffered considerably.

It seems very probable that proper inspection of these machines—which have now perhaps been distributed again to other inadequate stations—may disclose the fact that they, like those which were hustled away from Hendon, are unfit to fly. And if they are, in consequence, logged as unfit, some lives and a considerable sum of money may be saved by preventing people from flying them.

The Supply Department has no reason for being proud of its work during the last year of the war, and still less of its work since the Armistice. It has now, at any rate, an opportunity of justifying its existence.

The Evils of Spoon-Feeding.

Taking it all round, therefore, one is convinced that the less the Air Ministry has to do with Civil Aviation the better. And of all its efforts it is particularly desirable that it should give up that particular form of amusement which it is pleased to call "blazing the trail."

We are now beginning to see the mess it has made of the Australian Government's offer of £10,000 for the first Australian to fly to Australia by butting in and in conjunction with the equally futile Committee of the Royal Aero Club making a straight "go as you please" flight into a cut and dried competition, hedged round by rules and regulations, delayed beyond the proper starting time, and saddled with a time-limit which in itself is bound to force competitors to fly when disinclined and so is more than likely to cause loss of life.

One can recall no other activity in which a Government department has endeavoured to do pioneer work. In exploration, in mining, in steamship transport, in the development of railways, in the installation of telephones, and so forth, in fact in all the activities in which this country has led the way, the trail has been blazed by private or commercial enterprise. Only when Government departments have butted in and tried to take control have we fallen behind other nations.

Government control of adult industries has been sufficiently disastrous. How much more is Government spoon-feeding of an infant industry likely to bring disaster? Judging by the examples recorded hereinbefore, it seems rather as if the Air Ministry resembles an inexpert nurse who, instead of conveying the food to the infant's mouth, merely succeeds in jabbing the spoon into the infant's eye and permanently distorting its outlook on the future.—C. G. G.

AN ANCESTOR OF AVIATION.

It must be a cause of some considerable wonder to many of those who have of late years come to consider themselves as amongst the pioneers of aviation when they are brought face to face with the works of some of the really early students of aeronautics. Unfortunately many of those who are to-day amongst the leaders of aeronautical science are apt to ignore the works of those who laid the foundations of that science.

Thus Mr. Leonard Bairstow, C.B.E., D.Sc., F.R.Ae.S., etc., bears a sufficient reputation of this type to have been selected by the Royal Aeronautical Society to deliver the 1919 Wilbur Wright Memorial Lecture.

In that lecture Mr. Bairstow in a preliminary historical survey of his field credits Sir Hiram Maxim with producing a steam plant weighing half a pound per horse-power, whereas the true figure was 5 lbs. per h.p. He then proceeds to state that the Langley full-size monoplane was wrecked at its launch, probably because it lacked stability, and that it was later flown by Mr. Glenn Curtiss after the original steam plant had been replaced by a modern aero-engine.

In actual fact the Langley monoplane was wrecked on two occasions by fouling its launching gear, and on its flight over Lake Keuka, piloted by Mr. Curtiss, eleven years later, its stability was entirely satisfactory, and the power plant used was that designed for it by Mr. Manley in 1903, and consisted of a 5-cylinder air-cooled radial petrol engine of the type which our enlightened Technical officials are now claiming to have done so much to develop.

With this as an indication of the extent and accuracy of the acquaintance of our leading aeronautical authorities with the history of the achieved facts of past days, there can be no grounds for surprise that the name of Mr. Horatio Phillips should only survive in one, and that a misapplied, case.

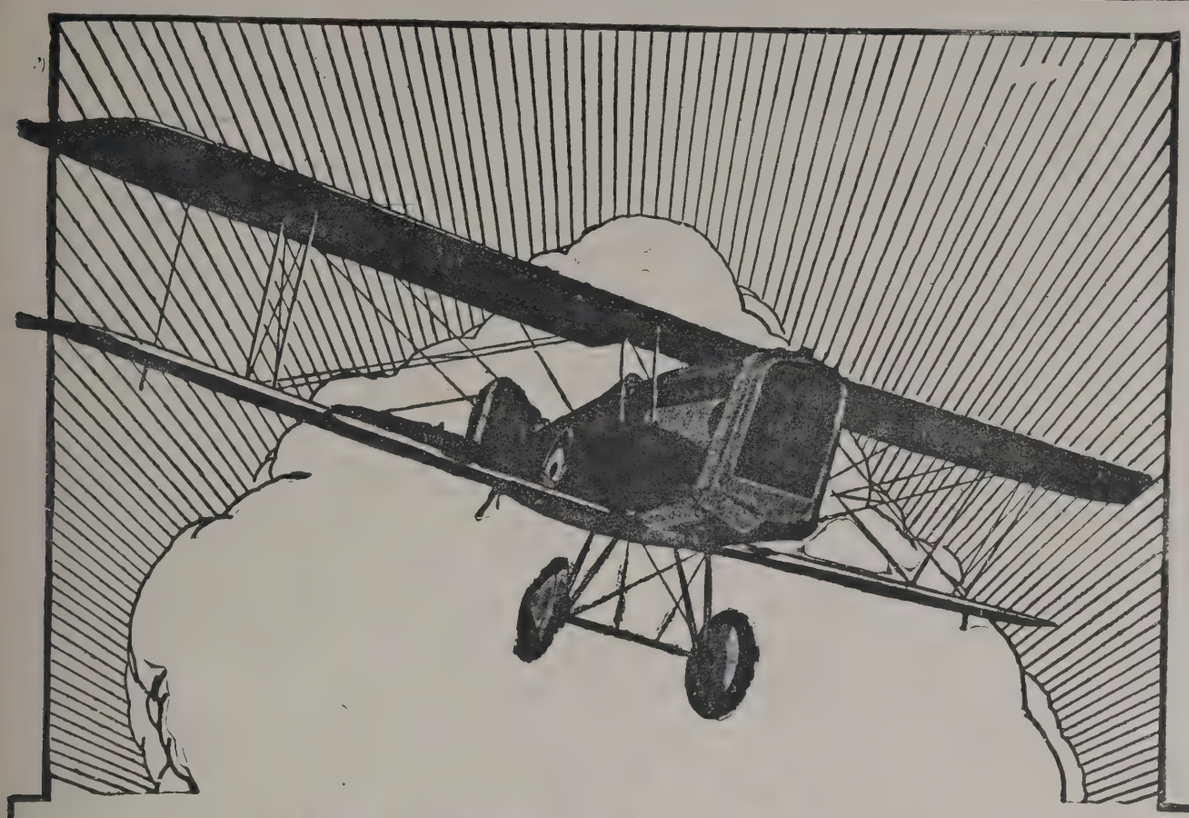
Most people know the term "Phillips' Entry" as applied to the formation of the leading portion of an aerofoil, and understand thereby that form of entry which results from beginning the under surface of the aerofoil by a curvature convex downwards, which shortly changes into a curvature in the opposite sense, and now is a standard feature of all modern British high-speed aerofoils.

It is interesting here to recall that in 1911 the N.P.L. authorities pronounced this type of entry to have no appreciable effect on the aerodynamic properties of an aerofoil, whilst in this year of grace we find Lord Weir, on the authority, one presumes, of the same N.P.L. and its offspring, holding up German designers to mild contempt because they never employed an aerofoil section with that characteristic.

The cream of the particular jest, however, is that Mr. Phillips himself disclaims all responsibility for this particular feature, and has himself always considered that the Phillips entry properly so called consisted merely in a leading edge to an aerofoil formed by the junction of a convex upper surface with a flat or concave lower surface.

The early experimental work carried out by Mr. Phillips deserves to be widely known and appreciated.

Mr. Phillips began his experiments some time in the seventies, but so far as can be discovered no account of his results was published before 1885.



In that year was published the complete specification of a patent (No. 13768 of 1884) entitled "Apparatus for Aerial Navigation," wherein are shown the figures of wing sections which are reproduced here, together with Mr. Phillips' original complete specification.

A.D. 1884.—No. 13,768.—APPARATUS FOR AERIAL NAVIGATION.

COMPLETE SPECIFICATION.

I, Horatio Frederick Phillips, of 31, Chapel Street, Park Lane, in the County of Middlesex, engineer, do hereby declare the nature of my said invention for "Apparatus for Aerial Navigation" and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:—

My invention relates to means to be used in conjunction with suitable propelling apparatus for raising and supporting an aerial machine or vehicle in the air. For this purpose I provide the machine with a series of narrow blades arranged at suitable distances apart so that air may act independently upon each without disturbance by the others. The object of these blades is to deflect upward air that comes in contact with their forward edges or portions in such a way as to cause a partial vacuum to be created over a portion of the upper surface of the blade thus aiding the air below to support the weight. To this end the blades are made with doubly curved or inclined upper surfaces. The under sides of the blades may be flat or concave in cross sectional form; whilst the upper surfaces may be convex in cross section or of a form bevelled towards each edge. The curvature of the convexity or the degrees of angularity as the case may be will depend upon circumstances.

The propellers employed may with advantage be constructed with blades to operate on the same principle.

Upon the annexed sheet of drawings there are shown in cross section various forms of blades according to my invention. Some of these are comparatively narrow, and some are broader, but all are characterised by having doubly curved or inclined upper surfaces, with flat or concave under surfaces. In Figs. 1 and 2 the under surfaces are flat or very nearly so, while the curvature of the upper surface is not great. In Fig. 3 the curvature is more marked. Figs 4 and 5 are broader examples with a moderate degree of curvature both above and below. Fig. 6 shows an extreme case in which the distinguishing features of the invention are probably carried to excess. It, however, serves admirably to demonstrate the phenomenon which it is the object to produce, for if a current of air be made to impinge upon it in the direction of the arrow a_0, it can be shown by means of a delicate gauge, such as a ribbon or thread that an induced current flows in the direction of the arrow a_1. Figs 7 and 8 are also sections of forms used to demonstrate the action of the air upon the blades, and to show that the air is deflected upwards by the forward part of the upper surface and a vacuum is formed on the after-part. If blades of this section be pivoted at their front edges, or at a point in advance of their front edges, and be exposed to a current of air of sufficient velocity coming in the direction of the arrow they will rise into the position shown (with relation to the direction of the current) in the drawings.

It is advantageous that the greatest depth of hollow should be one-third of the total width from the forward or leading edge, and the amount of concavity of the lower surface and convexity of the upper surface should bear a relation to the speed of the air current, when this is possible.

Having now particularly described and ascertained the nature of my said invention and in what manner the same is to be performed, I declare that what I claim is

1. The use for raising, supporting and propelling aerial machines or vehicles, of blades of the form substantially as deviewed in cross-section, are bounded by one or more curved lines, or by two or more straight lines, or by curved and straight lines, so arranged that a current of air striking the forward edge of the blade at an acute angle is deflected upwards by the forward part of the surface, and a vacuum (or partial vacuum) is formed on the after surface substantially as described.

2. The use for raising, supporting and propelling aerial machines or vehicles, of blades of the form substantially as described with reference to and illustrated in the drawings annexed.

Dated this 11th day of July, 1885.

H. F. Phillips,
W. Lloyd Wise,
46, Lincoln's Inn Fields,
London, W.C.,
Applicant's Agent.

In the same year ("Engineering," August 14th, 1885) there appeared a description of Mr. Phillips' experiments and results, including descriptions of the wind tunnel which he used for tests.

In this tunnel an air flow was secured by the use of a steam jet in an expanding chamber which formed the exhaust end of the wind tunnel itself. This jet and expanding chamber acted in effect as does an injector, and air speeds up to 60 ft. per second were obtained.

A very simple form of balance permitted measurements of lift and resistance to be made.

Mr. Phillips' Discoveries.

As the result of these experiments Mr. Phillips arrived not merely at the essential section necessary for a reasonably efficient aerofoil, but discovered the fact that a serious loss occurred at the tip of a wing which could be reduced by increasing the aspect ratio.

Mr. Phillips also realised at a very early date that the lift of an aerofoil was due to the fact that air was deflected downwards by the aerofoil, and that therefore tandem surfaces were inefficient because the after surfaces ran in the down wash of the forward one.

These considerations led to the adoption of a multiplane construction, which has been aptly likened in form to a Venetian blind, wherein each lath was an aerofoil of the type of section described in his 1884 patent.

On May 5th, 1893, "Engineering" illustrated the machine built on these lines, and described a test made with it running round a circular track, on which occasion the machine lifted a weight of over 400 lbs. to some two or three feet.

In the same article Mr. Phillips' whirling arm, used for making tests at higher air speeds than those possible in the wind tunnel, was described.

It will thus be seen that, although Mr. Phillips has no connection with the so-called Phillips entry, he did discover the essential features of the cambered aerofoil, and measured their qualities with the aid of wind tunnel and whirling arm before most of our present wind tunnel experts were breeched—if they existed at all.—W. H. S.

THE AIR CONVENTION.

Thirteen Allied Powers signed the International Aerial Navigation Convention at Paris on Oct. 13th. Japan and the United States did not sign. The latter would not because in the opinion of their Patent Office certain American patents would not be protected. The United States has six months in which to accept or reject the Convention.

The official "white paper" containing the full text of the Convention can be obtained for 9d. from any law bookseller.

THE DOUGLAS-PENNANT CASE.

The inquiry into the dismissal or retirement of Miss Douglas-Pennant opened on Oct. 14th, 1919, under the presidency of the Lord Wrenbury in a committee-room of the House of Lords. In view of the great length and entire irrelevancy of the opening speech and the first minutes of evidence it is not proposed to summarise the case until the committee has concluded its sittings.

THE ENGLAND TO AUSTRALIA FLIGHT.

Capt. Matthews and Serjeant Kay on a Sopwith biplane, "Wallaby," began their flight to Australia on Oct. 21st, 1919. They left Hounslow at 11.44 a.m.

THE R.N.A.S. AGAIN.

Since the coming of Sir David Beatty (as he is still, for the present) to the Admiralty there has been a persistent revival of the rumour current some time ago that the Admiralty intends to have its own Naval Air Service.

As is fairly well known, Lord Jellicoe's intelligence never quite grasped the possibilities of aircraft for naval purposes, whereas Sir David Beatty was probably the first officer of his seniority in the Navy to appreciate what aeroplanes could do and to encourage the down-trodden and almost discredited R.N.A.S. to renewed efforts.

The revival of the rumour may be merely a case of "the wish being father to the thought," but recent happenings have certainly impressed even the most case-hardened of naval men with the futility of a Fleet which is not strongly equipped with aircraft as part of its own organisation, and though the rumour may have been revived by ex-R.N.A.S. people it is certainly being strongly backed by officers of the Royal Navy.

CONGRATULATIONS.

MANNING.—On Oct. 15th, at Park House, Thrackley, the wife of W. O. Manning, Esq.—a son.

FROM THE COURT CIRCULAR.

St. James's Palace, Oct. 18th.

By command of The King Lieut.-Colonel Prince Arthur of Connaught held an Investiture in the Throne Room, St. James's Palace at 11.30 o'clock this morning, on His Majesty's behalf.

The following was invested with the Insignia of The Most Excellent Order of the British Empire:—Officer.—Military Division.—Capt. George Rogers, R.A.F.

His Royal Highness then conferred decorations as follows:—

The Military Cross.—Capt. Cecil Marchant, R.A.F.; Lieut. Leonard Dodson (S. Staffordshire Reg.), attd. R.A.F.

NAVAL.

Admiralty Appointment.

Oct. 20th.—R.A.F.—Flt. Lieut.—D. S. Earp, to "Pegasus" (Aug. 1st).

* * *

From a Supplement of the "London Gazette" of Oct. 7th, 1919, dated Thursday, Oct. 9th, 1919.

Admiralty, Oct. 9th, 1919.

The following dispatch has been received from the Rear-Admiral, Black Sea, on the action in the Caspian Sea off Fort Alexandrovsk on May 21st, 1919:—

July 5th, 1919.

I have the honour to submit the following dispatch on the action off Fort Alexandrovsk on May 21st, 1919, with an account of the circumstances leading up to it and all subsequent operations:—

At the beginning of May reports were being received from various sources that the Bolsheviks had occupied, or intended to occupy, Fort Alexandrovsk. From reports of refugees, prisoners, etc., it was also apparent that the Naval Authorities at Astrakhan were desirous of carrying out an attack on Petrovsk or Baku with the object of obtaining oil, of which they were in urgent need. . . . .

2.—Commodore Norris determined, therefore, to visit Fort Alexandrovsk and to carry out a reconnaissance by means of the coastal motor-boats and by the seaplanes of "A. Yusanoff," supported by the ships of the Caspian Squadron. .

4.—On May 17th the wind had gone round to west, so that no lee was obtainable on the eastern shore of the Caspian. Consequently (after an unsuccessful attempt to get the seaplanes away) the seaplane carrier had to return to Petrovsk, escorted by "Emile Nobel," who was running short of fuel. By this time Commodore Norris had news of reinforcements in the shape of "Venture," and he cruised off the eastern shores of the Caspian to the southward to await her arrival.

5.—In addition to "Venture" he was joined by "Windsor Castle" and "Emile Nobel," and on the morning of May 21st was cruising in position lat. 44.57 N., long. 50.02 E. Course S.E., speed 5 knots. Detached squadron, consisting of the C.M.B. carriers and seaplane carrier, had parted company on May 20th, with orders to rendezvous off Fort Alexandrovsk. . . .

19.—Later . . . the detached squadron of C.M.B. and seaplane carriers had arrived at rendezvous, and a seaplane had been sent up to bomb Alexandrovsk. Unfortunately, he had to return owing to engine trouble, and was out of action for 12 hours. He again went up at 15.35, and returned two hours later. Bombs were dropped, but no direct hits were obtained. He reported that a large oil steamer was burning as a result of the bombardment of the afternoon. . . . .

21.—At 05.25 the seaplane again started for Fort Alexandrovsk and dropped bombs on the shipping in the harbour and small craft machine-gunned. During May 22nd five raids were carried out by this one seaplane with the following results:—

First Raid.—Shipping and Eastern Pier bombed and machine-gunned. No direct hits, but probably some damage done as bombs fell close.

Second Raid.—Shipping bombed. Direct hits obtained on large destroyer of "Finn" class, which sank. One hit on armed merchant cruiser. Ships and piers machine-gunned.

Third Raid.—Barges at eastern and western piers bombed. No direct hits, but bombs fell very close, and damage was probably inflicted.

Fourth Raid.—Shipping bombed. No direct hits. T.B.D. bombed in second raid now completely sunk.

Fifth Raid.—Southern pier bombed. Bombs fell very close. Shipping machine-gunned.

A sixth raid was attempted, but machines failed to rise. Photographs were taken on second and fifth raids.

22.—On the evening of 22nd and on the morning of 23rd a deserted appearance of ships and town was noticed, no one being seen in streets nor on decks of ships. No armed forces or encampments were seen in vicinity. On the first day heavy A.A. fire was experienced, but on the evening of 22nd and morning of 23rd there was none. . . . .

24.—On May 23rd, after a night of thick fog, "Kruger" and "Venture" were attacked by two enemy destroyers, who had the range and speed of them, so that they were forced to withdraw. The carriers were informed of the presence of the enemy by W./T., a seaplane was again got out to attack the enemy. Unfortunately the seaplane was unable to locate the enemy destroyers, and finally carried out another raid on Fort Alexandrovsk.

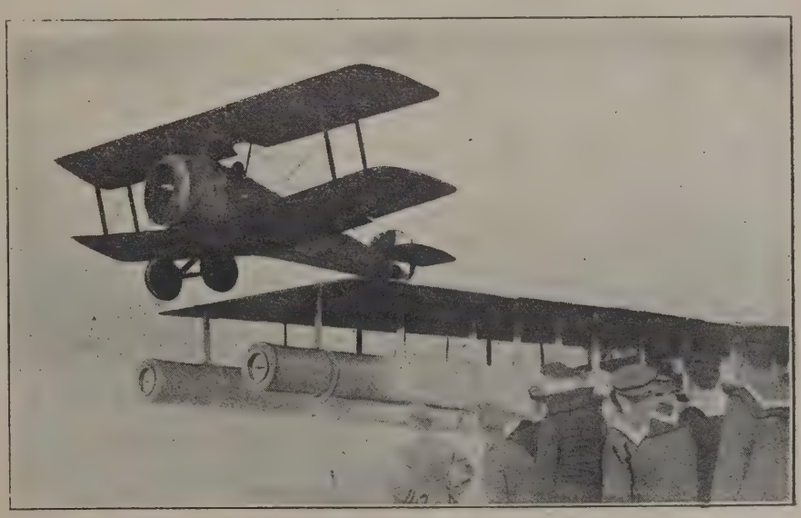
It is probable that the enemy sighted the carriers, as they suddenly turned towards "Kruger" and then made off to the northward. The seaplane ran into a fog on her way back from Fort Alexandrovsk and fell in the water. The officers were not picked up until 32 hours later (see par. 25 below).

25.—On May 24th Commodore Norris in "Kruger," who was short of fuel, with "Sergie" and "Edinburgh Castle," parted company and proceeded to Petrovsk, leaving Capt. Washington in charge of the squadron, which now consisted of "Windsor Castle," "Asia," "Venture," "Bibi-Abat," and "A. Yusanoff," with orders to cruise to the northward and search for the missing seaplane, to ascertain that Chechan was safe, and, when the carriers returned, to make an extended reconnaissance of Port Alexandrovsk. The seaplane was picked up on the evening of May 24th, after which the squadron cruised between Port Alexandrovsk and Chechan until the carriers arrived.

28.—I have the honour to call particular attention to the services rendered by the following officers of the Royal Air Force who between them carried out five raids in one seaplane on the same day with excellent results, and attempted a sixth, and also the services of Lieut. Chilton, R.N.R., commanding "A. Yusanoff," for his able handling of the ship and organisation which allowed this to be done.

Pilots—
Sec. Lieut. Howard Grant Thompson.
Capt. John Archer Sadler.
Sec. Lieut. Robert George Kear Morrison.

Observers—
Lieut. Frank Russell Bicknell.
Sec. Lieut. Frank Leslie Kingham.
Sec. Lieut. Henry Godwin Pratt.



(Signed) M. SEYMOUR, Rear-Admiral.

* * *

According to the "Times" Naval correspondent it is the intention of the Admiralty to allow a number of the surplus junior Naval officers to transfer from the Royal Navy to the Royal Air Force. No official confirmation has been received, but the article in the "Times" gives the following particulars:—

"The junior officers of whom the Air Ministry are prepared to take a certain number must have passed through Osborne and Dartmouth, and must be over the age of 18½ years and under the age of 20 on Feb. 1st next. They will be admitted to the Royal Air Force College without examination and without being called upon to pay fees, apart from the cost of books and instruments. Each applicant for admission under the new arrangements will be required to pass a

AVIATION IN THE ROYAL NAVY.—A Sopwith Camel (130 h.p. Clerget engine) getting off from a platform laid over the guns of one of the larger battleships. The machine apparently has her tail down when she leaves the platform. At the best this method of using ship-planes is unsatisfactory, as the platform, being only a temporary affair, must be removed when the flight is finished. One wonders when the Admiralty will awake to the possibilities of other methods of launching ship-planes.

medical test prescribed by the Air Council, and to appear before an interviewing board.

In the event of an accepted candidate being found unsuitable for flying within six months of the date of entry into the college, he will return to the Naval Service, but it must be understood that with this exception candidates leaving the Royal Air Force for any reason will have no claim to be taken back into the Navy.

Those who become cadets at the Air Force College will be required to undergo instruction there for only one year, instead of the two years required of ordinary cadets, and they will receive pay at the rate of 10s. a day.

The successful candidates will enter upon their new studies probably next February, but it is not stated whether this avenue of transfer from the Navy to the Air Force will remain open after that date. The written consent of the officer's parent or guardian to his transfer, if selected, has to be given before his application can be entertained.

Cooksey, Sec. Lt. K. B., R. W. Kent R., attd. R.F.C.

Williams, Sec. Lt. C. P., R.F.C.

GREAT BRITAIN.

East Fortune.

It is rumoured in the daily Press that the Air Ministry are about to abandon the aerodrome at East Fortune, Haddingstone, and that all plant and material will be moved to another aerodrome in Yorkshire. It is also said that H.M.A. R.29 is to be broken up.

In connection with this the Edinburgh "Evening News" of Oct. 14th says :—

"A great deal of fuss is being made regarding the removal of the East Fortune Aerodrome. The County Council of East Lothian has passed a resolution of protest. We are all for giving Scotland a share of the Services. Scotland in pre-war times never was well-treated by the Army or the Navy, but the period has come when we must put our likes and dislikes aside, and only spend money where it is necessary.

"One of the strategists of the Council, a Baronet, said it was of essential importance that such a defensive air station should remain—not only for the protection of the Fleet, which had one of its most important bases at the Firth of Forth—but also for the safeguarding of Edinburgh and the east of Scotland generally. This expert might have been a little more definite in his opinion. Who is the enemy we are now preparing against? Is it Germany? We thought the German Fleet was at the bottom of Scapa Flow. We thought the German Army was to be reduced to a few ten thousands of men.

"Air stations, Fleets, and Armies are all based on policy, and assuredly to-day there is no likelihood whatever of war in the North Sea in our time. The scene may be farther afield in the Atlantic or the Pacific, but that is an eventuality which we may sincerely hope will not trouble this generation or the next. It is no use calling on the Government to economise if every step they take is bitterly criticised by interested public bodies."

A Permanent Commission.

It is stated unofficially that the Royal Air Station at Howden, Yorks, is to remain as a permanent base for airships, principally in connection with the Coast Defences. It is also said that much of the personnel and matériel from the East Fortune Aerodrome will be taken to Howden, including H.M.A. R.29. Another unofficial statement of this kind announced the immediate break-up of R.29.

A new shed is in the course of erection at this station, and is now approaching completion. It has a length of 750 ft. and a height of 120 ft., and is built of corrugated steel. The shed will be capable of housing such airships of the R.34 and others of that size.

Milton, Berks.

The Milton (Berks) R.A.F. Depot is expected to close down during November. Civilian labour is to cease and notices to this effect have been posted. One-seventh of the men employed there will be discharged weekly.

A "Business" Flight.

Mr. N. St. J. Philby, a British Political Officer, being ordered to Arabia to settle the dispute between two native chiefs, flew from Folkestone to Cairo, a distance of 2,100 miles, in 123 hrs.

A Misplaced Landing.

A Vickers "Vimy" bomber made a trial flight at Farnborough recently. The pilot intended to land on the Common, but he landed on the top of a taxicab instead. The cab was somewhat crushed, but neither the pilot, the cab-driver, or his passengers were injured. It is stated that the aeroplane escaped damage, but one cannot infer that the machine flew off the taxicab.

Souvenir Hunting.

Twelve residents of Hildenborough, near Tonbridge, were charged at the local police court on Oct. 21st with being in unlawful possession of equipment taken, it is alleged, from a Service aeroplane, which after making a descent in the neighbourhood was left unattended in a field.

The Freedom of Carnarvon.

The Town Council of Carnarvon have decided to confer the freedom of the borough on Wing. Cmdr. Lionel B. Rees, V.C., O.B.E., M.C., A.F.C., R.A.F., and to present him with a sword of honour, as a mark of appreciation of his distinguished services in the war.

CHILE.

According to the "Times" of Oct. 21st, the Chile Aerial Forces Department has decided to accept the offer of a British house to establish works for the construction of aeroplanes in Chile.

DENMARK.

The Danish correspondent of The Aeroplane writes :—

On board the Danish cruiser "Heimdal," which has just left Copenhagen for England, the commanding officer of the Naval air station at Copenhagen, Lieut. Grandjean, travels together with two Navy officer pilots, Lieut. Victor and Lieut. Abrahamsen, of the Reserve, with the object of studying Allied Naval aviation. Having introduced the two last-mentioned officers, who are to undergo further instruction of some months' duration at British Naval air stations, Lieut. Grandjean continues to France to learn of the French Naval air stations.

At the same time a number of Army pilots are to go for further instruction to France on Nov. 1st, being the chief pilot, Lieut. Forslev, who is to study aeronautic science for two years at "L'Ecole Superieur d'Aeronautique à Paris," while the practical training shall last three to four months of Lieuts. Folkmar and Botved, Lieuts. of the Reserve Herschend and Sætter-Lassen, and Serjts. Erlind, Bjarkow, Johansen, and Larsen, as well as the chief of the aircraft workshops department of the Army Technical Corps, the Army pilot Nielsen and his assistant Christoffersen.

FRANCE.

General Duval, Director of Military Aeronautics, has decided that Nimes will be an aero station in the future network of aerial services in France.

An Exploit of Captain Hirschauer.

Captain Hirschauer, commanding the technical branch of Military Aeronautics, piloted on Oct. 1st an airship, an aeroplane, and a free balloon in a period of four hours. At 8.30 a.m. he left Villacoublay on an aeroplane and landed again at 9.0 a.m. An hour later he left Saint Cyr alone in a spherical balloon, which he brought down at Saint Nom-la-Bretèche at 10.30 a.m. He arrived at Saint Cyr by motor-car at 11.30 a.m. and took to the higher atmosphere again in a Zodiac airship, type V.Z 10, at noon, taking the wheel himself. This flight concluded at 12.30 p.m.

Captain Hirschauer took his three certificates on the following dates :—Spherical balloon, 1911; airship, 1912; and aeroplane, 1915. It is curious that no other pilot has made a similar effort in piloting as was done by Captain Hirschauer in the above-quoted case.

A Skirmish in Morocco.

On Oct. 3rd a food convoy proceeding to Menitra was attacked to the west of Djebel Aarar by a party of about 1,000 insurgents commanded by Ou el Amdi and Fets Ali Ataouch. The French levies fought well and drove off the enemy, causing them to leave 102 dead on the field. The French casualties were 11 levies killed and 27 wounded. French military aeroplanes assisted and contributed largely to the complete rout of the enemy.

The Start of the War.

In October of last year a French court martial sentenced an engineer named Unné to five years' imprisonment and a fine of £1,300 for having given money to officers and non-commissioned officers charged to superintend the trials of aviation engines. M. Unné was in America when the sentence was passed, but he afterwards appeared before the court martial which acquitted him after hearing his appeal.

He told the strange story that towards the end of July, 1914, an aeroplane belonging to the Salmson Co., piloted by a M. Laporte, started on a journey from Paris to Constantinople. The machine had a breakdown in Bavaria, and M. Unné was sent to repair the damage.

The German authorities prevented M. Laporte from con-

SPEED

A racing Airco Machine, piloted by Capt. Gathergood, leaving for Paris at 12.30 p.m. with specially urgent dispatches, completed the flight from Hounslow to Le Bourget in 1 hour 20 minutes; a rate of 180 miles an hour, the greatest speed attained so far on the London-Paris route.

Extract from the "Times," Friday, Oct. 17, 1919.

AIRCO

THE AIRCRAFT MANUFACTURING CO., LTD.,

Chairman (and Founder, 1911): G. HOLT THOMAS.

London Office: 27, BUCKINGHAM GATE, LONDON, S.W.1.

Works: THE HYDE, HENDON, N.W.9.

tinuing his journey, and after a lapse of two days gave him permission to return to France on August 1st, specifying the route he should follow. As he was flying over Nuremburg, guns opened fire on him, but he succeeded in reaching France.

The German Embassy said that the town had been bombed by a French aeroplane, which was an act of war. This was given as Germany's reason for declaring war on France.

The story seems worthy to set alongside some of the stories which have been told at British official enquiries.

HOLLAND.

A Bristol Fighter in the Dutch Army.

A Bristol fighter belonging to the Dutch Army is now at Hendon. It was flown from Holland to England some time ago by Lieut. Versteegh, Royal Netherlands Army, with an officer-observer as passenger. The machine has been flown to various parts of England during its stay in the country. One of these visits was to its birthplace at Bristol. In view of the common arguments as to the durability of aircraft it should be here stated that this Bristol fighter is two years old and has been in continuous use both on the Western Front and in Holland.

A red cock has been painted on the sides of the fuselage by those in whose charge it is.

RUSSIA.

Operations in Russia.

Many and conflicting are the reports of the fighting in the Petrograd district, some accounts even stating that the town has been taken from the Bolshevists. The more reliable reports state that on Oct. 17th the British Royal Air Force attacked the fortress town of Krasnaya Gorka in force, while Kronstad was practically neglected, being visited by a solitary aviator. On Oct. 16th British aviators reported that the Bolshevists were retiring in disorder from Krasnaya Gorka on Petrograd, but, as will be seen, the Bolshevists were still in the former town on the 17th. On Oct. 19th British aviators reported the Red flag was again flying over Kronstad.

SWITZERLAND.

The Italian correspondent of The Aeroplane writes :—

This country would appear to possess six Military aerodromes in full equipment. They are Berne, Dübendorf, Neuchatel, Geneva, Zurich, and Montana, which is also one of the highest health resorts. Lausanne and Bellingona are also coming centres. A regular series of propaganda tours is to start shortly under military control.

Flying at less than 3,000 ft over big towns is to be avoided in case of disasters. A feeling similar to the anti-motor rabies is said to exist towards aeroplanes, though no accident seems ever to have occurred.

The Haefeli seems the most liked of Swiss machines. It is an 8-metre span by 6 metres long Farman type, with a 150 M.F.W. (Winterthur), with which it can do 180 kilos. per hour. The weight is put at 1,100 kilograms fully loaded with two on board.

U.S.A.

A Criticism.

The correspondent of the "Daily Telegraph" writes from New York on Oct. 16th as follows :—

"Some criticism is being heard, both in the newspapers and in Congress, over the fact that the aeroplane race across the Continent and back, which, it is expected, will be won to-morrow evening by Lieut. Maynard, 'the flying parson,' has so far resulted in nine deaths and many more or less serious injuries.

"According to Brig.-General Mitchell, chief of operations and training in the Army Air Service, all the aviators killed were flying De Haviland Fours, which, he declared, were faulty and a type of plane not wanted by the Service.

"He criticised the De Haviland as a compromise between a bomber and an observation plane, and said the pilot was placed in an unnecessary dangerous position between the unprotected petrol tank and the engine, while the plane altogether was too delicate near the ground. Out of 53 De Havilands entered, only 31 now remained in the race."

[The correspondent of the "Telegraph" might have explained, if he had known, that the D.Hs. used were American-built, to designs altered (or, as some people say, mangled) in America to take the Liberty engine. The result, one gathers, is a machine which is thoroughly nasty to fly, being heavy on its controls, and very much faster in landing than the original machine as designed by Capt. de Havilland. Therefore, one can safely say that there is nothing in General Mitchell's criticisms which reflects adversely on the Aircraft Manufacturing Co., Ltd, or its talented chief designer.—Ed.]

The Trans-Continental Air Race.

Despite a Reuter message from New York on Oct. 12th stating that the return flight across the Continent would start on Oct. 20th, unless the race was discontinued, Lieut. B. W. Maynard left San Francisco for his return flight to New York on Oct. 14th at 1.22 p.m. That night he landed at Battlemountain, in Nevada, having crossed the Sierra Nevada Mountains, his worst obstacle, and covered 356 miles.

Capt. Delavergne, the French air attaché, has had more bad luck. He started the race on Oct. 8th in a machine piloted by Lieut. D. B. Gish, which caught fire in the air. Afterwards he started again as a passenger in a Martin bomber.

This machine carried four passengers and was piloted by Capt. Roy N. Francis. In Nebraska they ran into some telegraph wires and wrecked the machine. It is reported that none was seriously hurt.

A Reuter message from New York dated Oct. 14th stated that three more competitors had arrived at San Francisco and three more at Mineola.

Lieut. B. Maynard, the first aviator to complete the return journey across the continent, landed at Mineola at 1.50 p.m. on Oct. 18th. The unofficial computation of his flying time from San Francisco is 25 hours, which is 15 minutes less than the time he took to fly from Long Island to San Francisco.

On his arrival at Mineola he was greeted by a large crowd and had to shake hands with about a thousand persons before the aerodrome officials were able to get near him to obtain his log book. At Omaha Lieut. Maynard lost 19 hours while obtaining a Liberty engine from the wrecked Martin bomber of a competitor, his own engine having given out.

Lieut. Maynard has stated that now the race is over he intends to leave the Army and return to his country parish.

TO NO. 8 NAVAL SQUADRON.

A Reunion Dinner of No. 208 Squadron R.A.F. (No. 8 Naval Squadron) will be held on Nov. 1st. This dinner, as distinct from Squadron dinners held hitherto, is a re-union of officers and men, and is not for officers only. Already over 100 of the former personnel of No. 8 Naval Squadron have signified their intention of being present, and it is hoped that at least as many more will be present on Nov. 1st.

The price of the dinner, without drinks, is seven and sixpence. Those who wish to attend are invited to communicate immediately with Mr. F. Hammond (late of the Transport Section, No. 8 Squadron), at No. 10, Ashbourne Grove, East Dulwich, S.E.

The Chair will be taken by Wing-Commander Bromet, D.S.O., O.B.E., the first Commanding Officer of No. 8 Squadron, supported by Major Christopher Draper, D.S.C., and Squadron-Leader Compston, D.S.C., D.F.C., Captain Jordan, and other present and former officers of the Squadron.

A GRAIN DINNER.

The first annual dinner of officers who were stationed at the Isle of Grain Air Station during the war is to be held at the Café Royal Restaurant, Regent Street, on Saturday, Nov. 8th.

Will all officers who formed part of the Grain complement, and who wish to attend, but who have not received direct notification of the event, communicate with Capt. L. A. T. Pritchard at Wadham College, Oxford?

Tickets are 15s. each, exclusive of wine, and applications must be made not later than Oct. 29th. Dress, dinner jacket or uniform.

It is hoped that the traditions of Grain Mess on festival occasions will be fully maintained on this occasion, and that its old members will turn out in full force to do their bit.

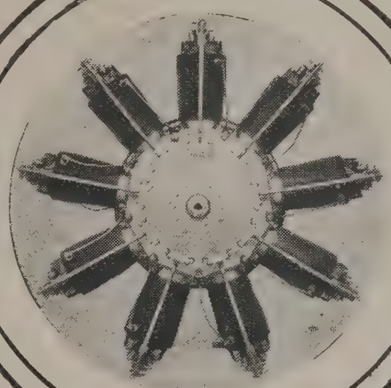
[The heading of this paragraph refers to the place and not to the menu.—Ed.]

THE CRY OF THE DEMOBILISED.

The following letter has been received :—

Sir,—We were all demobbed six months ago; our average age is 36; we all gave up everything and joined in 1915. We have all been hurt in some way; some of us have wooden legs. We all registered at St. Ermin's, Horrex's, and Dashwood House for jobs; nothing doing. Now, the Air Ministry advertise in the "Morning Post" for ex-Officers.

What's the use of St. Ermin's, Horrex's and Dashwood House? We give it up, but we want JOBS.



(Signed) "Six Ex-Officers."

[Though it is not customary to take any notice of anonymous letters, this is published in the hope that one or more of the Six will communicate personally with the Editor of The Aeroplane. The answer to the question has still to be discovered.—Ed.]

ROYAL UNITED SERVICE INSTITUTION.

Among the lectures to be delivered at the Royal United Service Institution during the autumn and winter is the following :—

Dec. 3rd.—"The Air Force." By Air Commodore H. R. Brooke-Popham.

This lecture will begin at 3 p.m.

THE ROYAL AERONAUTICAL SOCIETY.

The following programme of lectures has been arranged for the 65th Session of the Royal Aeronautical Society. The meetings occur in each case at the rooms of the Royal School of Arts, 4, John Street, Adelphi, London, W.C., at 8 p.m..

Wednesday, Oct. 29th.—"The Static Head Turn Indicator for Aeroplanes," by Sir Horace Darwin, K.B.E., M.A., F.R.S. Chair to be taken by Brig.-Gen. R. K Bagnall Wild, C.M.G., C.B.E., R.E.

Wednesday, Nov. 12th.—"Some Physical and Psychical Effects of Altitude" by Chas. Atkin Swan, L.R.C.P., M.R.C.S., M.B., Ch.M. Chair to be taken by Sir W. Arbuthnot Lane, Bart., C.B., F.R.C.S.

Wednesday, Nov. 26th.—"Some Kite Balloon Experiments," by Griffith Brewer. Chair to be taken by Brig.-Gen. E. M. Maitland, D.S.O.

Wednesday, Dec. 10th.—"Aircraft Undercarriages," by J D North. Chair to be taken by Lieut.-Col. M. O'Gorman. C.B.

Visitors may attend the ordinary meetings on the introduction of a member of the Society. Applications for tickets should be made to the Secretary at the offices of the Society, 7, Albemarle Street, London, W.1.

ROYAL AERO CLUB NOTICES.

SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS AND THE ROYAL AERO CLUB.—A meeting of the Joint Standing Committee of the Society of British Aircraft Constructors and the Royal Aero Club was held at the Royal Aero Club, 3, Clifford Street, London, W.1, on Wednesday, Oct. 8th, 1919, when there were present :—Royal Aero Club : Lieut.-Col. F K. McClean, in the Chair, Lieut.-Col. Alec Ogilvie and Harold E. Perrin, Secretary (Representing Royal Aero Club), Society of British Aircraft Constructors : Capt. P. D. Acland, Mr. Hamilton Fulton. In attendance : Mr G. Holt Thomas and Charles V. Allen, Secretary (Representing Society of British Aircraft Constructors).

AUSTRALIAN FLIGHT.—It was reported that the alighting ground at Singapore was on the Race Course and from the information received from General Borton, who had surveyed the route, it was considered suitable.

ROYAL AERO CLUB SEAPLANE COMPETITION.—It was decided to recommend that the Competition which had been postponed owing to the Railway Strike, be further postponed till next year.

[It will be noticed that none of the representatives of the S.B.A.C. at this meeting were members of any of the firms which had entered for the Schneider Cup competition, or of firms which have been associated in the past with the design or construction of seaplanes other than big flying-boats. Also it will be noted that none of the representatives of the Royal Aero Club has been closely associated with modern seaplane work.—ED.]

SPECIAL COMMITTEE MEETING.—A Special Meeting of the Committee was held on Wednesday, October 15th, 1919, when there were present : Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S., in the Chair, Mr. Ernest C. Bucknall, Lieut.-Col. F. K. McClean, Lieut.-Col. J T. C. Moore-Brabazon, M.P., Lieut.-Col. Alec Ogilvie, Group Captain C. R. Samson, C.M.G., D.S.O., R.A.F., and the Secretary.

ROYAL AERO CLUB SEAPLANE COMPETITION.—The recommendation of the Joint Standing Committee of the Royal Aero Club and Society of British Aircraft Constructors was received, and it was decided to postpone the Competition till next year.

THE FLYING SERVICES FUND COMMITTEE.

A meeting of the Flying Services Fund Committee was held on Friday, October 17th, 1919, when there were present : Group Captain C R. Samson, C.M.G., D.S.O., R.A.F., in the Chair, Mr. Chester Fox, Squadron-Leader T. O.'B Hubbard, M.C., R.A.F., and the Secretary.

GRANTS AND ALLOWANCES.—The following Grants and Allowances were made :—(33) An allowance of £2 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Flying Corps killed on active service. (89) An allowance of £2 a month for six months to the widow of a Private in the Royal Flying Corps killed on active service. (119) An allowance of £2 a month for six months to the widow of a Flight Sergeant in the Royal Air Force who died on active service. (122) The School Fees up to £10 of the sons of the widow of a 2nd Class Air Mechanic in the Royal Flying Corps killed on active service. (159) An allowance of £2 a month for six months to the mother of a 2nd Class Air Mechanic in the Royal Air Service killed on active service. (168) An allowance of £3 a month for six months to the mother of a Private in the Royal Air Force who died on active service.

(173) An allowance of £2 a month for three months to the widow of a 3rd Class Air Mechanic in the Royal Air Force who died on active service. (190) An allowance of £2 a month for six months to the mother of a 2nd Class Air Mechanic in the Royal Air Force who died on active sevrice. (254) An allowance of £2 a month for six months to the father of a 1st Aircraftsman in the Royal Air Force who died on active service. (261) A grant of £14 12s. 6d., an allowance of £3 a month for six months, and the school fees of the son of the widow of a Corporal in the Royal Air Force killed on active service. (266) An allowance of £1 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Air Force who died on active service. (267) A grant up to £31 10s. to a Flight Cadet in the Royal Air Force incapacitated on active service.

(269) An allowance of £2 a month for six months and the school fees of a daughter of the mother of a Sergeant in the Royal Air Force killed on active service (270) An allowance of £2 a month for six months to the mother of a Corporal in the Royal Air Force who died on active service. (271) A grant of £5 and an allowance of £4 a month for six months to the widow of a Sergeant in the Royal Air Force who died on active service.

COUPE DEUTSCH DE LA MEURTHE.

The Aero Club de France has provisionally awarded the Coupe Deutsch de la Meurthe to M. Sadi Lecointe, who completed the circuit of about 200 kilometres embracing Terrasse de St. Germain, Senlis, Meaux, Melun, Terrasse de St. Germain, on October 15th, 1919, at an average speed of 249 kils. 719 m. an hour. In order that a new Competitor may become the provisional holder of the Cup, it is necessary for this speed to be beaten by one-tenth.

[The speed is equal to about 155 m.p.h., so that to become the holder of the Cup the next competitor must do at least 170½ m.p.h. —ED.]

GREAT BRITAIN TO AUSTRALIA FLIGHT.

The following are the entries for the £10,000 Prize offered by the Australian Government for a flight from Great Britain to Australia :—

Pilot & Navigator	Crew.	Machine.	Engine.
Capt. Cedric Ernest Howell, D.S.O., M.C., D.F.C.	Henry Fraser (Mechanic)	Martinsyde	275 h.p. Rolls-Royce Falcon
Capt. George Campbell Matthews	Srgt. Tom Kay (Mechanic)	Sopwith	350 h.p. Rolls-Royce Eagle 8
Capt. Ross Macpherson Smith Pilot.	Lieut. Keith M. Smith, R.A.F. (2nd Pilot) Sergt. J. M. Bennett Sergt. W. H. Shiers (Mechanics)	Vickers-Vimy	Two 350 h.p. Rolls-Royce Eagle 8
Lieut. Valdemar Rendle	Lieut. D. R. Williams (2nd Pilot) Capt. G. H. Wilkins (Navigator) Lieut. G H. Potts (Engineer)	Blackburn Kangaroo	Two 250 h.p. Rolls-Royce Twin Falcon
Lieut. Roger Douglas, M.C., D.C.M., A.F.C.	Lieut. J. S. L. Ross, A.F.C. (Navigator)	Alliance	450 h.p. Napier Lion

Captain Matthews, on a Sopwith, commenced his flight to Australia on an attempt to win the Prize of £10,000 offered by the Australian Government, on Tuesday, October 21st, 1919. Prior to the start, the machine was marked by the officials of the Royal Aero Club, and his official starting time was 11.44 a.m., taken by Mr. Stevenson of the Royal Aero Club.

PRESENTATION TO THE CLUB.

The following book has been presented to the Club by Major C. C. Turner :—"The Struggle in the Air, 1914-1918." By Major C. C. Turner. (Published by Edward Arnold.)

TO 98 SQUADRON.

Can any member of 98 Squadron, R.A.F., give any definite information concerning the fate of Capt. E. B. G. Morton, "A" Flight, 98 Squadron (formerly of 49 Squadron)?

On the afternoon of July 28th, 1918, Capt. Morton, who was flying a D.H.9 No. 1717, with Lieut. Frank Shaw, M.C., as his observer, left to carry out a special bombing raid, but his machine did not return. The formation was attacked by 15 enemy scouts shortly after crossing the line, and Capt. Morton's machine was observed flying at about 500 feet and doing a slow spiral into a small wood, or clearing between woods, S.W. of Dormans on the Marne. Probably in the southern half of a circle described at a radius of five miles with Dormans on the Marne as a centre. Probably near Soilly and probably within two miles of the south bank of the river. The observer who saw Capt. Morton's machine descending says that about 10 seconds after landing the machine burst into flames.

If there are any officers or men of 98 Squadron who can furnish any further particulars as to the subsequent fate of Capt. Morton such information will be most gratefully received by his parents. Any communications may be addressed to the Editor, at 175, Piccadilly, W 1.

POLICE PERMITS AND THE PARIS SHOW.

Those who have had experience of the interminable delays and annoyances of getting police permits in Paris and other foreign cities will be interested to hear that M. André Granet, the Commissaire Général of the Paris Aero Show, which opens on Dec. 19th, 1919, has made arrangements with the Prefect of Police that exhibitors at the Aero Show and technical journalists visiting the Exhibition will be given special facilities for obtaining the necessary police-passes.

It will be remembered that at the Amsterdam E.L.T.A. Exhibition, the Chief of the Police in Amsterdam very kindly installed a special police office in the Exhibition grounds at which foreign visitors to the Exhibition on business were able to obtain the necessary permits without more than a few minutes' delay. It has been found impossible to do precisely the same thing in the case of the Paris Aero Show, but the Committee of the Show has at any rate succeeded in obtaining a very considerable concession from the Prefect of Police in Paris

Instructions as to the method of utilising the facilities afforded can be obtained from the office of M André Granet at the Show itself.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In a leading article "Strasbourg" discusses the alleged energy and enterprise of the British Races, and draws therefrom a comforting conclusion.

In spite of that inverted attitude of mind which characterises so many of this writer's utterances, there is an appreciable groundwork of truth beneath his arguments.

The machine built and designed by the Sopwith Aviation and Engineering Company for the Australian flight is described and illustrated in this issue.

The Westland Aircraft Company's products form the subject of this week's instalment of "Modern British Aeroplanes."

An interesting instrument of American design which automatically stops the engine of an aeroplane in the event of the airscrew breaking is described on page 1472.

An important letter from Prof. G. H. Bryan, dealing with the status of the newly formed Institute of Aeronautical Engineers, is printed on page 1454.

ENERGY AND ENTERPRISE.

By "STRASBOURG."

There exists a legend to the effect that the British as a nation are generally afflicted with the qualities of energy and enterprise. This legend appears to be generally believed, not only by the British themselves but even more emphatically by a fair proportion of the world at large, and it must therefore be assumed that it has some foundation in fact.

Actually, if the facts are examined carefully, it will be found these two qualities—very carefully concealed—are largely present in the British races. A casual consideration of the habits of the Londoner in the passages of an Underground Railway station under normal conditions would suggest that, if the Electric Railway Companies provided plentiful sleeping accommodation at their stations, they might well dispense with one-half their train services. Similarly, the habits of the average London pedestrian suggests as a simple solution of the street traffic congestion troubles the slinging of hammocks between all lamp-posts.

On the other hand, the sight of these same sleep-walkers attempting to board an already full 'bus, or to insert themselves into a Tube carriage whose sides are already bulging from the excess pressure of their human content, appears entirely to contradict the conclusions to which the preceding phenomenon seem to point.

The recent railway strike again affords instances innumerable of those who found it practically impossible to reach their place of business punctually when transport was in normal order, but who turned up smiling and punctually when the whole transit arrangements were dislocated.

In exactly the same way the manners and customs of the Englishman in the wild and desolate ends of the earth, and those of that same Englishman after he has successfully made the desert to bloom like the rose and has thereby amassed a fortune sufficient to maintain him in comfort at Cheltenham, seem to suggest that the British generally are afflicted with a Jekyll-and-Hyde-like duality of character.

In this connection an early memory arises. My father was discussing, with the head of a well-known Glasgow engineering firm, the choice of a works whereat I was to be apprenticed. The Glasgow engineer offered introduction to a firm he considered suitable, but added, "If he were my son, I'd tear the seat out of his trousers and tell him not to come home till he'd got a job."

This touches the essential fact that the Britisher, confronted with a real difficulty, is spurred to action and is then capable of great things. An enterprise which calls for nothing more than a little industry and attention bores him stiff and he sleeps over it. This is the explanation of the fact that that same Englishman who habitually loses his way in an Underground Railway station invariably successfully locates the right platform at Liverpool Street, even if he has never seen the place before.

This peculiarity extends much farther than to the purely personal habits of the members of our race. It is strikingly reflected in the business methods of our great industrial corporations.

Thus the appalling inefficiency of our railway system is easily accounted for when it is remembered that even a British Government successfully improvised a reasonably adequate substitute during the late strike. It is obviously so simple an affair to run such a service that no one in this country will trouble to do it unless some serious and abnormal difficulties are introduced into the problem.

When, therefore, one comes to consider the present state of aerial transport in this country and the condition of the Aircraft Industry, one is forced to the conclusion that the operation of commercial air services as a paying proposition must be extraordinarily simple. If there were real difficulties in the way, British air would certainly be full of commercial aircraft.

So far, the only real efforts in aerial activity since the Armistice in this country have been devoted to the extraction from the pockets of the comfortably unemployed of excessive fees for conveying them in extreme discomfort to places they certainly have no reason to visit.

It is highly probable that even the apparent impossibility of this performance would scarcely have stimulated the activity which has actually been displayed had not a benevolent Government instituted a Department of Civil Aeronautics to make the process even more difficult.

This peculiarity of the British temperament shows up almost as clearly when one considers the future programme of certain of those firms who have during the late war taken up the work of aircraft manufacture.

The development of aircraft for serious transport work on a large scale presents quite a number of interesting problems—problems which involve the surmounting of numerous difficulties and the expenditure of much labour, material, and money upon experimental work.

Now, of the firms who have given any serious attention to aircraft, there are two main varieties. One is of the type of the large industrial corporation with immense resources and innumerable outlets for its operations who have taken up aircraft work as a war-time side-line. To this class the continuance of experimental work presents no real difficulty. They already own the necessary plant, tools, staff, and personnel to carry out such work, and they can well afford to invest the necessary cash in running their experimental work against the time when an ample return will arrive almost automatically.

The other main class consists of those few pioneers who spent their all in experimental work before the war, have been deprived—*via* the Excess Profits Duty—of any reasonable return during its continuance, and who, to all appearances, have no earthly chance of successfully bearing the burden of the next few years.

The first class, being British, have mostly decided that it is too easy, and are very generally shutting down their aircraft departments completely.

The second class—equally British—without exception appear determined to carry on.

Fortunately the immediate difficulties in their way seem to be sufficient to ensure a really fine display of energy on their part, and therefore there is no real fear for the future of the British Aircraft Industry.

AN AERONAUTICAL MOLESWORTH.

Handbook of Modern Aeronautics. By Arthur W. Judge, A.F.R.Ae.S. (The Library Press, Limited, London. Price 30s. net.)

Mr. A. W. Judge has already contributed a number of very useful compilations to the technical literature of aviation. In those books he has shown a capacity for collecting into an easily accessible form aeronautical data from all the ends of the earth.

In a "Handbook of Modern Aeronautics" Mr. Judge has collected a vast amount of information relating to aeronautical engineering into a kind of "Super-Molesworth" for the aeroplane designer, consisting of 1,040 pages, containing 350 tables and nearly as many illustrations.

The first two sections, totalling 110 pages, are devoted entirely to tables of weights and measures, conversion tables, logarithms, squares and square-roots, etc., screw threads, wire gauges, and like painful necessities of such a work.

Thereafter the book gets to rather closer grips with its subject and deals with the weights, the properties, and the treatment of materials used in aircraft manufacture, the theory of the strength of materials, and thence, with an interjected interlude dealing with mathematical rules and mechanics, to aerodynamics, the design of aeroplanes, the calculation of aeroplane performance, stability and control of aeroplanes, aeronautical instruments, meteorology, aerial navigation, aircraft engines, airscrews, with a final chapter on flying-boats and seaplanes.

The amount of information which it contains is enormous, and the greater part of the information is useful information. It must be regarded as a monument to Mr. Judge's industry in collecting and tabulating facts and to his judgment in choosing the facts to tabulate.

Upon the whole, however, it may be doubted whether Mr. Judge and his publishers have been well advised in issuing the volume at this date.

During the five years of war technical aeronautical information was necessarily kept secret, and most of the contributions to the art are not yet available for publication.

Hence Mr. Judge's immense labour has produced a tome which contains practically no aerodynamical statistics which had not been published before the outbreak of war. For instance, the latest N.P.L. wing section test recorded is that of R.A.F.6—a section for which no modern designer is ever likely to have any use.

In a similar way the method outlined for determining wing stresses in aeroplanes is that published by the R.A.F. circa 1913, and long since abandoned in favour of more accurate methods by practically all British designers.

The labour of compiling such a book and the time occupied in printing and in checking proofs makes it impossible to include information of very recent date, more particularly in a first edition, but in this case a delay of a few months or perhaps a year would have made a great difference.

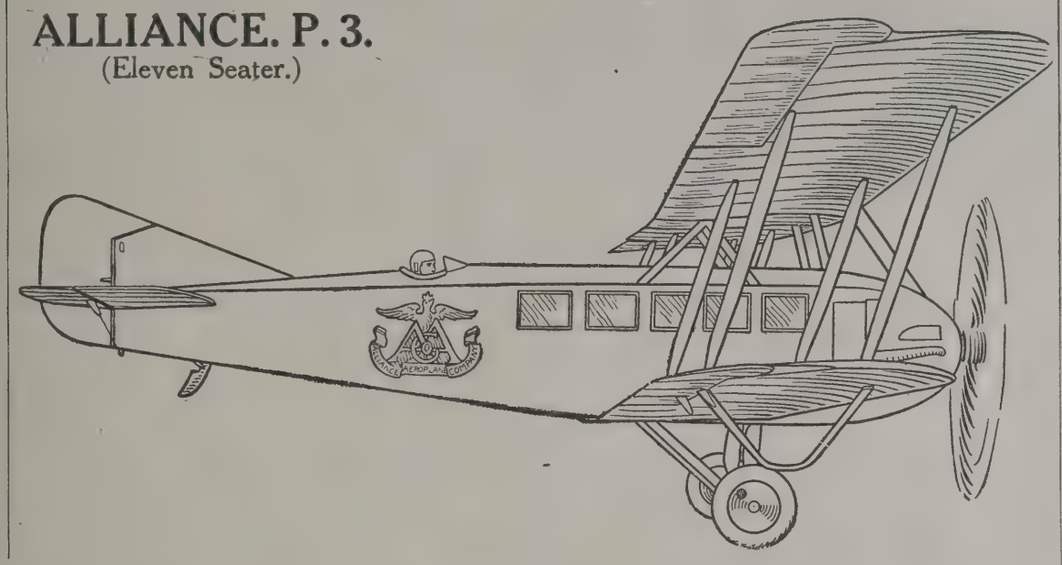
One can entirely sympathise with Mr. Judge's desire to put the work on the market and establish his footing before anyone else compiled a similar volume, and one can quite appreciate the trial to his patience which would be involved in waiting for the Air Ministry to allow the publication of modern technical data; but the result is that in many respects the book is five years out of date—a rather serious matter in this case.

For the rest the book is well and clearly printed, and on the whole well arranged. A number of typographical errors have escaped the notice of the proof-readers—an almost inevitable occurrence in the first edition of such a work—but in the majority of cases the errors are obvious and are not liable to mislead any intelligent reader.

Altogether the book should prove extremely useful to all aeronautical engineers, and is well worth its price.

LIBERTY ENGINES.

The Liberty Engine and Foundry Company, Ltd., of Seymour, Connecticut, U.S.A., announce that they have completed their plans for the manufacture of Liberty engines for commercial purposes and that orders for early delivery of these engines can now be accepted by them.



A NEAT JOB.—The business end of the B.A.T. Sporting two-seater (170 h.p. "Wasp" A.B.C. engine).

Longest Commercial Flight in the World

LONDON TO MADRID NON-STOP—

900 MILES IN $7\frac{3}{4}$ HOURS

ALLIANCE. P. 3.
(Eleven Seater.)

THE above is a sister machine to the one which flew to Madrid. These machines have been adopted by Messrs. Waring & Gillow for their Intercommunication Services between their various Houses in London, Paris, Brussels, Madrid, Buenos Aires, etc. The first flight between London and Madrid was made on July 31st :—a distance of 900 miles in $7\frac{3}{4}$ hours. It is to be noted that the actual fuel cost on this flight was $7\frac{1}{4}$d. a mile.

On a service of this length these machines are capable of carrying a TON of goods or mails or TEN passengers, in addition to the pilot and fuel for the non-stop flight. The passengers are very comfortably seated in a totally enclosed cabin, free from noise and draughts and provided with ample window area, affording a clear view of the country below.

For terms and particulars of this and other types, and appointments for demonstrations apply to :—

THE SOPWITH "WALLABY."

The Sopwith "Wallaby" has been designed primarily to attempt the Australian flight and is a two-seater single-engined tractor biplane. In general lay-out it resembles the Sopwith "Atlantic" machine, but it embodies many improvements and modifications, which suggested themselves as a result of the first attempt at direct flight across the Atlantic.

The fuselage is constructed in the ordinary way and carries in its nose a 375 h.p. Rolls-Royce "Eagle" Mark VIII engine. The main petrol tanks are carried in rear of the engine and extend aft to a point directly under the trailing edges of the main planes. A gravity petrol tank and water tank are carried in the centre section. The gravity tank is fitted with a flow-meter, which indicates the consumption of petrol per hour.

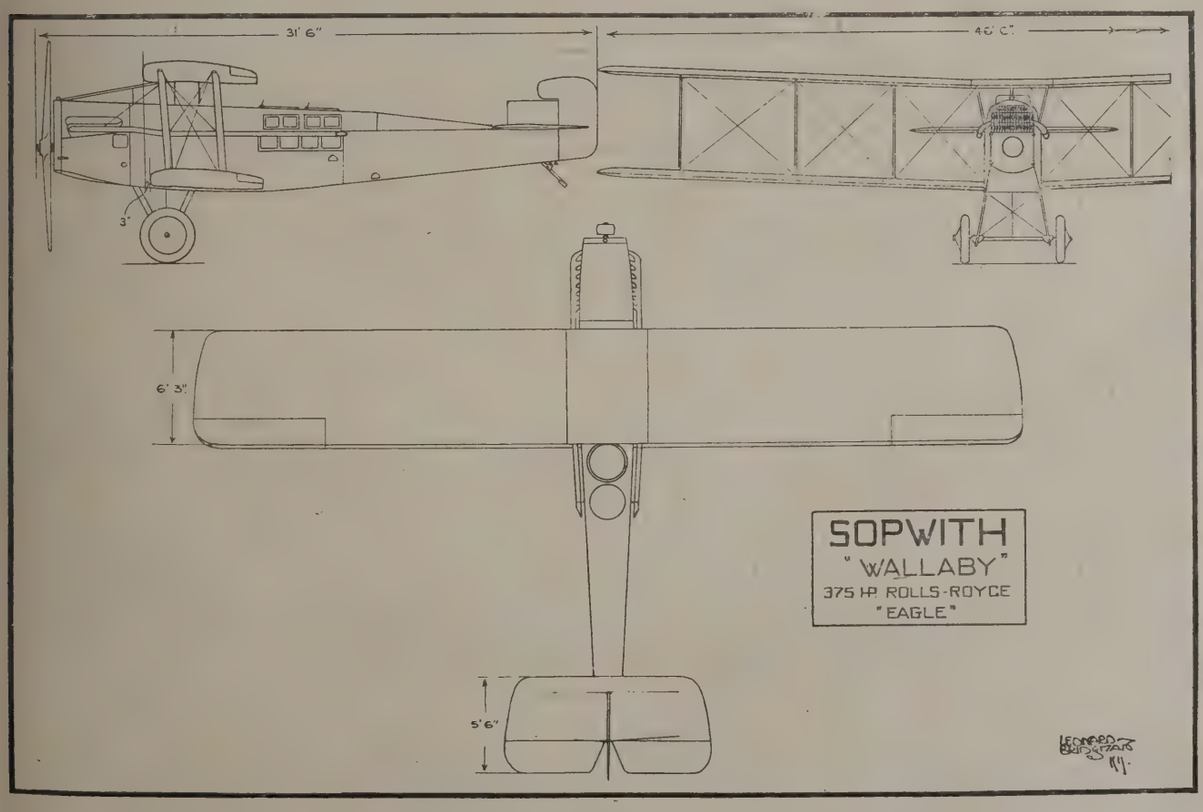
Side View of the Sopwith "Wallaby" (378 h.p. Rolls-Royce engine).

The pilot's and navigator's cockpit is fitted with Triplex side windows and a floor window in front of the pilot, who sits in front. Normally, the seats allow the crew to sit in the usual position with their heads just clear of the cockpit, but provision is made by means of which the cockpit may be converted into an enclosed cabin.

The seats are fitted with clips which allow them both to drop about a foot, and sliding doors are pulled across the openings. Four of the side windows are made to open, and a pipe running from the front of the radiator supplies fresh air to the crew.

Dual control is fitted throughout, and the pilot has two rudder-bars, one above the other, for the two seat positions. A tail-plane operating gear is fitted, the control wheel being situated on the left side in a position which is convenient to both pilot and navigator. The cockpit arrangements have been beautifully worked out and are fitted with every convenience for the crew.

The pilot has a system of pull-out tables for charts, etc., together with slots and receptacles to take parallel rulers and instruments. The circular opening for the pilot's head is fitted with an aluminium beading which is graduated off into degrees for use in conjunction with a sextant. In rear of the navigator are cupboards and lockers for carrying foodstuffs and any other odds and ends necessary for the journey.



The fuselage fairing tapers down to the small rectangular fin carried above the tail-plane to which is hinged a balanced rudder.

The main planes of 46 ft. 6 in. span are staggered forward three inches and have three sets of struts on either side of the fuselage. Unbalanced ailerons are fitted to all four planes.

The undercarriage is an ordinary steel-tube Vee-type affair and carries two large size Palmer Aero wheels suspended in the usual Sopwith manner, that is, on a divided axle which is hinged in the centre to the cross-tubes at the apices of the Vees, and slung on shock absorbers in the usual manner.

The whole machine is a very clean job and is finished off in the typical Sopwith style, which strikes one not only as being thorough, but carefully thought out and well finished.

The machine handles very well in the air, and the fact that it has a ratio of useful load to total weight of 46.5 per cent. shows that it possesses the efficiency that one might connect with the names "Sopwith–Rolls-Royce."

SPECIFICATION.

Type of machine.....
Single-engined tractor biplane
Name .....Sopwith "Wallaby"
Purpose for which intended.....
Australian flight, passenger carrying, etc.
Span .....46 ft. 6 in.
Length .....31 ft. 6 in.
Chord .....6 ft. 3 in.
Gap .....6 ft.
Total surface .....550 sq. ft.
Span of tail .....11 ft. 6 in.
Chord of tail .....5 ft. 5 in.
Engine type and h.p.....
Rolls-Royce "Eagle" Mark VIII 375-h.p.
Weight (empty) .....2,780 lb.
Weight (fully loaded) .....5,200 lb.
Useful load .....2,420 lb.
Ratio of useful load to total weight .....46.5 per cent.
Load per sq. ft. (fully loaded) .....9.45 lb.
Load per sq. ft. (light) .....5.05 lb.

THE INSTITUTE OF AERONAUTICAL ENGINEERS.

The following is a copy of a letter addressed to a membe of the Council of the Royal Aeronautical Society by Professor G. H. Bryan, F.R.S., in reply, apparently, to an objection to the formation of the Institute of Aeronautical Engineers :—

North Wales, Oct. 8th, 1919.

My dear Sir,—I have to thank you for yours of the 6th inst., and while regretting that such is the case, I can only say that I fully anticipated opposition on the part of the Royal Aeronautical Society towards the proposed Institution of Aeronautical Engineers.

My reason for wishing to take this movement up is that I find that a duplication of societies exists in nearly every other branch of science, even where the subject-matter is far more limited in scope than it is in aeronautics, and I feel the time has come for extending the practice to the interests of aerial navigation.

We have a Chemical Society and an Institute of Chemistry, a London Mathematical Society and a Mathematical Association, and I could draw up a long list of other cases in none of which does any clashing of interests exist. In the mathematical case the "Association" is entirely devoted to the interests of teachers in schools, most of whom would never think of joining the London Society, although many of the leading men in that subject belong to both bodies. But I have been partly guided in my decision by the recent proposal to found an Institute of Physics, although I should have considered this to be the case in which duplication was least necessary and the requirement adequately met by the London Physical Society.

The present requirements of aerial navigation cover a far wider field of activity, both theoretical and practical, than falls within the scope of any of these other "societies" and "institutions," and I do not consider that it is any longer possible for a single body to attempt to cope with all these varied interests without weakening itself by attempting too much.

Personally I consider that the foundation of such an institution devoted mainly to the interests of mechanics and pilots, and holding examinations similar to those of the Institute of Chemistry, is calculated to strengthen instead of weaken the position of the Royal Aeronautical Society as the paramount authority on scientific and technical matters connected with aviation. The circumstance that the parent society has so recently acquired the title "Royal" seems a fitting opportunity for the change.

I think you will see from this that I have acted entirely on my own responsibility in taking up the I.Ae.E., and have not been influenced in any way by personal considerations. I am not concerned with the motives which Captain Shaw had in starting the Institute, but I consider it to be a move in the right direction which is bound to meet with some opposition at first, but which will find its proper level after a short time.

It is partly for this reason, and partly because for the next year I have an opportunity of interesting myself in aeronautical matters such as I have not previously enjoyed, and which may not continue, that I accepted Captain Shaw's nomination to an office which will bring me into close touch with the whole working of the movement.

I am sorry you wrote so quickly, for I was just on the point of writing in this spirit to the Royal Aeronautical Society when yours arrived, and I should have been better pleased had I been first in the field in approaching its Council.

In conclusion I can only repeat that I have given the matter very careful consideration before taking this step. If it involves any risks they are mere trifles in comparison with the risks that have been incurred in building up modern aviation.

Whether you are right in thinking this Institute wholly unnecessary or I am right in thinking that it will ultimately prove a valuable auxiliary to the Royal Aeronautical Society, time will show. But it has been my experience that where my opinions differed from those of other people they have ultimately, though not immediately, proved to be right.

I am keeping a copy of this letter which I wish to make use of for circulation, and I shall be exceedingly grateful if you will submit it to the Council of the Royal Aeronautical Society and make any further use of it in showing it to friends that you think fit.

With kind regards, yours sincerely,

(Signed) G. H. BRYAN.

[It will be remembered that Professor Bryan is the leading authority upon the mathematics of aeroplane stability in this country.

Professor Bryan was invited to become the first President of the Institute of Aeronautical Engineers and he has accepted that invitation.—Ed.]

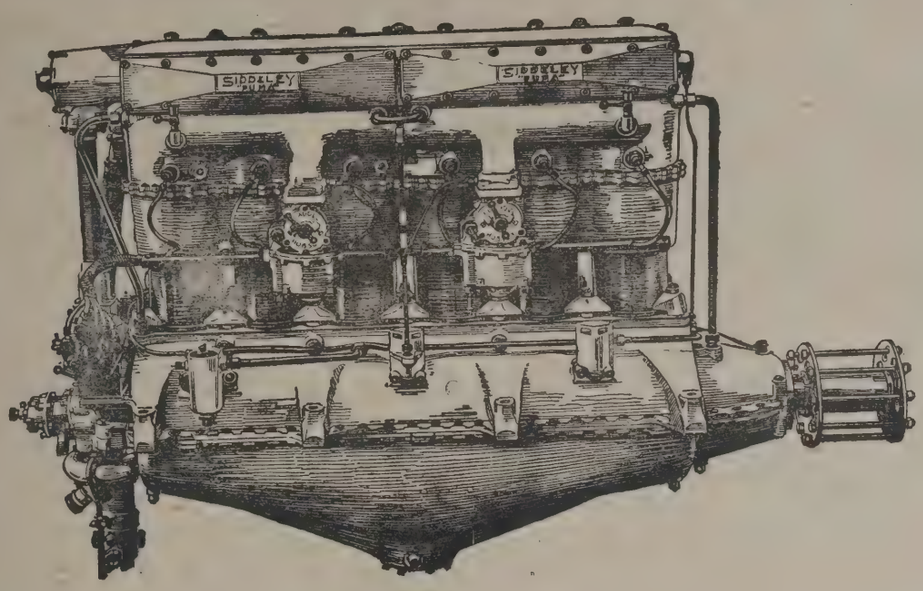
THE GOVERNMENT AEROPLANE COMPETITION.

Apropos the ridiculous rules for the Government competition for commercial aeroplanes, it has been computed by an authority with a wide acquaintance with practical aeroplane testing that a scoring sheet about 48 in. by 60 in. will be required to record the marks for each machine entered, and that at least two months will be required to test each machine.

BRITISH AVIETTES.

Apropos the revival of interest in man-propelled aeroplanes, it is of interest to hear that certain well-known and experienced British aeronautical engineers are concerning themselves with the subject.

Particular interest attaches to certain experiments with a machine of the flapping-wing type, which, although it has not yet flown, has given very promising results which show that the flapping wing is by no means a despicable propulsive agent.



BARIMAR, LTD., AT OLYMPIA.

The stand of Barimar, Ltd., scientific welding engineers, at the Olympia Motor Show affords conspicuous evidence of the enterprise of this company in the field of metal-fusion.

Immense progress has been made within the last five years, and, indeed, there has been such a perfecting of the processes that what was impossible years ago is now a matter of everyday occurrence.

Barimar is this year showing machinery which is now being pressed into use by the firm in connection with the efficient handling of repair work. In this, Barimar is believed to be the only firm in the universe that has so far taken advantage of the new apparatus, by means of which scientists are bringing to the aid of man unerring instruments calculated to be of the greatest possible use.

Barimar will show some excellent samples of welded metals of every description. In addition, there will be numerous photographs of repair jobs put in hand for customers in all parts of the kingdom, and an adequate display of new radiators and general sheet-metal work, together with Barimar steel domed mudguards and accessories, and cast aluminium number-plates. They will also show examples of Barimar machine work, such as crankshafts, valves, pistons, and other replacement parts.

The **SIDDELEY** AIRCRAFT ENGINE

The Folkestone to Cologne Air Mail

THE Aerial Mail Service from Folkestone to Cologne (recently discontinued) was carried out by two squadrons of the Royal Air Force, one of which was equipped with D.H.9 aeroplanes fitted with 230 h.p. Siddeley Aircraft Engines. The journey was performed in an average of 3 hours 22 minutes. The average weight of mail carried per journey was over 160 pounds.

That the service was efficient is proved by the fact that during the week ended August 16th over 7,000 pounds of postal matter was safely carried from this country to the troops in Germany. Of 45 journeys commenced only one was not completed.

MODERN BRITISH AEROPLANES.

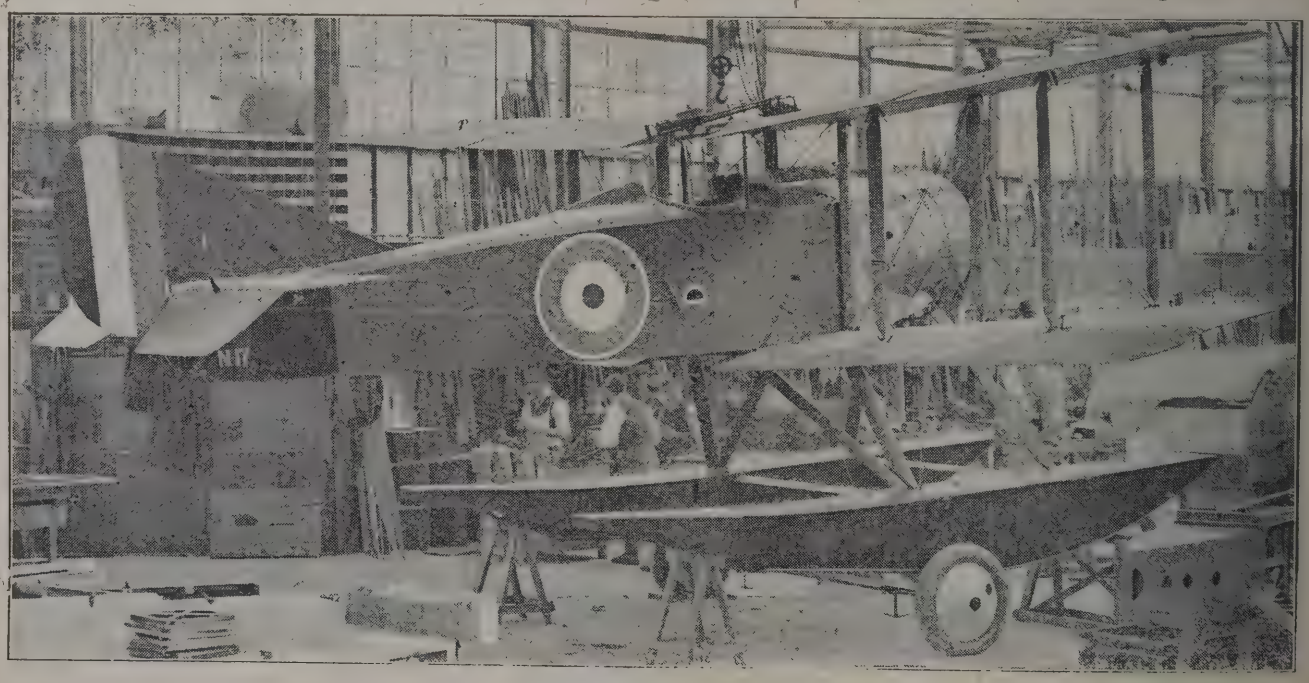
XX.—The Westland Aircraft Works.

The Westland Folding Seaplane N.16 (150 h.p. B.R.1. Engine).

The Westland Aircraft Works is the aircraft branch of Petters, Ltd., the famous engineering firm of Yeovil, Somerset, and is under the management of Mr. R. A. Bruce, M.I.M.E., A.M.I.C.E., M.Sc., formerly of the British and Colonial Aeroplane Co., Ltd., and previously connected with the Brennan torpedo and the Brennan Gyroscopic Monorail.

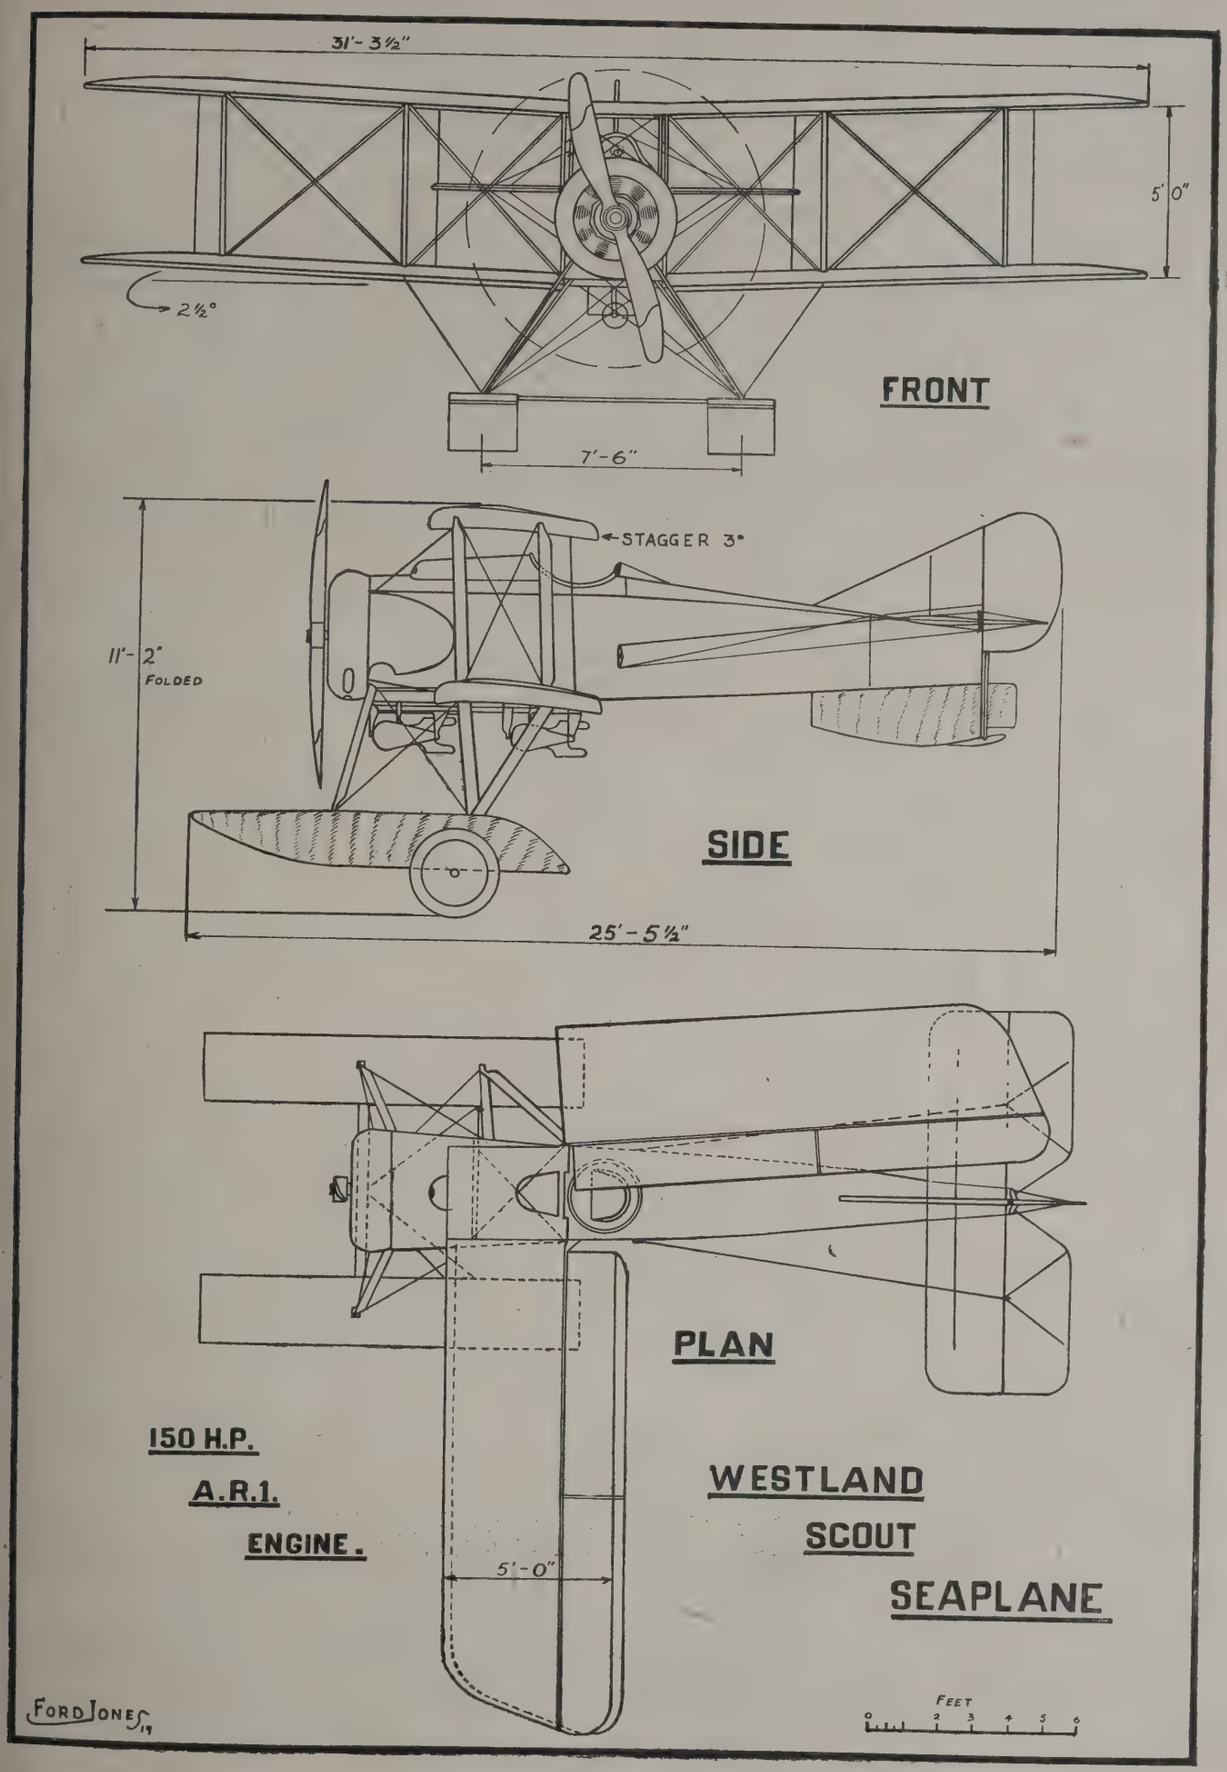
During the period of hostilities the firm built numerous machines to the specifications of the Air Department, Admiralty, and the Air Ministry, and have in addition produced several interesting machines of their own design.

THE WESTLAND SEAPLANE N.16.

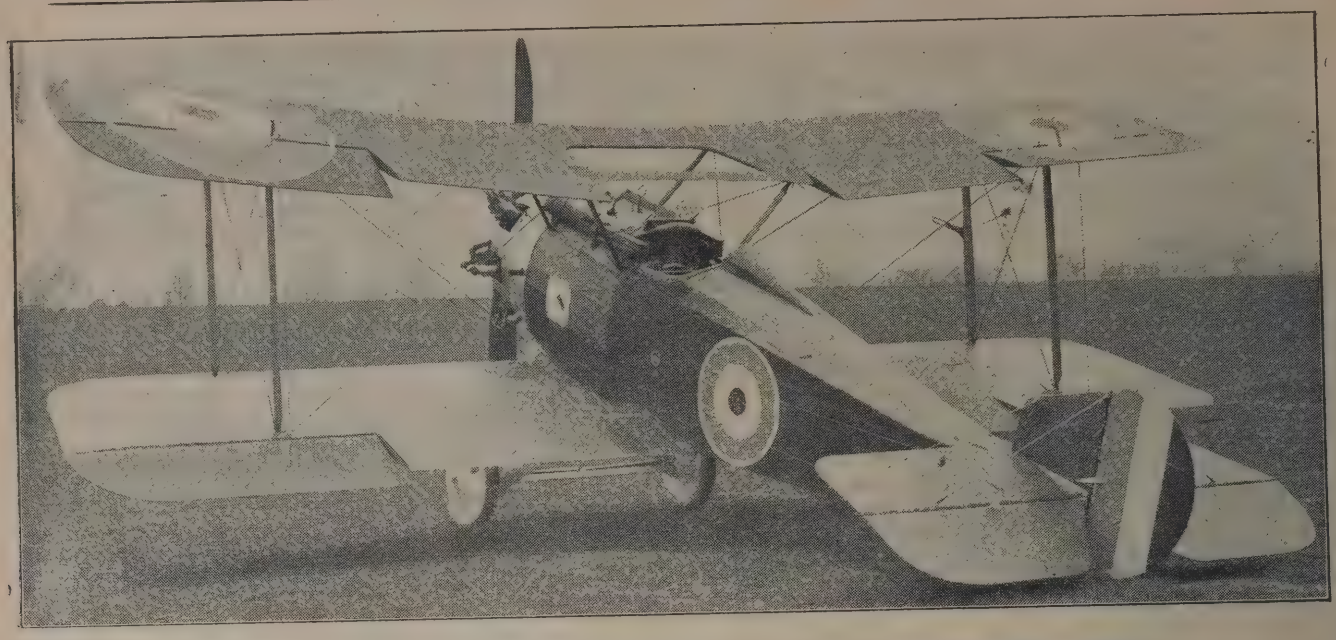


The Westland seaplane N16 is a small single-seater seaplane fitted with two pontoon floats and a large single tail float, and was designed as a fighter and light bomber for use from seaplane carrier ships.

The fuselage is of normal type, with a pronounced bump in the fairway ahead of the pilot's seat. In this bump is fitted a fixed synchronised Vickers gun.



In order to reduce the space for stowage on board ship, the main planes are made to fold. Both upper and lower planes are of equal span, and two sets of interplane struts are fitted on each side.



The wings are fitted with trailing edge flaps along the whole span, giving a variable camber, which is controlled from the pilot's seat.

Ailerons are fitted to both upper and lower wings.

The Westland Seaplane N.17. Note the curious form of main float and the absence of a tail float. Otherwise this machine is identical with N.16.

The Westland N17 seaplane is exactly the same except that the main floats are increased in length, slightly turned up at the rear, and no tail float is fitted.

SPECIFICATION.

Type of machine	Single-seater Tractor Seaplane Scout.
Name of type of machine	Westland Seaplane N. 16.
Purpose for which intended	Fighter Scout, capable of getting off deck of ships.
Span	31 ft. 3⅜ in.
Overall length, fuselage horizontal	25 ft. 3⅛ in.
Overall length resting on tail float	26 ft. 5⅛ in.
Maximum height resting on tail float	11 ft. 2 in.
Chord	5 ft.
Total surface of wings, includes centre sections	278 sq. ft.
Span of tail	11 ft.
Area of tail plane	24.5 sq. ft.
Total area of tail, incldg. elevator	42 sq. ft.
Area of elevators	17.5 sq. ft.
Area of rudder	7.5 sq. ft.
Area of fin	6.8 sq. ft.
Area of each outer aileron	9.9 sq. ft.
Total area of ailerons	39.6 sq. ft.
Maximum cross section of body	10¾ sq. ft.
Horizontal area of body	44 sq. ft.
Vertical area of body	55 sq. ft.
Engine type and h.p.	Air-cooled rotary A.R. 1; 150 b.h.p.; 1,240 r.p.m.
Airscrew, diam., pitch and revs.	Diam. 2,650 mm., pitch 2,650 mm., 1,240 r.p.m.
Wing section	R.A.F. 14. Variable camber device.
Weight of machine empty, without fuel and oil	1,460 lb.
Weight of machine empty, but with 268 lbs. for fuel and oil	1,728 lb.
Load per sq. ft.	7.7 lb. sq. ft. fully loaded.
Weight per h.p.	14.2 lb.
Tank capacity in hours	2½—3 approx. ground level.
Tank capacity in gallons	Petrol 30 galls.; oil 5 galls.
PERFORMANCE—	
Speed low down	108 m.p.h.
Landing speed	50 m.p.h. with no flaps; 45 m.p.h. with flaps.
Climb—	
To 5,000 feet	10 minutes.
To 10,000 feet	28 minutes.
Disposable load apart from load 405 lbs.	Pilot 180 lbs.; Bombs & Gear 150lb.; Gun and 250 rounds, 60 lbs.; Sundries, 15 lbs.
Total weight of machine loaded	2,133 lbs.

Side View of the Westland "Wagtail" Single-seat Fighter.

THE WESTLAND "WAGTAIL."

The Westland "Wagtail" was designed in answer to a general demand for a fast, quick-climbing and general ability single-seater fighter.

It conforms in general arrangement with most other machines of this type.

The pilot's view is very good both upward and downward, more than half the centre section being left open. Main planes of equal span are fitted, the

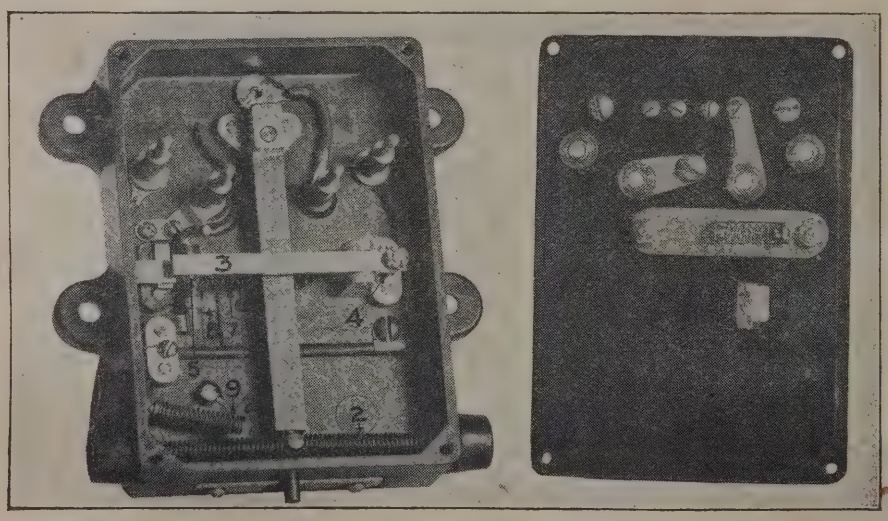
Overall length	18 ft. 11 in.
Maximum height	8 ft.
Chord	4 ft. 6 in.
Total surface of wings	190 sq. ft.
Span of tail	7 ft. 10¾ in.
Total area of tail, inclg. elevators	25 sq. ft.
Area of elevators	9.5 sq. ft.
Area of rudder	4.4 sq. ft.
Area of fin	2 1 sq. ft.
Area of each aileron	6 sq. ft.
Total area of ailerons	24 sq. ft.
Maximum cross section of body	7.1 sq. ft.
Horizontal area of body	29.3 sq. ft.
Vertical area of body	36.5 sq. ft.
Engine type and h.p.	173 b.h.p. "Wasp" Fixed Radial.
Airscrew, diam., pitch and revs.	Pitch 2070 mm., dia. 2590 mm., revs. 1,900.
Weight of machine empty	965 lbs. (including 219 lbs for fuel and oil).
Weight of machine empty (without fuel and oil)	746 lbs.
Load per sq. ft.	7 lbs.
Weight per h.p.	7.7 lbs.
Tank capacity in hours	2½ hours at 15,000 ft.
Tank capacity in gallons	Petrol 26 galls.; oil 3 galls.
PERFORMANCE—	
Speed at 10,000 feet	125 m.p.h.
Landing speed	50 m.p.h.
Climb—	
To 5,000 feet	3½ minutes.
To 10,000 feet	7½ minutes.
To 17,000 feet	17 minutes.
Disposable load apart from fuel, 365 lbs.	Pilot 180 lbs. Two guns, gear and 1,000 rounds 160lbs. Oxygen 25 lbs.
Total weight of machine loaded	1,330 lbs.

The Westland "Limousine" (Rolls-Royce "Falcon") in the Air.

In addition to the machine described above the Westland Aircraft Works have designed and built the Westland "Weasel," a high-performance single-seater on somewhat similar lines to the "Wagtail," but fitted with the 320-h.p. "Dragonfly" A.B.C. engine, and the Westland "Limousine" four-seater commercial machine.



The "Weasel" is still undergoing tests by the Royal Air Force, and no details of the machine are as yet available.

The "Limousine" was fully described in The Aeroplane of August 13th last.

AN AMERICAN SAFETY DEVICE.

The result of an airscrew breaking either in flight, getting off, or landing is usually in itself unimportant. The indirect effect of the engine to which it is attached racing with the badly out of balance fragments of the damaged airscrew attached may range from a wrecked engine to a complete crash followed by fire.

Effectively to prevent damage from such an event it is necessary to cut off the engine-power before the engine actually races, which means that the engine must be stopped almost immediately. Switching off the engine by hand is rarely a sufficiently rapid process, as there is a definite time lag between the actual breakage, the pilot's recognition of the cause or seat of the trouble, and the physical action of switching off, and in this interval very considerable damage may occur.

The Internal Economy Device of the Douglas Interrupter.

The Douglas Interrupter, devised by Mr. Theodore Douglas, of the Duplex Engine Governor of Brooklyn, N.Y., was developed, under the auspices of the United States Advisory Committee for Aeronautics, to provide against accidents of this kind by automatically cutting off the ignition of an engine immediately on the production of any abnormal vibration occurring.

The design of the instrument is extremely simple, and it may be briefly described as consisting of a suitably pivoted metal bar, so mounted as to swing in a plane transverse to the axis of rotation of the propeller. By means of tension springs 2—2 the free movement of this bar is confined, under normal conditions, to a very limited arc in its plane of movement. The amplitude of this movement is determined by the weight of the bar, the intensity and frequency of the transverse vibrations

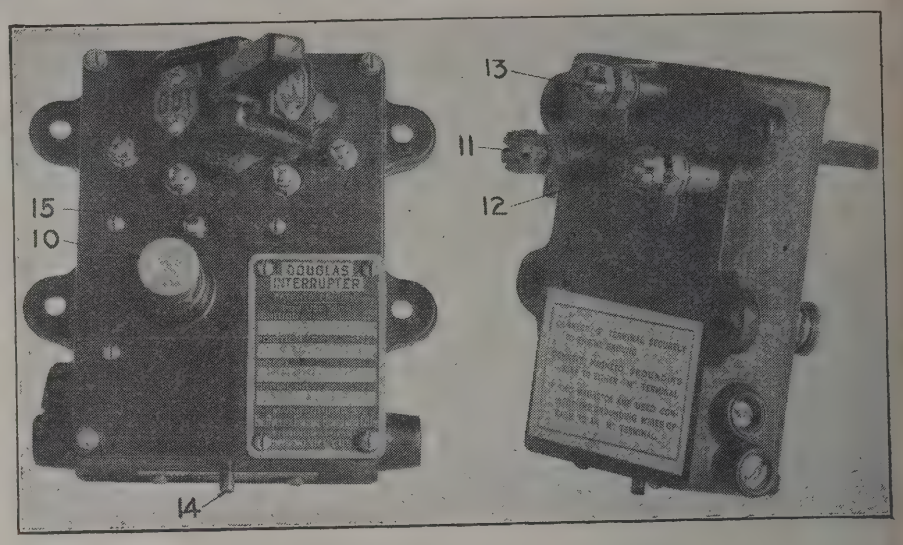
of the engine, and the strength of the springs. The extended end of the trigger 3 is constantly pressed towards the floor of the instrument by the compression spring 4, and engages the latch 5. On the under side of the trigger 3 there is an inclined surface 6, by which the trigger is raised. A ball-pointed hardened steel screw is fitted into the bar directly beneath the trigger, and engages an inclined surface and thus lifts the trigger when the swing of the bar is sufficient. When the trigger is lifted the latch 5, held under tension by the spring 7, is released and moves out of engagement with the trigger. The cam 8 is for the resetting of the latch through rotating it back into position by means of the push-button 10, from the outside of the instrument.

The compression spring 9, presenting an unbalanced force, is designed to prevent the bar from disengaging the latch 5 as a result of cylinder misses coinciding with bad vibration periods of the engine, etc., thus increasing the amplitude of the swing of the bar through synchronism, or from lateral shocks to which the plane may be subjected in landing. An intense oscillating shock transverse to the axis of the engine, such as an unbalanced engine-propeller torque reaction resulting from the breaking of a propeller at speed, are the types of shock from which the instrument is designed to operate, and to which it will immediately respond. Under such conditions the bar will swing through its full amplitude, raise the trigger, which releases the latch, and thus interrupts the ignition by earthing the magnetos. From the interrupter terminals 11 and 12 wires are connected to the earth terminals of the magnetos, and from the terminal 13 of the interrupter a wire is connected to the engine earth. On the disengagement of the latch 5 a triple contact is made between the interrupter terminals 11, 12, and 13.



Provision is made for testing by the pilot before each flight of the operation of the interrupter. Such a test can be conducted in ten seconds. The handle 14, which projects through a slot in the end of the instrument, is pushed gently to the left until the red spot 15 of the tell-tale, which bears a luminous cross for night flying, appears. Before the engine stops the instrument may be re-set by pressing down on the button 10 until the red spot of the tell-tale disappears. Should the engine not stop it would indicate that either the interrupter switch is in the wrong position or that its wiring system, etc., is defective.

A manually operated switch is provided with each instrument, by which the interrupter may be thrown into and out of the grounding circuit as desired.

Interrupters are furnished of two general types, maker and breaker instruments, and in several models to best suit various engine and aeroplane conditions.

MAKER-instruments, such as the one just described, are intended for magneto-ignition engines, in which cases there is no flow of current through the instrument, excepting at the moment of interrupting the ignition.

BREAKER-instruments are intended for Liberty engines using the Delco system, where the flow of the current is constantly through the instrument, and where two separate current channels are provided, because of the double distributor system used on these engines. The interruption of the ignition results from breaking these channels.

The Exterior of the Douglas Interrupter.

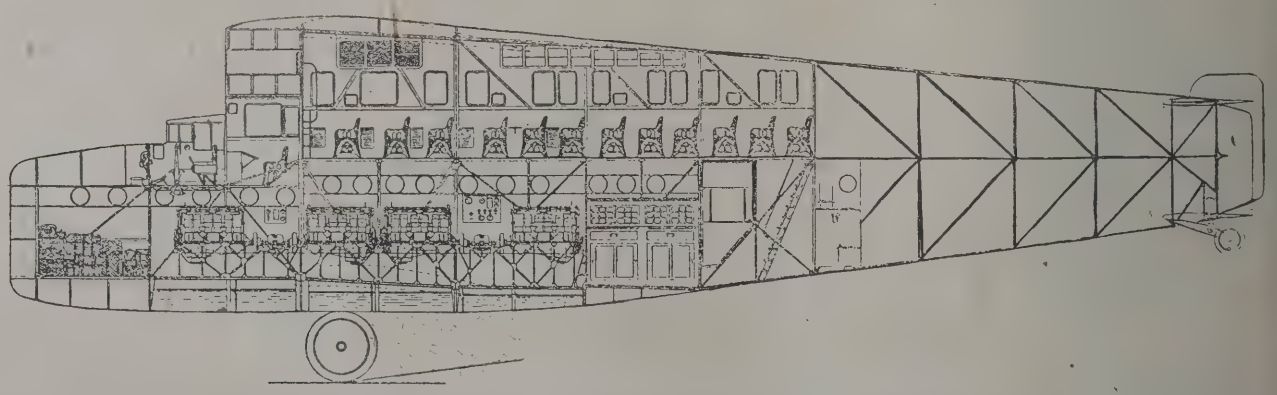
The interrupter is manufactured in five models to suit the ignition system employed and the requirements of the engine installation.

When the engine is on the wings the interrupter is mounted on a weather-proof casing attached to an engine-bearer.

The weight of the instrument is under ten ounces.

American naval pilots who have flown interrupter-equipped machines for over six months state that during that period the ignition of the Liberty engines has at no time been adversely affected. The operation of the instrument has been most satisfactory in every way, and has fully met all of the claims which have been made for it.

Various tests of the interrupter made by the United States Navy Department have shown in general the following results :—



(a) As nearly as it has been possible to determine the instrument will operate within one complete revolution of the engine following the propeller breakage, or within a time interval of one twenty-third of a second.

(b) It may be depended upon to do this every time that such a breakage occurs, as shown by tests in the air and on the ground.

(c) It will not interfere with the efficiency of the ignition system, nor has it caused complications therein of any kind.

(d) The electrical resistance of the interrupter on Liberty engines has been determined by a representative of the Delco Company as being less than 0.03 to 0.05 ohm, representing a loss of potential in the primary current to the distributors of 0.33 to 0.55 of one per cent., a value which is entirely negligible.

The design, workmanship, and materials employed in the construction of the interrupter are of high quality. The latches and triggers of the instruments are of hardened steel heavily silver-plated to minimise electrical resistance, to provide better contacts, and to prevent corrosion. Other contact parts are of hard brass silver- or nickel-plated. All of the springs employed are of phosphor-bronze. The electrical connections between the instrument base and its cover are by means of substantial screws which act not only as binding posts, but as attachment members holding the cover in place. These are all protected by castelled nuts and cotter pins. Insulating parts consist of bakelite castings.

THE AIRCO FLYING BOATS AND SEAPLANES.

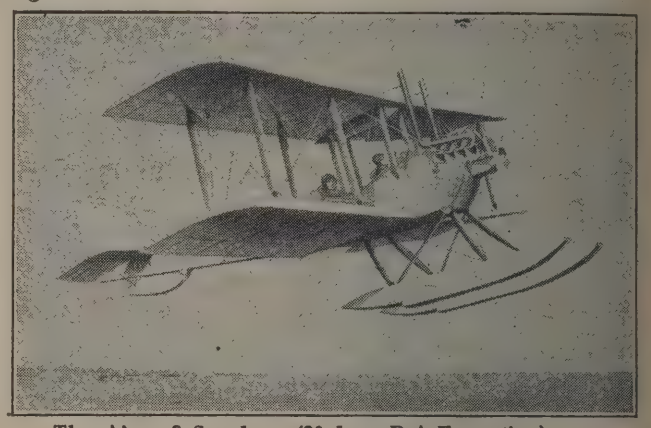
The Airco 23 Flying Boat (450 h.p. Napier engine).

As far back as 1912 the Aircraft Manufacturing Company was delivering Henri and Maurice Farman seaplanes to the British Government and was, therefore, among the pioneers of British seaplane construction. The Company can claim, also, to be the earliest exponents of launching torpedoes from seaplanes and flying-boats.

When the war came, the Company, in collaboration with Commander J. C. Porte, carried out the detail designs and construction of the famous Porte flying-boat. This boat—the first large development of the original American or Curtiss machine—was at that time the biggest flying-boat in the world.

After the production of the first of these machines—officially known in the Services as the Porte "Baby" and the forerunner in this country of all big aeroplanes and seaplanes—orders were received for a large number, which necessitated the provision of a seaplane base. Whereupon the Company acquired the works at Southampton and Hampton Wick of Messrs. May, Harden, and May.

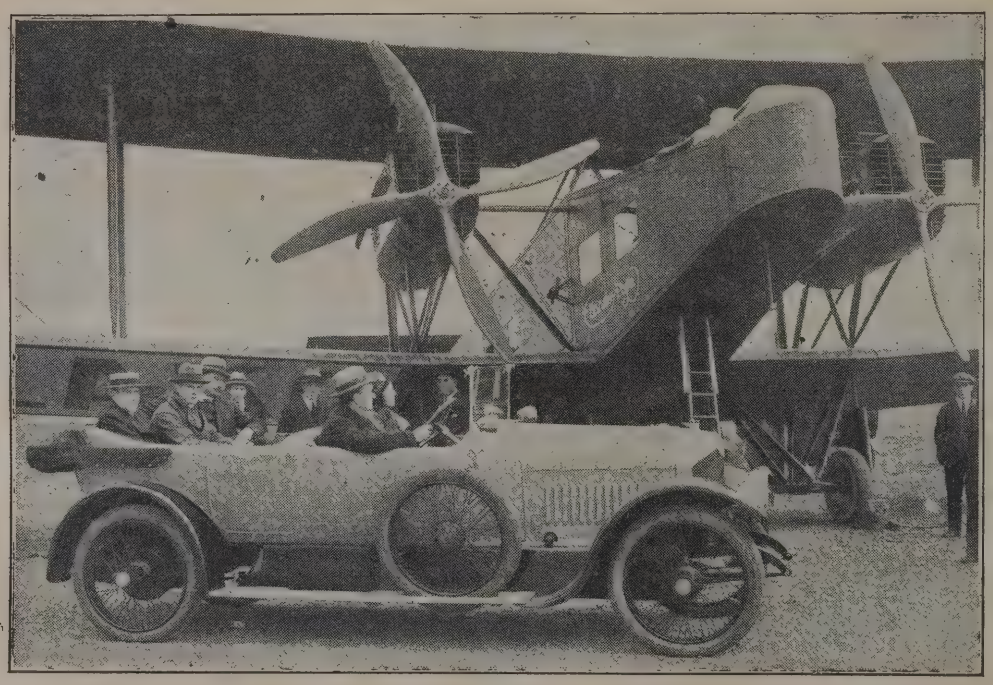
The hulls of the first experimental Porte boats were built at the works at Southampton, and the wing construction, engine installation, and controls made and finished at the Company's works at Hendon. The machine itself was designed in the seaplane drawing office of the Aircraft Manufacturing Company, under the supervision of Commander Porte.



Orders were received subsequently for a number of F.2A. flying-boats, which were direct developments of the Porte boat, a good deal of detail design and refinement being left to the seaplane drawing office. The result, indeed, of the Company's acquiring this seaplane base was that, in addition to designing the hulls for the Company's own productions, the hulls of many types of flying-boats, experimental or otherwise—with the exception of those designed by Commander Porte, at Felixstowe—emanated either from Southampton or Hampton Wick.

Where the special skill lies in designing a flying-boat hull is in the knowledge of how to make it strong enough and, at the same time, to keep the weight down to a minimum; and in this regard it is interesting to note that each hull produced by the firm has been lighter than its predecessor, whilst actually possessing an increased strength. Each, though beautifully streamlined, thereby reducing head-resistance to a minimum, has ample accommodation for its purpose, as well as room for the disposal of its main petrol tanks.

Based on its large experience of seaplane and boat construction the Company have now designed commercial-type machines which represent the fruit of all this experience, and which embody the most up-to-date ideas.



The Airco 23, of which a preliminary drawing is reproduced on this page, is a flying-boat designed to accommodate two pilots and six passengers. The engine is a 450-h.p. Napier "Lion." The speed of the machine is estimated to be 100 miles an hour at 5,000 feet, while it will have an endurance of 500 miles. Its useful load, comprising two pilots and passengers, represents 1,440 lb.

The Airco 6 seaplane—of which a drawing is also given—is constructed on the lines of the D.H. or Airco 6 aeroplane, which was used with such success, and for so many purposes, during the war. The machine was designed originally as a dual-control school machine. It was also used for reconnaissance, and for bombing submarines, and, more recently, as

The Airco 6 Seaplane (90 h.p. R.A.F. engine).

an ambulance machine. One of its chief features is its simplicity of construction, making it an ideal machine for the owner-flyer, and greatly reducing the flying cost and repair bill. As a joy-riding seaplane it is considered that it will be unequalled. Accommodation is provided for the pilot and one passenger. The engine is a 90-h.p. R.A.F. 1A, and the speed of the machine, at 1,000 feet, 60 miles an hour. It has a "ceiling" at 5,000 feet, gets off the water at 42 miles an hour and has an endurance of 180 miles. Its total weight is 2,440 lb.

The accompanying photograph gives a good idea of the size of an ordinary Handley Page twin-engined passenger machine compared with a modern touring car. The car is a 25/30 h.p. R.F.C. model Crossley. Mr. Handley Page is seen at the wheel, and Lieut.-Col. Sholto Douglas, one of the chief Handley Page pilots, is beside him.

The photograph was taken on an occasion on which a consignment of woollen goods was sent over to the Paris depot of Messrs. Bass, Walker and Company, of 2, Argyle Street, London. To accelerate the dispatch of these goods, a 25/30 h.p. Crossley was placed at the disposal of Messrs. Lavington Bros., the well-known shippers of Old Bailey, who arranged the shipment for Messrs. Bass, Walker and Company. The goods were conveyed to Hounslow by the car, and within 40 minutes of leaving London were on their way to Paris.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

GREAT BRITAIN.

CIVIL AERODROMES.

The Air Ministry announced on Oct. 11th that the following lists of aerodromes are issued as an addition or in amendment to the lists already published :—

LIST A. (Service Aerodromes only available for Civilian Machines in emergency.)

AMENDMENT.—The following aerodrome has been transferred to List E and is now published in that list :—

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Detling	Bearstead	Maidstone

LIST B. (Aerodromes temporarily retained for Service purposes.)

AMENDMENTS.—The following aerodromes have been transferred to List E, and published in that list previously :—

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Beverley	Beverley	Beverley
Chattis Hill	Stockbridge	Winchester
Doncaster	Doncaster	Doncaster
Killingholme	Harbrough	Grimsby
London Colney	Radlett	St. Albans
Penston	Macmerry	Haddington
Seaton Carew	Seaton Carew	West Hartlepool
Shoreham	Shoreham	Shoreham-by-Sea

LIST C. (Aerodromes temporarily retained for Service purposes.)

AMENDMENTS.—The following aerodromes have been transferred to List E, and are now published in that list :—

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Buckminster	Witham	Grantham
Harpswell	Kirton Lindsey	Gainsborough

LIST D. Aerodromes licensed as suitable for "Avro (504 K) and similar types of Aircraft" only. Except in very few instances accommodation does not exist. The licences have also in the majority of cases been issued for limited periods.

Aerodrome.	Location of Aerodrome.	Nearest Large Town.
Gleneagles	Adjoins station on main Glasgow-Perth railway.	Crieff
Coleford	South of Coleford on road parallel to G.W.R. line.	Gloucester
Wormwood Scrubs	S.W. corner of Wormwood Scrubs.	London (Hammersmith)
West Blatchington	W. of Hove Park, Brighton, at S.E. corner of W. Blatchington.	Brighton

LIST E. (Stations no longer in use by the R.A.F. These stations have been passed to the Government Property Disposal Board. They will be relinquished as soon as the Government property thereon has been disposed of. In many cases the aerodromes are now under cultivation, but it is probable that the sites still form the best emergency landing grounds in the immediate neighbourhood.

Aerodrome.	Nearest Railway Station	Nearest Large Town.
Buckminster	Witham	Grantham
Detling	Bearstead	Maidstone
Harpswell	Kirton Lindsey	Gainsborough

CONTINENTAL AIR SERVICES.

THE AIRCO SERVICE.

Eight weeks' continuous flying on the London-Paris service has now been completed by Aircraft Transport and Travel, Ltd. Out of 123 scheduled flights, 119 have been successfully completed. Approximately 30,000 miles have been flown on the service, making 283 flying hours.

Date.	Type.	Pilot.	Left Hounslow	Arr. Paris.	Left Paris.	Arr. Hounslow.	Pass.

THE FIRST PRIVATE COMMERCIAL AEROPLANE.—A D.H.4 biplane with a 375 h.p. Rolls-Royce Eagle VIII engine owned by S. Instone and Co., Ltd., steamship owners. The photograph shows the machine leaving for Paris on its first journey from Hounslow on Oct. 13th.

The firm's pilot, Lieut. F. L. Barnard (late R.A.F.), flew the machine on the same day from Cardiff to Hounslow in 56 minutes.

The machine carries the "house flag" of Instone and Co.

On Oct. 13th the D.H.16, piloted by Capt. Baylis, which left Le Bourget at 12.30 p.m., had a forced landing at Grand Villier, between Beauvais and Poix, owing to engine trouble. The three passengers and parcels were conveyed back to Paris and continued their journey by air on another machine the next day.

On Oct. 16th the D.H.9.R. machine, piloted by Capt. Gathergood, made the flight to Paris at the rate of 180 m.p.h.

Mr. C. B. Cochran flew from Hounslow to Boulogne in 40 min. in an Airco biplane, collected some costumes for his new production, "Maggie," and returned to London by air on Oct. 16th.

The Handley Page Services.

During the week ending Oct. 15th Handley Page Transport, Ltd., in conjunction with Messageries Aeriennes (Paris) (Bréguet machines), carried 60 passengers and 2,925 lb. of goods on their London-Paris service.

During the same week 20 passengers and 600 lb. of luggage were carried between London and Brussels. This service shows increasing popularity, but the carrying of merchandise by air to Belgium is not yet permitted.

An oil-painting worth £500, consigned by Messrs. Duveen to their Paris branch, was carried in the machine which left Hounslow on Oct. 18th.

The B.A.T. Service.

On the regular weekly service inaugurated by the British Aerial Transport Co. between London and Holland a saloon passenger biplane left Hounslow on Oct. 16th, piloted by Mr. C. Turner. The machine arrived at Amsterdam inside three hours.

On Wednesday, Oct 22nd, a saloon passenger machine with the full complement of passengers was due to leave Hounslow for Amsterdam, piloted by Maj. C. Draper.

London.

Hendon.—Fifty-eight passengers were taken up at the London Aerodrome by the Grahame-White Aviation Co. during the week ending Oct. 18th. Some 5,100 people have had flights in Avro machines during the summer. There are two pupils under instruction, a Miss Cadell and a Mr. Bryce, who will shortly be flying alone.

Hounslow.—A Vickers-Vimy commercial aeroplane, carrying two pilots and a mechanic, left Hounslow at 10.30 a.m. on Oct. 17th and arrived at Le Bourget (Paris) at 1.10 p.m. This machine will give exhibition flights at various places on the Continent.

An Ambitious Airship Scheme.

It is stated that a company named the Great Northern Aerial Syndicate has been formed to link up the world by an airship service. It is stated in the "Blackburn Weekly Telegraph" of Sept. 27th that the syndicate seek to acquire ground to the north of Southport, adjoining the golf course, where they propose to erect a mooring tower with an internal lift.

Three types of airships are said to be in contemplation to carry 32, 40, and 150 passengers. The smaller types are to be used for service in Great Britain and to the Continent. The largest type have had the following routes laid down for them :—(1) Liverpool to York, Hull, Copenhagen, Stockholm, Petrograd, Tomsk, Pekin, San Francisco, New York, Queenstown, and Dublin; (2) Liverpool to London, Paris, Barrow, Colombo, Perth, Melbourne, or Sydney; (3) Liverpool to Cardiff, Lisbon, Sierra Leone, Capetown, Buenos Ayres; (4) to India, Belgium, Germany, Austria, Turkey, and Persia.

The larger airships are to be fitted up in a luxurious style, with carpeted floors, and folding armchairs, similar to the Pullman car, with large windows. A balcony will run along the outside of the car. The cost per mile is put at about half the cost of a taxi-fare to-day, approximately about 9d. per mile.

Bournemouth.

The Supermarine Aviation Works, Ltd., have announced that their flying-boats will continue to carry passengers on suitable and fine days during the autumn and winter seasons at Bournemouth. A large number of visitors are always at the resort in the coming seasons, and particularly fine weather is always experienced during some periods.

The booking agents are Messrs. Sydenham's Library at the Pier Approach. Flights can be made for two guineas and three guineas. Passengers will also be carried to Southampton in the afternoons for four guineas in minimum parties of three.

Brooklands.

The following notes, dated Oct. 19th, have been received from a correspondent :—

Two biplanes, entered for the flight to Australia, have been tested recently at Brooklands. One is the Sopwith "Wallaby," of which Capt. Matthews and Serjt. Kay are the "crew."

The Martinsyde machine which will also attempt the flight is practically ready. Capt. Howell will be the pilot. No information is yet to hand as regards the date when the Martinsyde will start. This machine is very similar to the Martinsyde Transatlantic machine in appearance and in performance. It has a "Falcon" 285-h.p. Rolls-Royce engine, and it is a two-seater.

Mr. F. P. Raynham, who until recently had been testing machines for Martinsyde, Ltd., and Vickers, Ltd., at Brooklands, has flown to Spain on an F.4, presumably for business purposes in connection with Martinsyde, Ltd. Lt. Nisbet, who was second in the Aerial Derby on a Martinsyde F.4, has been engaged as a test pilot by Martinsyde, Ltd. He has recently flown in test flights over the sea both the Australian flight machine and a biplane which his firm have constructed for a film company.

The sea tests of the former machine were very satisfactory. Some alterations and modifications are being made to the film machine.

Martinsyde, Ltd., have lately greatly reduced the number of their employees, and are engaged in manufacturing various small and useful articles. They have produced a two-seater machine similar to their F.4, having practically the same performance. It is expected that this machine will be placed on the market as a sporting model.

Leighton Buzzard.

According to the "Morning Post" of October 8th a new Vickers "Vimy" bomber, fitted with two Rolls-Royce engines, was destroyed by fire recently at Morgan and Co.'s aerodrome at Leighton Buzzard. The value of the aeroplane was over £8,000.

The fire was caused by a workman attempting to take petrol from one of the tanks while a hurricane lamp was near.

Newcastle.

For the first time in the history of commercial aviation tinned fish was carried by aeroplane on Oct. 10th from Newcastle to Edinburgh. An Avro biplane was hired by Angus Watson and Co., canned goods manufacturers, of Newcastle, from Vickers, Ltd., and started on its journey at 9.30 a.m.

It was piloted by Capt. Simpson (late R.A.F.), and carried a cargo of 333 lb. of canned goods consigned to R. and T. Gibson, provision merchants, of Edinburgh. The aeroplane arrived at Turnhouse Aerodrome (Edinburgh) at noon.

A large party witnessed its arrival at Edinburgh, including the Senior Magistrate and representatives of the Edinburgh Chamber of Commerce and the Rotary Club. The company were afterwards entertained to lunch.

The purpose of the flight is not quite clear, but some benefit accrued therefrom as several people obtained a good free lunch as a result of its success.

Southampton.

Demonstration and passenger flights will be given by the Supermarine Aviation Works, Ltd., in their flying-boats at Woolston throughout the winter months.

IRELAND.

At a meeting of the Pembroke Urban Council on Oct. 13th a letter was read from A. V. Roe and Co., Ltd., asking the Council's permission to land their aeroplanes at Merrion Strand, as they proposed to link up by air the principal towns in Ireland, starting for one year from May 1st, 1920.

It was the intention of the company to land and take up passengers at Merrion Strand for services to Cork and Belfast, etc. From the Strand the service will have to be tidal.

CANADA.

Capt. Baskerville (late 117th Squadron R.A.F.) proposes to establish an aerial service in Thousand Islands next summer.

BRAZIL.

According to the "Times" of Oct. 15th the Brazilian Budget for 1920 includes the establishment of an aerial postal service. The Government's loan will amount to £5,000,000.

CHINA.

The Chinese Government has entered into a contract with Vickers, Ltd., for the supply of a large number of Vickers-Vimy commercial aeroplanes. It will be remembered that Handley Page, Ltd., have also built several machines for China.

An issue of £1,800,000 in Treasury notes is being made, all to be expended in the development of commercial aviation. This sum will meet the cost of the purchase of machines, construction of aerodromes, repair depots, and administration.

DENMARK.

The Danish correspondent of The Aeroplane writes :—

Flying Activity.

With the exception that civil flying was not impossible during the war from universal concentration on military aircraft production but from lack of fuel, aviation has developed here much along the same lines as in England, commercial

The Success of the R.34.

Extract from General Maitland's Log:

MIDNIGHT—

"As we lay in our hammocks we listened to the rain beating pitilessly down on the outer cover of our trusty ship of the air, and our feelings, despite the weather, are those of complete confidence and security."

The success of this history-making trans-Atlantic flight and of the subsequent long distance voyages under adverse weather conditions, was largely contributed to by the fact that her cover was finally doped by our **SCHEME H.2.** which was applied

ON THE TOP

of the ordinary dope, thus rendering the cover weather-proof and water repellant.

SPECIAL DOPE H.2

is manufactured entirely by

THE BRITISH CELLULOSE & CHEMICAL MFG. CO., LTD.

the largest manufacturers of Cellulose Acetate in the World, and has been supplied exclusively by them to the British Government for the final doping of the outer cover of

R.32, R.33, R.34.

8, Waterloo Place, LONDON, S.W.1.

Works: SPONDON, DERBY.

Telephone: Regent 4045 (Three lines).

enterprise having during this season been interfered with by official regulations. The chief activities have been in the joy-riding business field, newspapers coming next in the employment of the new transport means, so far mainly from the advertising point of war.

The former commanding officer of the Richthofen squadron, Lieut. Goering, has flown a part of the provincial edition of the weekly paper, the "Home," to Odense, being, however, unable to carry out the other scheduled flight to Aalborg. The Danish former test pilot Reichert, by Albatros, has on his illuminated biplane bombarded Copenhagen by night on behalf of a penny paper, dropping cases containing money, while the public could further win prizes from guessing his correct height when throwing lights above some squares. The Sleswig pilot Schmidt has started a provincial trip, arranged by the German technical manager, Klatte, of Danish Air Express. The passenger and author, Emil Bonnelyoke, read papers on the psychology of Flying in the evening in the cities called on.

The Farman Goliath.

Having carried out a number of joy-rides from the Lundtofte aerodrome over the capital and the surroundings, with paying passengers and a number of guests, including members of the Press and the Air Commission, the Farman Goliath was unfortunate when intending to return to Paris with passengers at £80 each. First a Custom officer turned up, asking a duty of £550, as the foreign aircraft had not only paid the country a flying visit, but carried out advertised joy-riding business. Then the crankshaft breaking of the one 300-h.p. Salmson motors at the Goliath's arrival was repeated with the other engine. So the French twin-engined biplane is still in Copenhagen, and Lieut. Krause-Jensen has returned to Paris.

Too Late.

When the breakdown of a Titan-made crane held up the unloading of a steamer with coal cargo in Aarhus, the firm, Kampmann, Herskind, and Co., in these coal-scarce times, resolved to have the missing gear wheel sent by aeroplane from the Copenhagen works. Owing to a strong head wind the pilot, Flt. Serjt. Bjarkow, on an L.V.G. biplane, ran short of petrol by Kallundborg and had to bring the wheel to the ferry, and thus it arrived too late for the object.

The First Italian Arrivals.

The first of the many and often-announced Italian aeroplanes to arrive was a 200 h.p. engined Savoia seaplane, piloted by Lieut. Count di Robilant, with mechanic Bramucci as passenger, who arrived at Copenhagen (having crossed the Alps and flown along the Rhine Valley to Amsterdam) *via* Cuxhafen, the Kiel Channel, and Nakskov, where he made an intermediate landing to replenish, having run short of lubricating oil. An accompanying sister craft made a forced landing at Borkum, in Germany.

Count di Robilant continued after some days' stay to Stockholm, which was not reached in a non-stop flight, and returned by railway to go to Amsterdam and arrange for a squadron flight to Scandinavia of some of the pilots staying there, the route to be Amsterdam, Gothenburg, Stockholm, Copenhagen.

ICELAND.

The Danish correspondent of The Aeroplane writes :—

The English-Danish Captain Cecil Faber (late R.A.F.) has returned from his pioneer flying work for the establishment of commercial aviation at the Danish island colony. His aeroplane was seen there recently for the first time. Capt. Faber has made 147 flights on an Avro biplane, the longest of which was to the Westmanna Islands, while his biggest number of flights carried out in one day amounted to 30.

FRANCE.

New Farman Machines.

M. Henri Farman has made several flights lately at Buc on the little Farman monoplane which he calls "Le Moustique," which is of 15 ft. span and is fitted with a 35 h.p. A.B.C. engine. The price to the public of this machine is £120. There is also a small two-seated Farman biplane, fitted with a 50 h.p. Le Rhone engine, which is to be sold complete for £300, or at least so rumour says. It has made many good flights recently. This machine is to be known as the "David" that the Farman "Goliath" may not feel unduly lonely.

A Longchamps Incident.

On Oct. 12th a French aviator, M. Carignan, landed on the racecourse at Longchamps during the races to set down a lady passenger. He then endeavoured to fly back to his aerodrome, but sideslipped and fell before getting beyond the confines of Longchamps. The crowd endeavoured to attack him, but were prevented by the police. A summons is being taken out against the aviator on a charge of reckless flying. "L'Auto" aptly heads a paragraph dealing with this incident with the phrase "Les ennemis de l'aviation."

The Prix Peugeot

The aviette designed by M. Baligant is now known as the Baligant-Quénault, as M. Marcel Quénault will pilot it in its trials. M. Quénault was at one time an employee in the Voisin works at Billancourt.

The Aero Club de la Brie.

M. Dumesnil, Under-Secretary of State for Aeronautics during the war, has accepted the office of President d'honneur of the Aero Club de la Brie.

The Coupe Deutsch.

Several attempts were to have been made on the Coupe Deutsch on Oct. 13th, so many that what is in truth partly a time contest bids fair to become a race. Fog and engine trouble eliminated most of the competitors, and only M. Jansen, flying a Nieuport monoplane (180 h.p. Le Rhone), completed the course of 200 kilometres 655 metres (Saint Germain-Meaux-Melun-Senlis-Saint Germain) in 46 min 55 sec.

Sadi Lecointe made three attempts to start, but fog and engine trouble forced him to land finally at Juvisy. M. Rost was also brought down owing to fog.

A correspondent writes :—"M. de Romanet has been having trouble with his Nieuport owing to irregular petrol delivery due to having a pressure installation instead of the Weymann vacuum system usual on Nieuport 29s."

On the following day M. Rost on a Gourdou-Leseurre monoplane (180 h.p. Hispano-Suiza) completed the circuit in 55 min., thus beating M. Jansen's speed, but not by the 10 per cent. which would have made him temporary holder of the cup.

M. de Romanet, Nieuport biplane (300 h.p. Hispano-Suiza), also made an attempt to complete the circuit, but was compelled to land owing to engine trouble. His speed was 183 miles an hour.

On Oct. 15th, M. Sadi Lecointe (Spad Herbemont biplane, 300 h.p. Hispano-Suiza) flew over the Coupe Deutsch circuit at a speed of 153.8 miles an hour.

The Commission Sportive de l'Aero Club de France met on Oct. 17th and homologated the following claims to the Coupe Deutsch, from which it will be seen that M. Sadi Lecointe is the temporary holder of the Coupe.

1. To the Société des Etablissements Nieuport :—Leth Jansen accomplished the circuit on Oct. 13th, 1919, at a speed of 124.6 miles an hour.
2. To M. Sadi Lecointe, who accomplished the circuit on Oct. 15th, 1919, at a speed of 153.8 miles an hour.

The Automobile Show.

Several firms whose interests in recent years have been solely or mainly centred in aeronautics are exhibiting motor-cars of their own design and construction. Among these are the Farman, Voisin, and Gnome-Le Rhone firms. The cars are all expensive and large.

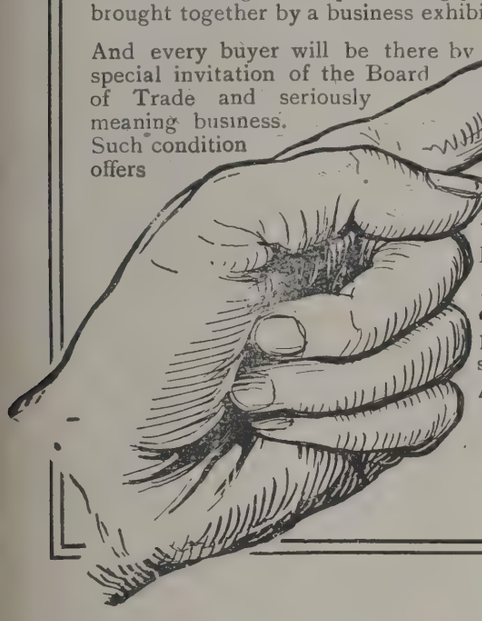
The Paris-Melbourne Flight

M. Poulet and M. Benoist, his mechanic, on a Caudron biplane (two Le Rhone engines), left Issy-les-Moulineaux en route for Melbourne at 7 a.m. on Oct. 14th. They passed over Valence at 11.05 a.m. and landed at Fréjus shortly afterwards. As they flew over Saint Rambert d'Albon, where Védrines is buried, M. Poulet dropped a wreath to which was attached a card on which was inscribed the words, "A mon ami Védrines."

M. Poulet reached Centocelle aerodrome, near Rome, at 10.15 a.m. on Oct. 16th. Between Genoa and Rome he was brought down owing to low clouds and strong winds. After a short rest he continued his journey. On Oct. 17th he flew to Naples, and left that place on Oct. 20th at 6.30 a.m. for Salonika.

HOLLAND.

German Aeroplanes at the E.L.T.A.



Interesting news comes from Holland concerning the fate of the E.L.T.A. Exhibition buildings and aerodrome. It seems that Herr Fokker has bought up the whole of the buildings and the aerodrome, and as soon as the Exhibition was over and the British machines had left he began filling the place with German machines of all sorts and sizes. The result is that at the present moment there are something like 200 assorted German aeroplanes stored in the E.L.T.A. buildings.

The big dismountable sheds put up by Alban Richards and Co. are still on the ground, and the representatives of the firm refuse to house German machines in them, consequently, those which are unable to crowd into the Exhibition buildings have to stand out in the open.

Evidently, the German Aircraft Industry is more alive to the possibilities of Holland as an aerial junction than is the

All the Business World will be There

and the assemblage of Home and Foreign Buyers will constitute the greatest purchasing power ever brought together by a business exhibition.

And every buyer will be there by special invitation of the Board of Trade and seriously meaning business. Such condition offers an unprecedented opportunity for that individual expansion which is an absolute essential to our National prosperity.

You must not miss that opportunity! You can exhibit at Birmingham, and at Birmingham only—

AERONAUTICAL MOTOR APPLIANCES, ***and All goods exhibited must be of British Manufacture.***

The "Bristol" Aeroplanes

"BRITAIN'S PIONEER AIRCRAFT CONSTRUCTORS."

Erecting Hall at the Filton Works.

In the Company's splendidly equipped works, extending over nine acres, everything for the complete aeroplane, except the engine, is produced.

Experimental work is constantly in progress, and improvements are immediately embodied in the "BRISTOL" machines.

It is this progressive policy coupled with meticulous accuracy in construction and workmanship, which have earned for the "BRISTOL" Aeroplanes a world-wide reputation for unfailing quality, reliability and performance.

THE
British & Colonial Aeroplane Co., Ltd.
FILTON — BRISTOL.

Telegrams: "Aviation, Bristol." Codes: A.1. A B.C. & Moreing. Telephone: 3906 Bristol.

British Aircraft Industry, but it would be interesting to see how these proceedings agree with the Peace Treaty.

The Italian correspondent of The Aeroplane writes :—

Eight millions of florins is mentioned as the very useful sum that Holland is spending on Italian aeroplanes.

ITALY.

British Help Refused.

The Italian correspondent of The Aeroplane writes :—

A report tells of an offer made to the authorities here by an English concern desirous of running certain aeroports in Italy, which kind help was, it is said, more kindly declined. This report may be more of the anti-British work of the enemy in our midst.

New Machines.

A small aeroplane of 3½ metres span is said to be constructing at Naples, and a four-motored Savoia seaplane is forecasted.

An Arrival at Turin.

The return to the Pozzo-Strada (Ansaldo) aerodrome at Turin of Engineer Brezzi and his pilot Stoppani, on their 300 h.p. Ansaldo, from their grand tour of the Central European capitals, was a great event. It had flown to Vienna-Warsaw-Berlin and return, a distance of 6,000 kilos. At Warsaw a second passenger was picked up who was carried over the "Archies" to Berlin. The machine (described in my account of the Taliedo Show) has so made good. It had previously done an Amsterdam and Brussels trip from Turin.

A Caproni with Floats.

The Caproni firm have always held that their large triplane could fly with floats. One has been thus fitted and flies capitally. It is stated that tests at Sesto Calende have led to business with an allied nation.

The "Airport" Co.

The big company promoted to run the Airport of Rome is moving fast. The "Aerobatics" School at Monte Celis, outside the city, is already in their hands, and Centocelle may follow.—T. S. H.

SWEDEN.

The P.O. Flygkompani.

Major C. H. R. Johnston, of the "P.O. Flygkompani," wishes to correct the idea that the company have any connection with A. V. Roe and Co., Ltd. The "P.O. Flygkompani" started to operate in June with the purchase of two Avros and a D.H.6. The pilots are Major Johnston (late R.A.F.), Captain Saunders (late R.N.A.S.), and Lieut. Johnson (late R.A.F.). The latter returned to England on Oct. 3rd to fetch another machine over to Sweden.

The C.O. of the enterprise is Lieut. Herrström (late Swedish Horse Guards and Swedish Flying Corps). He is himself a pilot. The mechanics are half English and half Swedish. The company has a very excellent "impresario" in the person of a Swede, who incidentally made the first commercial flight from Sweden to Finland some years ago in a Morane Parasol.

They have been giving exhibition and passenger flights in different towns in Sweden, and so far have visited 25 towns, spending from two to three days in each, and in the larger towns a fortnight or more. In each place "stunt" flights are given first and then passengers are taken up at prices varying from 100 kr. up to 1,500 for an advertisement flight. The flight for 100 kr. takes about eight minutes; 150 kr. are charged for stunting. Many hundreds of passengers have been taken up at each town and no trouble or injury has been experienced.

The company's pilots are at present in the middle of a tour in the South of Sweden which will last until the approaching winter makes it necessary for them to return to headquarters at Barkarby and fit skids onto the machines. Then they will start for the North, where aeroplanes are less known than anywhere else in the country. At the flying school at headquarters, which is about 10 miles outside Stockholm, they have a waiting list of 10 pupils who wish to join when they have room.

They are the only British aviators in Sweden and the enterprise is financed equally with English and Swedish capital. The "joy-ride" side of civil flying cannot last for ever, but at present it provides the best way of making British men and machines popular in Sweden. At the same time it gives a useful profit. The company has plans maturing for other enterprises in connection with civil aviation, and when opportunity offers these will be opened up.

It would be possible to do a good business in British machines if firms were in a position to offer the goods at once and at reasonable terms. At present German machines are selling best owing to the low rate of exchange. There is an "Aerial Derby" coming off soon, and Major Johnston is living in hopes of obtaining a Scout machine to enter for it.

At last representatives of two English firms have arrived, namely Bristol and Vickers—both, unfortunately, without any specimens of their wares to exhibit. However, they are both looking round and seeing what is wanted in the country.

An Italian Visitor.

A large German-made canvas hangar has been put up for the reception of the Caproni machine which is due. Nothing further has been heard about it.

SWITZERLAND.

There was some delay after the arrival of Capt. H. M. Goode and Capt. Eric Bradley (late R.A.F.) in Switzerland before permission was given to the latter to fly in the country. He has now received permission to fly. No other foreign aviator has a similar authorisation.

Mr. Bradley is the instructor at M. Pethoud's "Aero Ecole d'Aviation" at Lausanne. The Avro machine which he flew to Switzerland has become very popular in the town, and pupils are joining the school in very satisfactory numbers.

The Italian correspondent of The Aeroplane writes :—

The Savoia machines have had considerable success on the Swiss lakes lately. One Pillichody is in Italy on the late Oscar Bider's unfinished work of introducing the machines for Swiss lake work.

UNITED STATES OF AMERICA.

A Handley Page Flight.

The Handley Page machine, which was intended for the Transatlantic flight, and afterwards attempted to meet the R.34 at New York, but crashed in a forced landing at Parrsborough (Nova Scotia), has now been repaired.

On Oct. 9th the machine left Parrsborough at 10.44 a.m., commanded by Vice-Admiral Kerr, and piloted by Major Brackley, carrying in all 11 passengers. Owing to very strong adverse winds encountered, the machine did not reach New York (625 miles) on the same day. It was forced to land at 11 p.m. at Greenport, Long Island, 95 miles from New York, owing to shortage of petrol.

The machine circled over the village for 20 minutes. The villagers built bonfires to show the machine a good landing-place. Major Brackley made a perfect landing in a field, and hearty greetings were exchanged all round.

Admiral Kerr said that the Handley Page had established a new record in carrying 11 passengers for a period of 12 hrs. 1 min. non-stop. The machine was to proceed to Mineola (New York) on the following morning.

Reuter stated on Oct. 8th from New York that a Caproni machine was going to ascend from Mineola to escort the Handley Page to the aerodrome.

[One imagines that a Caproni was chosen because "birds of a feather flock together," and also to minimise the chance of the machines missing seeing each other.—Ed.]

The Handley Page machine arrived at Mineola on Oct. 13th. A non-stop flight will shortly be attempted to Chicago with twelve passengers.

A Farman Agency.

Mr. W. Wallace Kellett has arrived recently from France as an agent for Henri and Maurice Farman. He stated that offices would be opened on Oct. 1st at West Thirty-fourth Street, New York.

Hangars and workshops are to be erected on Long Island, where the aeroplane parts shipped from France will be assembled. A three-passenger-carrying aeroplane is on the way from France for demonstration purposes.

An Inspection of Road Repairs.

Mr. Eddy Stinson recently carried a contractor in a Curtiss biplane in Ohio. They flew 300 ft. above a new brick road which was nearing completion and built by the contractor.

Learning to Fly from the Cinema.

During the war a school was instituted in America to teach pilots correct methods of handling an aeroplane by demonstrations on cinema screens. A civil aviation company have recently opened a similar establishment attached to an aerodrome where aspiring pilots may take a short theoretical course on the film.

The pupil takes his seat in an aeroplane in a dark room. Immediately in front of the machine is the screen, on which pictures are projected whilst an instructor gives an accompanying lecture. Pictures are shown demonstrating the correct methods of using the controls, for example, how to take off and land. The student is instructed to act as if the incidents depicted were actually taking place.

It is said that pupils who have passed a course of cinema tests have invariably proved careful and efficient pilots.

A HOAX RECALLED.

A Dutch writer has pointed out that the R.34 recently made a voyage from America to England in 75 hours, and it was just 75 years ago that Edgar Allan Poe published in the "New York Sun" his hoax about an English airship which flew across the Atlantic in 75 hours.

Steel & Service

The name of Edgar Allen's has always been associated with steel of the finest quality, and it is also linked up with the idea of service. The undermentioned list of handbooks and catalogues indicates one way in which this idea is carried into execution. Write for

Edgar Allen's

CATALOGUE "G."
There is a right steel for every tool. This book will help you to choose the right steel.

CATALOGUE "D."
Describes Edgar Allen's Motor Car and Aircraft Steels, of which many are of great service in general engineering work.

CATALOGUE "B."
Describes the peculiar properties of Edgar Allen's "Imperial" Manganese Steel, and shows by illustrations where its use effects savings in mining and engineering work.

"FACTS ABOUT FILES"
Tells you how to get the most work out of Edgar Allen's Files and how it pays to take care of them.

Write for that which interests you.

Bowden
WIRE MECHANISM

The OLD MARK — commonly known as the "Bowden Loop of Wire"—has been misused abroad, so we have discarded it.

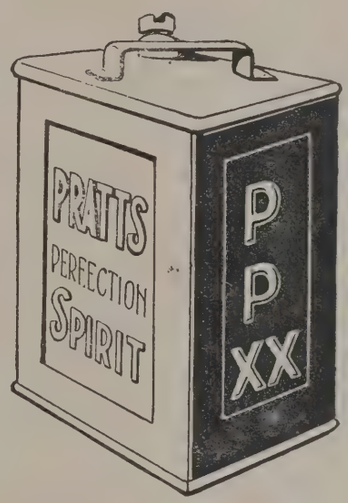
We invite enquiries.

Bowden Wire, Ltd., London,
Victoria Rd., Willesden Junction, N.W.10
Established 1897.

One of the most valuable of twentieth century inventions is the

BOWDEN WIRE MECHANISM

It is known to millions of motorists and motor cyclists the world over. It is seen now on thousands of cameras, and in a multitude of other applications. War has evolved many fresh uses for this remarkable invention. The original brands of the wire are known under the following Trade Names (registered as Trade Marks in most civilised countries):



BOWDENSILVER,
BOWDENBRASS
BOWDENITE.
BOWDENOIR.
BOWDENSOLO.

Medal of Military Merit, 3rd Class.

Sqdn. Leader S. G. Hodges, M.C., A.F.C.

AIR MINISTRY, Oct. 10th.

R.A.F.—The following Officers have been granted short service commns. in the ranks stated, with effect from Oct. 10th. They will retain their seny. in the substantive rank last held by them prior to the grant of the short service commn.:—

Sqdn. Leader.—R. C. Lane (T.).

Flight Lts.—J. H. D. M. Campbell (S.O.); H. Cooch, A.M.I.E.E. (T.); P. E. L. Gethin, A.F.C. (A.); E. L. Johnston, A.F.C. (Airship); C. O. F. Modin, D.S.C. (A.); A. J. Osborn (S.O.); G. W. Robarts, M.C. (A.); N. V. Wrigley (T.).

Flying Officers.—R. M. Grundy (Ad.); H. Hoad (T.); A. E. de M. Jarvis, D.F.C. (A.); A. A. Jones (T.); H. P.-G. Leigh (T.) (with effect from Oct. 6th); F. W. Martyn (T.); H. L. Rough, D.F.C. (A.); E. R. Webb (Ad.).

NOTE.—It is intended that officers empld. as Stores Officers or on "Q" duties shall belong to the new Stores Branch when formed. Officers appearing in this "Gazette" who are at present so empld. will be transferred to this Branch on its formation, and will accept these short service commns. on that condition. They will then come on to rates of pay of that Branch, but will meantime be permitted to draw the higher rates laid down in the new scheme for officers on the Gen. List. Any officer posted to the Stores Branch on its formation will then have the option of declining his short service commn.

The notification appearing in "Gazette" of Sept. 12th appointing the following officers to short service commns. is cancelled:—Flight Lt. H. J. Edgar (A. and S.); Flight Lt. A. E. Siddons-Wilson (T.); Flying Officer J. H. Dale (T.); Flying Officer H. B. Day (Ad.); Flying Officer A. G. Jarvis (A.); Flying Officer R. V. Kann (A.); Flying Officer G. A. Lingham, D.F.C. (A.); Flying Officer W. G. Pudney (A.); Flying Officer A. E. Sweeting (A.).

The notification appearing in "Gazette" of Sept. 16th appointing the following officer to a short service commn. is cancelled:—Flight Lt. C. W. McCann (T.).

The second Christian name of Flight Lt. Charles Geoffrey Murray, O.B.E. (S.O.), is as now described, and not Godfrey, as stated in "Gazette," Sept. 12th.

The second Christian name of Flying Officer James Duff Hewitt (A.) is as now described, and not Dorr, as stated in "Gazette," Sept. 16th.

Flying Officer A. C. Lobley is granted a short service commn. with effect from Aug. 16th, not Sept. 12th as stated in "Gazette" of the latter date.

YOU can now buy for your Car the same incomparable grade of petrol as Capt. Sir John Alcock used on his Great Atlantic Flight—

"SHELL AVIATION"

MOTOR SPIRIT

Obtainable of all dealers

"SHELL" MARKETING CO., LTD.,
39-41 Parker Street, Kingsway, London, W.C.2.

A Blizzard-Proof Coat

Designed by expert flying men, and made in the Burberry-proofed material worn by Sir John Alcock on his Trans-Atlantic flight, The

BURBERRY AIR-WARM

provides a lightweight, yet warm and dependable, defence against rain, mist or cold wind.

The inside is of luxuriously soft, thick Camel Fleece. The coat is workmanlike in every detail, and has nothing about it to catch in any part of the machinery.

Its two parts can be worn separately or together—the outside alone, providing a Weatherproof that excludes wet or wind without rubber or other airtight material; the Fleece lining, a smart coat of the British Warm type; and the two together, the staunchest self-ventilating safeguard possible.

Complete R.A.F. Kit in 2 to 4 Days or Ready for use.

SAVE MORE WEIGHT.

Paint and other protective coatings add materially to the weight of steel parts without increasing their strength. Moreover, parts made of ordinary steels, however protected, require constant inspection to guard against weakening through rust and corrosion.

All these disadvantages can be avoided by using

FIRTH'S STAINLESS STEEL

It can be heat-treated to give the mechanical properties desired in aircraft work and resists rust and corrosion.

Pilot Officer H. C. McKinley to be Pilot Officer, from (O.), Sept. 26th.

Sec. Lt. R. R. W. Millward (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt., June 11th, 1918.

The following relinquish their commns. on ceasing to be empld. :—Lt. A. V. Faulks, June 16th; Capt. J. B. Morgan, Aug. 9th; Maj. C. V. Beresford (Maj., Worc. R.), Sept. 1st; Lt. R. R. Money (Lt., E. Yorks R.), Sept. 20th; Capt. F. Tuttie, D.C.M. (Qrmr. and Capt., R. Berks. R.), Sept. 25th.

Sec. Lt. S. D. Harrower (Sec. Lt., Bedfordshire R.), Sept. 27th.

Capt. D. C. L. Speed, O.B.E. (Capt., King's Royal Rifle Corps), Sept. 27th.

The following are transferred to unempld. list :—Sec. Lt. A. H. Black, Feb. 17th; Sec. Lt. J. B. Russell, D.F.C., Feb. 24th; Lt. H. Brooks (substituted for notification in "Gazette" of July 18th), Lt. H. F. Cochran (substituted for notification in "Gazette" of June 20th), May 31st; Lt. (Hon. Capt.) H. G. Whyte, June 4th; Sec. Lt. H. P. Jeppe, June 10th; Lt. C. W. L. Calvert, June 11th; Sec. Lt. F. E. Ross, June 22nd; Sec. Lt. W. A. Keeler, July 12th; Lt. H. R. M. Dodd, July 26th; Sec. Lt. R. Betts, Aug. 27th; Sec. Lt. T. B. Dick, Aug. 31st; Sec. Lt. J. H. L. Dickin, Sec. Lt. R. G. Smith, Sept. 2nd; Sec. Lt. R. A. C. Craddock-Hartopp, Sept. 5th; Sec. Lt. A. G. Chapman, Sept. 8th; Sec. Lt. N. Critchley, Sec. Lt. (Hon. Lt.) T. Mumford, Lt. (Hon. Capt.) F. W. Napper, Sept. 9th; Lt. J. F. V. Rider, Sept. 10th; Lt. E. St. H. Davies, Sept. 12th; Lt. H. F. Hendry, Sept. 13th (substituted for notification in "Gazette" of Sept. 23rd); Sec. Lt. H. H. Price, Sept. 17th; Sec. Lt. (Hon. Lt.) R. D. Thomas, Sept. 18th; Lt. A. E. P. Smith, Sept. 19th; Capt. F. Steel, O.B.E., Sept. 21st; Lt. E. Emley, Sec. Lt. E. J. Jordan, Lt. G. S. Lee, Sec. Lt. C. H. Phillips, Capt. (Hon. Maj.) G. N. F. Powell, Lt. H. C. Vickery, Sec. Lt. W. G. Wheatland, Sept. 23rd; Lt. G. Thomson, Sec. Lt. W. B. Young, Sept. 24th; Lt. H. R. Little, Sept. 25th; Lt. F. S. Fooks, M.C., Oct. 1st; Lt. A. Waterworth, Oct. 2nd; Sec. Lt. (actg. Maj.) A. R. Fulton, M.B.E., Oct. 10th; Lt. W. H. Goodbrand, Oct. 13th.

The following Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank :—W. B. W. Clarke (contracted on active service), H. H. Wade (caused by wounds), Oct. 2nd.

The following Sec. Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank :—J. Skinner, Sept. 28th; L. G. Davies, Oct. 3rd; J. W. Rimmer, Oct. 4th (contracted on active service); C. A. Seymour, Oct. 9th.

The notification in the "Gazette" of Oct. 7th concerning Sec. Lt. J. Skinner is cancelled.

The notification in the "Gazette" of Aug. 22nd concerning Lt. (Hon. Capt.) H. G. White is cancelled.

The notification in the "Gazette" of Dec. 24th, 1918, concerning Sec. Lt. R. Boyle is cancelled.

TECHNICAL BRANCH.—Sec. Lt. (actg. Capt.) J. W. Tattersall to be actg. Maj. whilst empld. as Maj., Grade (A.), June 10th.

Capt. (Hon. Maj.) H. R. P. Reynolds is graded for purposes of pay and allowances as Maj. whilst empld. as Maj., Grade (A.), from (Ad.), from Dec. 7th, 1918, to June 5th.

Capt. E. Rivers-Smith, M.B.E., is graded for purposes of pay and allowances as Maj. whilst empld. as Maj., Grade (B.), May 14th.

Flt. Lt. W. E. L. Seward, M.C., relinquishes the grading for purposes of pay and allowances as Sqdn. Ldr. on ceasing to be empld. as Sqdn. Ldr., Grade (A.), Aug. 20th.

To be actg. Capts. whilst empld. as Capts., Grade (A.) :—Lt. S. J. Gardiner, Sec. Lt. P. S. Riach, June 10th.

Lt. L. R. Staddon is graded for purposes of pay and allowances as Capt. whilst empld. as Capt., Grade (A.), April 1st.

Lt. P. A. Wright is graded for purposes of pay and allowances as Capt. whilst empld. as Capt., Grade (B.), from (Ad.), May 14th.

Flying Officer A. W. H. Phillips relinquishes the grading for purposes of pay and allowances as Flt. Lt. on ceasing to be empld. as Flt. Lt., Grade (A.), Sept. 17th.

Flying Officer E. S. Cohen to be Flying Officer, Grade (B.), from Grade (A.), and relinquishes the grading for pay and allowances as Flt. Lt. on ceasing to be empld. as Flt. Lt., Grade (A.), Sept. 8th.

Flying Officer (actg. Flt. Lt.) H. G. Wood relinquishes the actg. rank of Flt. Lt on ceasing to be empld. as Flt. Lt., Grade (B.), Sept. 18th.

Lt. F. H. Isitt to be Lt., Grade (B.), from (Ad.), June 10th.

Lt. E. W. Lawrence is graded for pay and allowances as Lt. whilst empld. as Lt., Grade (B.), Nov. 12th.

(To be continued.)

OCTOBER 29, 1919.

THE AEROPLANE

VOL. XVII. No. 18.

The Editorial and Advertising Offices of "The Aeroplane" are at 175, Piccadilly, London, W.1.
Telegraphic Address: "Aileron, London." Telephone: Gerrard, 5407.

Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Street, London, W.C.2.

Subscription Rates, post free: Home, 3 months, 7s. 6d.; 6 months, 15s.; 12 months 30s. Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8. U.S.A., 1 Year, $8 50c.

ON THE FLYING SERVICES, THE AIRCRAFT INDUSTRY AND GRAFT.

To those who have followed during the war the continual agitation in this paper for better aeroplanes and engines for the Flying Services, the recent attack in the daily Press against the Air Ministry on the score of extravagance must seem very amusing. Or, at any rate, they would be amusing if they were not so irritating.

That excellent journal the "Morning Post" seems to be the leader in these attacks, which apparently have for their object the abolition of the Air Ministry. One is far from being out of sympathy with that object, for, though one is prepared to admit that an Air Ministry may be a useful thing to have about the national house, one cannot convince oneself that it is anything in the nature of a necessity even as a Civil Department, and it is still less a necessity as a Naval or Military Department.

All the work that it could possibly do as a Civil Department could be done as well—it could not be done worse—by a sub-section of the Ministry of Transport, and all its Service work—good as it is—could be done very much better by departments of the Admiralty and War Office. In fact, so far as the Admiralty is concerned, either the Admiralty will be forced in the near future to take over the Naval side of the R.A.F., or else the R.A.F. will have to take over the Navy, for recent events coming right on top of the experience of war have demonstrated that the Navy, as at present existing, is superfluous, and that Lord Fisher's explosive dictum "Sack the lot!" may be applied by the nation to the whole Navy apart from that portion concerned with aircraft.

Charges Ancient and Modern.

Before expatiating further on the superfluity of the Navy, one would like to say a few more words concerning the before-mentioned attacks on the Air Ministry.

Those who have read this paper during the war will recognise all the charges now brought against the Air Ministry as old friends. They are precisely the same as those which were brought up at the Air Inquiry into the maladministration of the R.F.C. in 1916. And they are precisely the same as those into which the Admiralty refused to permit inquiry at the same period. Therefore they are not in fact charges which ought to be brought against the Air Ministry at all. They ought to be brought retrospectively against the Admiralty and War Office.

The only novelty about the charges is that since the Armistice contractors for aircraft supplies have been allowed to continue their output unchecked until Peace was definitely declared. As the Armistice came after the Admiralty and War Office ceased to handle aeroplane supplies, naturally the Air Ministry is the department at which most of these charges are levelled. But those who make the charges find it convenient to forget that the Admiralty continued to build airships and their appurtenances long after most of the aeroplane contracts had been cancelled, and that the final cuts in aeroplane and airship contracts came almost simultaneously.

Also the critics forget conveniently that an Armistice is not a Peace, and that though in time of Peace a Government of politicians who are not statesmen may not prepare for war, during an Armistice it is the duty of the War Departments to prepare for a renewal of war. Consequently it would have been criminal to cancel contracts for new and improved machines until Peace was definitely declared.

The Root Cause.

As to excessive deliveries of obsolete machines which were burned as soon as delivered, that is merely a new phase of the old charges brought by this paper against the administration of the R.F.C. in 1915, when quantities of B.E.2cs were being delivered by firms which ought to have been delivering newer and better types of machines. The difference is that after the Armistice the obsolete machines were burned by our own people on the ground, whereas before the Armistice, or at any rate up to the end of 1917 (when the R.F.C. won the Command of the Air), they were sent over the lines where they were shot down and burned, generally along with their crews, by the enemy.

That was in the days when wild enthusiasts charged the R.F.C. authorities with murdering our aviators—charges which apparently amused the said authorities considerably, judging by their attitude at the Air Inquiry.

These murders raised a little interest in the Press, but the financial effect of the delivery of obsolete machines to be burnt with their crews on the enemy's side of the lines was so much less than that of burning more recently obsolete machines ourselves without their crews that no serious agitation was raised. It was not until politicians in and out of the Services saw an opportunity for self-advancement in the formation of an Air Ministry that the imbecility of forming a separate Service with a separate Ministry was considered. And then all the old charges of 1916, together with their sequels in 1917, were raked up to form the Air Ministry in 1918.

That imbecile Act ought to have ruined the Flying Services completely, and it would certainly have done so but for the splendid work done in 1917 by General Trenchard in building up the moral of the R.F.C. and in 1918 by Generals John and William Salmond in sustaining that moral under almost impossible circumstances.

How the relics of the R.N.A.S. held together is a mystery. They seem to have clung onto the Naval tradition. and to have rallied in little groups round their squadron and wing commanders. Certainly they had no support from their senior Naval officers, who were very much too busy scrambling for good jobs at the House of Bolo to bother about what became of the wretched R.N.A.S. seaplane people. And it was very largely this betrayal of the R.N.A.S. by their Naval officers which gave the Germans the command of the air over the North Sea just when the R.A.F. held absolute command over the war areas on land.

Charges False and True.

Now we have the same old superfluity of obsolete machines raked up again for the destruction of the very Air Ministry which an earlier similar superfluity was used to create. But this time we find a difference in the argument.

Then the superfluity was attributed to lack of co-ordination and co-operation between two rival Services. Now it is said, by the "Morning Post," "The charge is that the Air Board subordinated the requirements of the fighting men to the interests of the contractors; and, further, that the same system was continued and carried to incredible lengths by the Air Ministry."

If that sentence means anything it means that the Supply Department and the Technical Department under both the Air Board and its successor the Air Ministry were bribed, or otherwise influenced, to go on ordering obsolete machines so as to save the contractors the expense or at any rate the loss of profit which would be caused by changing over from an old to a new type of machine.

The S.B.A.C. and Graft.

In any case it is a direct charge of graft against British aircraft constructors, and that being so it is the duty of the Society of British Aircraft Constructors to clear the good name of the British Aircraft Industry by demanding an official inquiry into this charge.

So far as those firms which are known as "designing firms" are concerned, one knows that the charge is grossly false. But there may have been "designing" firms, in another sense, of whom the charge is true.

The "designing firms" are those who have maintained a designing staff and who have produced from time to time new types of machines (or engines), which types have been later reproduced in quantities by firms not strictly in the Aircraft Industry at all, but merely manufacturing firms of one sort or another which were dragged in to build aircraft. These designing firms have in fact been the chief sufferers from the foolishness or knavery, whichever it may have been, of the Supply and Technical Departments.

If there has been graft in order to prolong the output of obsolete machines it has certainly not come from the designing firms, who, if they indulged in graft at all, would do so in order to get their newest and best designs accepted.

Fools or Knaves?

One knows enough about the way in which new designs have been held up by the Air Board and Air Ministry to know that the superfluity of obsolete machines has been caused chiefly by the refusal of the Technical and/or Supply Departments to adopt new types which were offered to them. The people who turned down or delayed the new types were either fools or knaves, and it is the duty of the S.B.A.C. to demand an inquiry to prove which they were.

Were they fools or knaves who continued the B.E.2c and its successors the 2d and 2e in production in 1916 and 1917; and who turned down the Sopwith "one-and-a-half-strutter" in the summer of 1915? It was ordered by the French in December, 1915, and yet only one R.F.C. squadron of it was in action on the Somme in September, 1916.

Were they fools or knaves who turned down the Bristol monoplane in the Summer of 1916 and eventually ordered a few which were used in the Balkans (of all places) in 1918?

Were they fools or knaves who turned down the Martinsyde biplane early in 1917, when it was 20 miles an hour faster than anything in the air, and ordered it in quantities *after the Armistice?*

Were they fools or knaves who turned down the "Bantam" B.A.T. late in 1917, when it was miles an hour faster than the Fokker biplane or triplane and twice as strong and manœuvrable? And how did they justify their statement that they could not stand behind plywood for fuselages, in view of the fact that the Germans used little else, and that no B.A.T. fuselage ever gave trouble.

Were they fools or knaves who turned down the twin-engined Dyott and the twin Fairey fighter, and the twin Avro "Pike," each in its day better than any contemporary twin-engined machines?

Were they fools or knaves who washed out the whole programme for fast fighting seaplanes in 1917 and left the Germans the command of the air over the North Sea in 1918?

Were they fools or knaves who neglected the torpedo-dropping aeroplane, which proved its worth in the Dardanelles in the Spring of 1915, and ordered enough *after the Armistice* to destroy a British Fleet in theory with dummy torpedoes in 1919? And how do they justify the escape of the "Goeben" in 1918?

Were they fools or knaves who continually held up new types or changes of types in the de Havilland machines? Which were they who turned down the D.H.1 and D.H.1a, but ordered F.E.2s by the thousand, though inferior in design and performance? Which were they who stopped progress with the D.H.3 in 1915 and revived almost the identical machine in 1918 when it was called the D.H.10?

One could go on almost for ever with similar examples of obstruction, attributable only to foolishness or knavery, and all tending to produce a superfluity of obsolete types. Yet in every case, so far from this action being in the interests of the contractors, it has been directly against their interests. If there has been any undue influence at work on their side it has been in the direction of inducing the authorities to adopt new types.

One knows cases in which normally honest men have gone about trying hard to discover which official could be induced to give a new design or a new idea a fair practical trial instead of turning it down on purely theoretical grounds. If, therefore, there is any charge of graft against the "designing firms," their failure to induce the officials of the Supply and Technical Departments to adopt the newest and best designs seems to provide the best possible evidence of their failure as grafters.

There is, however, another side to the question, and that is whether big firms engaged on producing parts or complete machines of an obsolete type have by one form of graft or another induced the Supply and/or Technical officials to turn down new and improved designs so that they might be allowed to continue their profiteering career undisturbed by changes of patterns, tools, jigs, and so forth. This side of the question might be worth investigating, and as the great majority of the firms who made aircraft or any part thereof during the war are members of the S.B.A.C., it is that Society's duty in their interest, as well as in the interests of the designing firms, to demand an official inquiry into these charges of graft.

One has heard very curious stories of graft among minor firms and minor officials, but one believes that most of the trouble in the bigger matters, such as turning down good machines and engines, has been due to sheer foolishness, especially to that worst of all kinds of foolishness the high and mighty superiority of the scientific theorist over the practical man who merely makes an aeroplane which flies.

This kind of foolishness, as it afflicted the Royal Aircraft Factory (now known as the Royal Aircraft Establishment), and as it still afflicts the kindred affair, the National Physical Laboratory, was probably responsible for more deaths over the lines than was any form of graft.

And, so far as graft is concerned, one believes that the overweening ambition of a few official scientists (so-called) to have their own theories (and so their own supposed abilities) recognised by some official reward or decoration has been responsible for the turning down of more good and new designs than has any other form of graft. For this is a form of graft in that the official scientist or technical official uses his official position, and his consequent social position, to turn down a rival design or scheme and to push his own interests to his ultimate advantage.

On the whole, therefore, one believes that the Aircraft Industry proper has been fairly free from graft. But none the less the charge made in the "Morning Post" is so direct that the S.B.A.C. cannot afford to ignore it. The fact that the charge is made as an attack on the Air Ministry and not on the Aircraft Industry matters but little. The fact that "any stick is good enough to beat a dog with" does not prevent the stick from being made dirty in the process, and it is up to the S.B.A.C. to clean the dirt off the Aircraft Industry in this matter.

Lack of space prevents one to-day from dealing with the effect of the attack on the Air Ministry itself, for after all that is a minor matter, in that any change which is to take place is not likely to happen for a few weeks, whereas the charge against the honesty of the Aircraft Industry is one which affects its international credit immediately. Therefore one proposes to postpone till next week the argument concerning the superfluity of the Air Ministry, or, alternately, of the Royal Navy.—C. G. G.

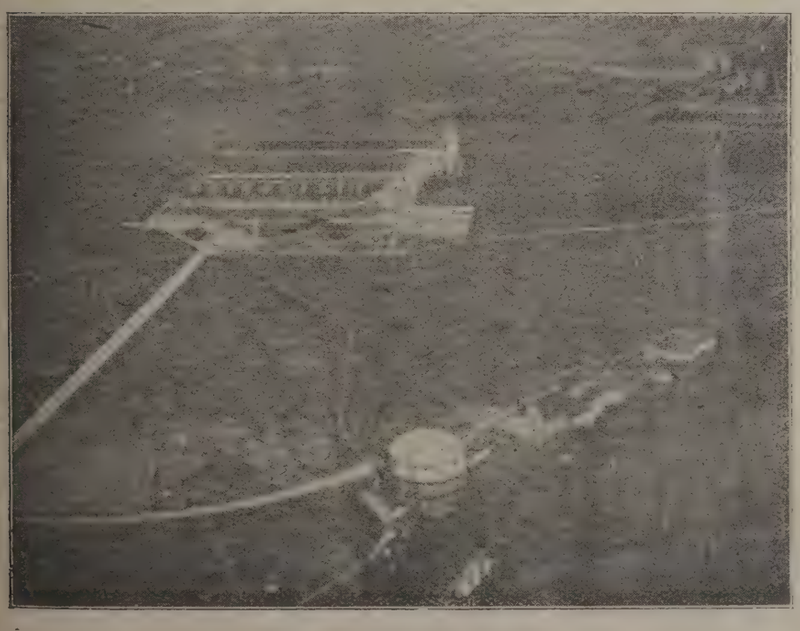
THE BRITISH AERO SHOW OF 1920.

As the following notice indicates, the S.B.A.C. has decided to hold an Aero Show at Olympia, Hammersmith Road, in July of 1920. Apparently the idea in fixing this remote date is that the show shall not be held until everybody in the Aircraft Industry has had an opportunity of producing an aeroplane which is not merely a modified war machine. There does not seem to be any grounds for imagining that the S.B.A.C. is postponing the holding of the show for the purpose of giving every other nation an opportunity of designing and exhibiting new machines and thus securing any possible orders.

One suggests that as it has been decided to hold the show at such a curious date as the one chosen it might have been well to hold it not in London itself but at some more or less accessible aerodrome where it would be possible for exhibitors to have machines flying as well as those which appear on the stands. This notion has possibly something to commend it, on the assumption that the S.B.A.C. does not desire a mere common mob to attend the exhibition, but is solely concerned with attracting millionaires and bankrupts, who appear to be in these days the only people who have any money to spend. One assumes, of course, that it is not the mere vulgar object of the S.B.A.C. to make the show pay for itself as a gate-money concern, as is the custom in the motor trade, for if machines are to be shown adequately at Olympia there will be no room for the public.

If it had been the intention to make the show pay, it would have been obviously more sensible to have held it somewhere in the immediate vicinity of London, either in marquees in Hyde Park, or at a repaired White City, or at Earls Court, or possibly even at the Crystal Palace, which is now considerably more accessible even than the aerodromes at Hendon or Cricklewood. In the event of any visitor to the exhibition having any desire to fly in a duplicate of any of the machines exhibited, it would have been quite possible to convey such a curious person to an aerodrome in an automobile.

It is possible, however, that the special providence which looks after the interests of England may turn the apparent eccentricity of the S.B.A.C. to good purpose in that by next July either the people who have bought the immature commercial machines exhibited at earlier exhibitions abroad may have seen the error of their ways and may be more disposed to buy British machines, or perhaps, by an even kindlier act of fate, there may be another war by July, in which case of course aircraft will be in very great demand.



The S.B.A.C. communiqué reads as follows:—

Arrangements have now been made to hold an important International Aero Exhibition at Olympia in July next. It promises to be the largest and most comprehensive display of aircraft, aircraft engines and their components that has ever been brought together, and should be of particular interest, as it will be possible to show something of the post-war developments in Aeronautics. Every type of machine for every variety of purpose will be represented, and, in conjunction with the indoor Exhibition, it is hoped to be able to make provision for trials and demonstration flights at an aerodrome within easy distance.

Before the war a successful series of aero exhibitions was held by the Society of Motor Manufacturers and Traders at Olympia, the first being held so long ago as 1909. Owing to the growth of the British Aircraft Industry during the war, the aircraft firms have formed a separate body, the Society of British Aircraft Constructors, which comprises in its membership practically every British manufacturer of aircraft, aircraft engines and their component parts, accessories and materials, and this body has entered into an agreement with the Society of Motor Manufacturers and Traders under which the pre-war aero exhibitions will be continued under the joint management of the two societies.

The arrangements provide for the setting up of a joint committee to promote aero exhibitions in the United Kingdom and the use of the exhibition organisation maintained by the Society of Motor Manufacturers for the carrying out of its annual motor and other exhibitions.

The Exhibition offices are at 83, Pall Mall, S.W.1.

The first aerial photograph published since the war of the great Zeppelin Factory at Friedrichshafen, on Lake Constance. The enormous size of the "Airship Halls" may be judged by the size of the ordinary workshops and houses in the vicinity. With usual German enterprise, these works, which turned out the majority of Germany's rigid airships during the war, have been converted to peaceful pursuits, and the first of their peace products, the commercial airship, "Bodensee," built for the Hamburg-Amerika Steamship Company, made her first appearance a few weeks ago.

JOHN PORTE, 1884-1919.

British Aviation has suffered a great loss by the death of Colonel John Cyril Porte, who died suddenly on Wednesday, October 22nd. As was well known, Colonel Porte had been suffering for years from tuberculosis, and his death was due to one of those attacks of hæmorrhage which occurred at intervals.

The history of John Porte is a tragedy relieved by the example of indomitable will and loyalty which he has set to all those who serve the King. Few have suffered more and none have done better work in spite of physical and mental suffering.

A Pioneer of Aviation.

John Porte, like so many of those who have done much to develop Naval aeronautics, was one of the early submarine officers who served under Captain Murray Sueter, the pioneer of submarines, airships, and aeroplanes in the Navy. When stationed with his submarine at Portsmouth, Lieut. Porte, as he then was, constructed, in partnership with a brother officer, a quaint glider with which they experimented on Portsdown Hill in 1909. Thus he is entitled to a place among the pioneers of British aviation.

This glider was peculiar in that it was built for a crew of two, one of whom controlled the vertical steering, or elevators, while the other controlled the lateral path with rudder and wing-warping. The machine was launched from a launching track, more or less in the manner of the Wright aeroplanes, and though it met with disaster early in its career it was a distinctly interesting and intelligent experiment.

THE LATE COLONEL J. C. PORTE, C.M.G., R.A.F.

Shortly after engaging in this work John Porte was invalided out of the Navy with tuberculosis, and left in the Service a high reputation as a capable officer, an able technician, and a skilful navigator. The old hands in the Submarine Service still tell stories of his wonderful work with the primitive A-class boats, especially concerning an extraordinary voyage which he made in a thick fog from the Vickers works at Barrow to Plymouth, rounding the points of the treacherous Welsh and Cornish coasts without sighting land or sun, and navigating entirely by dead-reckoning and his knowledge of tides and currents. It is said that for three days and nights he never left the deck of his little craft.

There is no doubt that the hardships which he endured while on such work as this were the cause of his contracting the disease from which he died. But His Majesty's Navy is not accustomed to take notice of such things, which are all in the day's work, so John Porte was simply invalided out.

A Commercial Venture.

His experiences in the Navy, and his own temperament, a curious mixture of rashness and cool calculating foresight, naturally fitted him for the work of a pioneer aviator. Also it seemed that flying would at any rate alleviate his disease, by keeping him constantly in the open air. Consequently John Porte devoted himself to aviation.

After learning to fly at the Deperdussin School at Bethény early in 1911, he formed the British Deperdussin Company, in which Admiral Fremantle was the Chairman, Mr. Lawrence Santoni (now of the Savoia Company) was a co-director, and Mr. Frederick Koolhoven was chief designer. And on a Deperdussin he was one of the starters in the Circuit of Britain in the Summer of 1911. The first British-built Deperdussin monoplane flown by John Porte put up a very fine performance in the Military Aeroplane Trials of 1912, and would certainly have come near winning the competition but for a defective engine.

Afterwards, when a better engine was fitted, he flew the same machine in various competitions in 1913 at Hendon and proved it to be one of the best aeroplanes of the day. It is of interest to note that this same machine, after lying in store during 1914, was brought out again at the outbreak of war and was taken over by the R.N.A.S.

John Porte flew the machine again, and on one occasion at least used it at night to repel a reported Zeppelin raid. Later it was used as an advanced school machine. Later again it was used by Commander R. M. Groves (now Air Commodore) as a hack, and he flew it all over England and a great deal of France. And finally it was irreparably crashed by another officer somewhere in 1916. One mentions this merely by way of proving John Porte's ability to know a good machine when he saw it.

The Beginning of the Big Boats.

Despite the ability of his firm to make good aeroplanes, they failed to find favour with the Government's "experts," so in 1913 the British Deperdussin Company failed to meet its creditors and was put into liquidation. Therefore as there was no opening for his ability in England John Porte went to America, where he joined Mr. Glenn Curtiss in the task of designing and constructing, to the order of Mr. John Wanamaker the millionaire store-keeper, a vast flying-boat on which John Porte was to attempt to fly the Atlantic.

Mr. Curtiss is the first man who ever flew off water and the first who made a flying-boat. It was natural, therefore, that his experience in this direction combined with John Porte's knowledge of the sea and of aviation in general should produce something novel and good. The original Wanamaker-Curtiss was a twin-engined boat, and flew satisfactorily with light loads, but it failed to lift anything approaching a trans-Atlantic load

CIVIL FLYING

WITH

THE SOPWITH "DOVE" 2-SEATER SPORTING MODEL.

COMFORT AND ECONOMY

The Sopwith "DOVE" is a sporting and utility aeroplane, based, in point of design and general arrangement, upon the famous Sopwith "PUP."

With its fast climb, high-speed, quick manœuvrability and wide-speed range it is an ideal safety-first pleasure aircraft.

of fuel. John Porte proceeded to alter the hull design, so as to make it leave the water more easily, and he installed a third engine.

Though the resulting machine still failed to fulfil trans-Atlantic requirements it was nevertheless a great advance on anything achieved up to that time, and it was in fact the progenitor not only of the various multiple-engined Felixstowe boats, culminating with the "Felixstowe Fury," but also of the United States Navy's "N.C." class of flying-boat, one of which was the first craft to cross the Atlantic by air. Thus John Porte can claim not only to have developed the big flying-boats of which we heard so much during the war, but he can claim, along with his friend Glenn Curtiss, to have originated the type. This fact is proved by the agreement made at the time between Glenn Curtiss and John Porte that the latter was to share in any profits which might be derived from the sale of flying-boats of this type.

Back to the Navy.

Some time before the Wanamaker-Curtiss boat had passed the experimentation stage, the war broke out. John Porte, as an invalid, cast by the Navy as of no further use, was fully entitled to remain in the United States and sell aircraft to this country, or to return to England and become a war profiteer. Such action was not in accord with John Porte's nature.

Without staying to make any arrangements about his personal affairs, without even packing an adequate supply of luggage, he caught the first available boat to England, and immediately on arriving reported for duty to his old chief, Captain Murray Sueter, then Director of the Air Department at the Admiralty. Though Their Lordships of the Admiralty may not be willing in time of peace to maintain a man who is slowly dying of disease contracted while doing the Navy's work, they are ever willing to accept his help in time of trouble, so John Porte was reinstated in the Navy as a Lieutenant-Commander—which would have been his substantive rank had he not been invalided—and was appointed to command as Squadron-Commander the newly formed Naval Air Station at Hendon, and shortly afterwards was promoted Wing-Commander R.N.A.S.

At Hendon his work was to train young civilians to become aviators and to walk in the ways of the Navy. The subsequent careers of those who were trained by him during the early months of the war are the best evidence of his ability as an officer. One need mention no names, but if one were to give a list of the Wing-Commanders and Squadron-Commanders who have done the best work in the R.N.A.S. and Naval section of the R.A.F. it would be found to include an unduly high proportion of John Porte's pupils from Hendon. And it is the distinguishing mark of those who were trained by him that they have maintained throughout their Service careers the highest tradition of the Navy.

During his period of duty at Hendon he took part in the biggest air raid which had taken place up till then, namely that on Bruges, Zeebrugge, and Ostende in February, 1915. As he had to leave his command temporarily to join the raiders one assumes that he did so by way of a change from hard work at home.

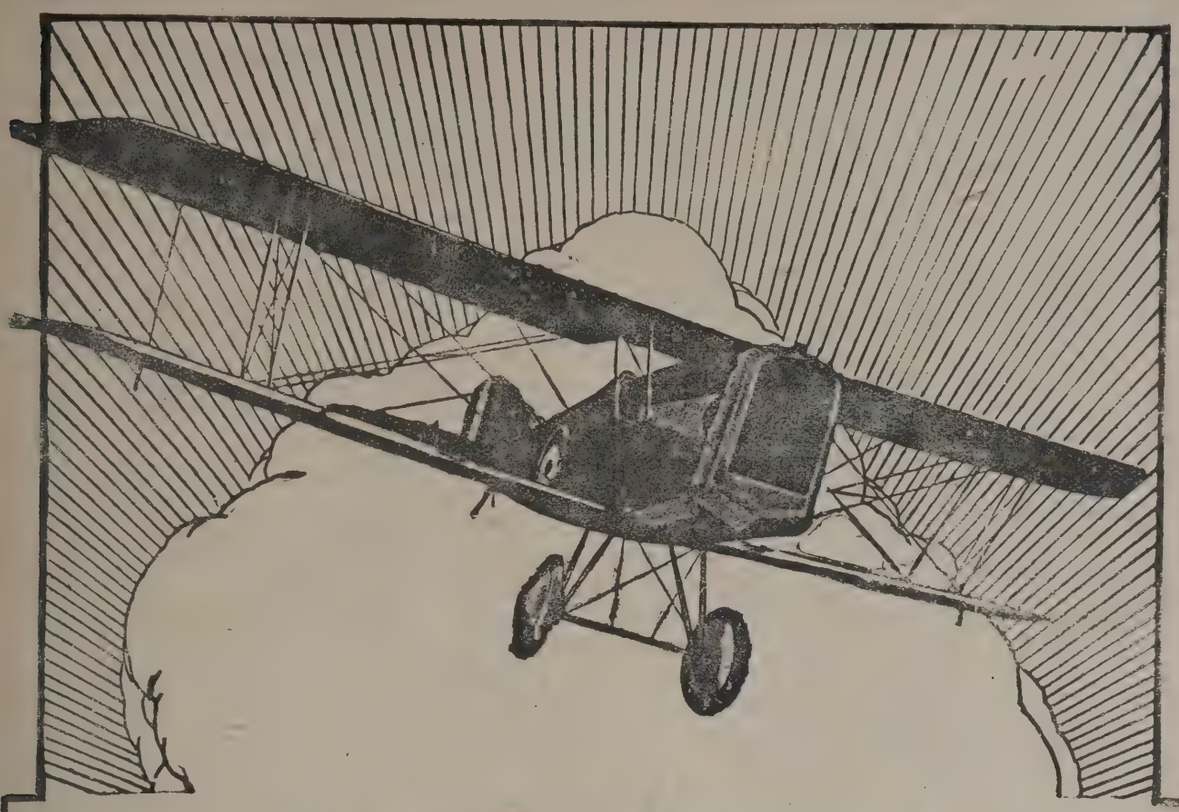
The Big Boat Development.

After some months of excellent work at Hendon John Porte was transferred to Felixstowe to take charge of the experimental work. Here he developed the various types of big flying-boats, beginning with the twin-engined "America" type, and working up through experiments with three-engined machines, to the great five-engined "Felixstowe Fury."

Despite his steadily weakening physique he worked like a slave at his designing and constructional work, and invariably flew the boats himself whenever any radical alteration was made in their design or power-plant. And so by a rapid process of evolution the standard-type "F" boats were produced.

Space is lacking in which to record the work done by these boats, which deserve a history of their own. One can only say that they were of the highest value as anti-submarine patrols, and that such was their reliability and radius of action that the boats from the war stations at Felixstowe and Yarmouth regularly patrolled the Dutch and German Coast right into the Helgoland Bight. Others of the type patrolled the Mediterranean from Malta to Taranto, and thence to Greece, Crete, and Egypt. Also the designs of the boats were sent to America and were adopted by the U.S. Navy for their standard type patrol-boats.

The Prosecution.



It was while he commanded the experimental station at Felixstowe that the great tragedy of John Porte's life came upon him. He was prosecuted by the Government which he had served so well for receiving illegal commissions on war material. The case was fully reported in this paper and was far too long to recapitulate here, but, to put it as briefly as possible, he was charged with taking commissions from the Curtiss Company on aircraft supplied to the R.N.A.S.

It will be remembered that before the war he had an agreement with Mr. Glenn Curtiss that he should share in the profits on the boats which they had jointly designed, and it was this share which the Law Officers of the Crown chose to regard as illegal. John Porte's chief, Commodore Sueter, gave evidence that so far from having influenced the purchase of Curtiss boats John Porte had in fact advised that the R.N.A.S. should have its flying-boats built in England instead of buying them in America. And it was plainly shown that the money paid by the Curtiss Company to John Porte's legal representative (who was also prosecuted) was due on this pre-war agreement, made while the Navy had no use for him.

The Amazing Sentence.

John Porte, on whom the strain of the charge told heavily, producing attacks of hæmorrhage which at one time in the case nearly caused his death, was far too sick a man to fight to a finish, and his legal representative was too old and also too ill to fight, so they pleaded guilty—by arrangement. The sentence was surely one of the most extraordinary in legal history. John Porte was allowed to go free on condition that he returned to the Treasury some thousands of pounds which had been placed to his bank account, but he was allowed to retain £10,000 which had been settled on his wife. His legal representative was fined a sum exactly equivalent to that which he had received from the Curtiss Company on account of the commission due to John Porte under the pre-war agreement.

How the legal mind arrived at such an agreement is a pure mystery. Assuming that John Porte was guilty—as the Crown claimed—the sentence seems to the layman the exact equivalent of allowing a burglar to go free on condition that he returns the majority of his booty. Assuming that John Porte was innocent—as all his friends believe, and as common sense would seem to indicate—then obviously he should have been allowed to retain the commission which was due to him. And in that case the Nation has appropriated some tens of thousands of pounds which by right belonged to John Porte. Either John Porte should have "done time" or he should have died a rich man. There cannot in justice be any halfway course, whatever there may be in law.

Among those who know something of what was going on behind the scenes in the R.N.A.S. it is generally believed that the Law Officers of the Crown were induced to bring the case on insufficient initial evidence, and that when what lay behind it was discovered they were willing to compromise. But in order to save the face of Authority the sick man and his aged friend were made to suffer. And the belief among those who know, as aforementioned, is that the charge was raised for the satisfaction of a private enmity, not in reality against John Porte, but in the hope that a higher officer might be dragged into the case and so be disgraced.

The Service View.

Thus do the innocent suffer for their loyalty. How much John Porte's superior officers thought of the verdict may be gathered from the fact that immediately he was released from arrest—as a man who had pleaded guilty to a grave charge, equivalent to embezzling the Nation's money, and had been compelled to disgorge his ill-gotten gains—he was not only reinstated in his command of the experimental station at Felixstowe, but was given command of the war station as well. Shortly afterwards he was made a Companion of the Order of St. Michael and St. George, and was given a step in rank to full Colonel R.A.F., which was the equivalent rank of a Post-Captain R.N.

One could perhaps hardly find a better example of the difference between Justice as understood by the King's Services and Law as administered by civilian officials.

After-War Schemes.

John Porte remained in command at Felixstowe till after the end of the war. Some months ago he resigned from the R.A.F. and devoted himself to the development of certain very big schemes for the construction and operation of flying-boats.

Everything seemed to point to a great success which would recompense him in some measure for his treatment by the Government. He had collected round him a staff of flying-boat specialists whose value he had proved in the Service. He had made arrangements for production at one of the best works in the country. He had secured adequate financial support. And just when all seemed plain sailing he had another attack and died.

His death deprives British aviation of one of its most far-sighted leaders. Only two or three days before his death he did one the honour of unfolding some of his schemes, and if they are now to be forsaken it will be the worse for the future of flying. It is to be hoped that those with whom he was working, and who have his plans in hand, will be enabled to carry them through, for the future good of this country and as a memorial to the great man who originated them.

Ave Atque Vale.

In his own sphere of activity John Porte was a great man. Like so many other brilliant men who have served the King he was the son of an Irish parson, having been born at Bandon, County Cork, in 1884, when his father was vicar of Bandon. He had all the Irish quickness of wit, and that practical and disillusioned mind which is so essentially Irish.

As an officer and a leader of men he showed the highest qualities. Though he could be sufficiently severe when occasion demanded, he had the Heaven-sent quality of attracting and holding the affection of those who served under him. One has yet to find a single officer who was trained by John Porte who does not look on his period of training as one of the happiest and most profitable times in his life. And one knows that all those who served at Felixstowe when he was in command have given to him unqualified devotion.

Of John Porte's own loyalty one has already spoken, but one may now make known that after the prosecution had been launched against him, and while he was in the eyes of our law-givers a putative criminal, ill as he was he took out one of his big boats over the German Ocean and destroyed a German submarine, so that whatever might betide him in the clutches of the law he would have the satisfaction of knowing that his last act as a free man had been against the King's enemies.

Throughout the war John Porte fought death at home so that he might live to fight the King's enemies abroad. He has died after having seen that victory for which he worked so hard, and on the eve of a new fight for the Command of the Air in time of Peace. One can only hope that his unconquerable will and spirit may inspire those on whom deseends the duty of carrying on his work.

To his widow and to his father all who knew and admired John Porte will offer their respectful sympathy in the great loss which so many of us share with them.

GREAT BRITAIN.
FROM THE COURT CIRCULAR.

ST. JAMES'S PALACE, Oct. 22nd.

By command of the King, Lieut.-Col. Prince Arthur of Connaught held an Investiture in the Throne Room, St. James's Palace, at 11.30 o'clock this morning on His Majesty's behalf.

The following were invested with the Insignia of the respective Divisions of the Orders into which they have been admitted:

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Commander.—Military Division.—Wing Comdr. John Halahan, R.A.F. (also received the Air Force Cross).

THE DISTINGUISHED SERVICE ORDER.—Companions.—Lt.-Col. Alexander Adams, R.E., attd. R.A.F. (also received the Insignia of an Officer of the Most Excellent Order of the British Empire, Military Division); Maj. David Stodart, R.A.F. (also received the Distinguished Flying Cross).

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Member.—Military Division.—Capt. Archibald Smart, R.A.F.

His Royal Highness then conferred decorations as follows:—

THE DISTINGUISHED SERVICE CROSS.—Lt. Edward Cooper, R.A.F.

THE DISTINGUISHED FLYING CROSS AND THE AIR FORCE CROSS.—Maj. Lawrence Wackett, R.A.F.

THE DISTINGUISHED FLYING CROSS.—Capt. Edmund Hardman, R.A.F., and Flt. Lt. Frederick Lord, R.A.F.

THE AIR FORCE CROSS.—Sqdn. Ldr. Alan Duguid, R.A.F.

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointments have been made:—

OCT. 25TH.—Surgn. Lt. (Temp.).—E. R. Peirce, to "Argus" (Oct. 24th).

OCT. 27th.—Payr. Mid.—P. J. A. Moore, to "Argus" (Oct. 25th).

OPERATIONS IN RUSSIA

It was reported on Oct. 22nd that British warships and aeroplanes were persistently bombarding Krasnaya Gorka.

NAVAL REORGANISATION

With regard to the reorganisation of Royal Air Force units operating with the Navy, the following modifications are being made in the home organisation.

All Air Force units working with the Navy, including airships under naval control, will in future be centralised under the command of an Air Force officer, with the title of Air Officer Commanding the Coastal Area (A.O.C.A.), whose offices will be at 4, Thurloe Place, Kensington.

The first occupant of this new post will be Air Commodore Arthur V. Vyvyan, C.B., D.S.O., who for the past six months has been in command of R.A.F. units in the Mediterranean.

The duties of this officer will include the command of all air units in the United Kingdom working with the Navy, with the exception of personnel embarked in ships of His Majesty's Fleet; as adviser to the Lords of the Admiralty in the first instance on all questions appertaining to Naval aerial policy (the Chief of the Air Staff acting as Chief Adviser); and he will also act as adviser to the Naval Commanders-in-Chief at the various home stations. He will be directly responsible to the Air Ministry for the conduct of training, but will keep in close touch with the Admiralty to ensure that the views of the Lords of the Admiralty receive at all times adequate consideration, and he will also be responsible to the Air Ministry on all questions of supply and maintenance of air units working with the Navy in home waters.

The coastal area will be organised into the following administrative groups.

Operational units in home Naval commands, 20th Group, and 10th Group. So far as concerns operational units in the several home Naval commands, these will continue, as heretofore, to work under the orders of the respective Naval Commanders-in-Chief (and thus under the Admiralty) for all operational purposes.

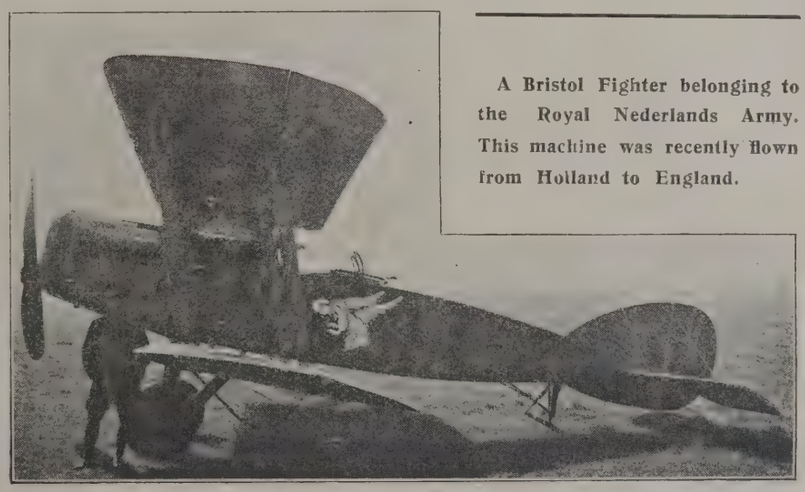
As regards other purposes, they will be under the Air Officer commanding the coastal area. Each Commander-in-Chief will have the senior combatant Royal Air Force officer in his command as his local adviser, but on more important questions of policy he will refer to the Air Officer Commanding the Coastal Area.

The 20th Group will consist of the aircraft embarked on His Majesty's ships and their necessary shore bases and establishments; the organisation of the latter will be based closely upon existing practice. The group commander will have under his command certain bases for supplying the Fleet.

The 10th Group will consist of the Royal Air Force establishments maintained for the training of the Royal Air Force and Naval personnel required by Royal Air Force units or operating with the Navy at home and abroad.

"MEMORIES."

The following passages are taken from the extracts from "Memories" by Admiral of the Fleet Lord Fisher, which has recently been published:—



Somewhere about January 15th, 1915, I submitted my resignation as First Sea Lord to Mr. Churchill because of the supineness manifested by the High Authorities as regards aircraft; and I then prophesied the raids over London in particular, and all over England, that by and by caused several millions sterling of damage and an infinite fright.

I refer to my resignation on the aircraft question with some fear and trembling of denials; however, I have a copy of my letter, so it's all right. I withdrew my resignation at the request of Authority, because Authority said that the War Office and not the Admiralty were responsible and would be held responsible. The aircraft belonged to the War Office; why on earth couldn't I mind my own business? I didn't want the Admiralty Building and our wireless on the roof of it to be bombed; so it *was* my business (the War Office was as safe as a church; the Germans would never bomb that establishment!) . . . .

Recently I fortuned to meet Mr. Holt Thomas, and he brought to my recollection what was quite a famous meeting at the Admiralty. Soon after I became First Sea Lord on Oct. 31st, 1914, I had called together at the Admiralty a great company of all interested in the air; for at that moment I had fully satisfied myself that small airships with a speed of fifty miles an hour would be of inestimable value against submarines and also for scouting purposes near the coast. *So they proved.*

Mr. Holt Thomas was a valued witness before the Royal Commission on oil and oil engines, of which I was chairman (a sad business for me financially; I only possessed a few hundred pounds and I put it into oil—I had to sell them out, of course, on becoming Chairman of the Oil Commission—and what I put these few hundreds into caused a disappearance of most of these hundreds, and when I emerged from the Royal Commission the oil shares had more than quintupled in value and gone up to twenty times what they were when I first put in).

Through Mr. Holt Thomas we obtained the very important evidence of the French inventor of the Gnôme engine—that wonderful engine that really made aeroplanes what they now are. His evidence was of peculiar value; and so also

A Bristol Fighter belonging to the Royal Nederlands Army. This machine was recently flown from Holland to England.

was that of Mr. Holt Thomas's experience; and the result of the Admiralty meeting on aircraft was that we obtained from Mr. Holt Thomas an airship in a few weeks, when the experience hitherto had been that it took years; and a great number of this type of aircraft were used with immense advantage in the war. I remember so well that the very least time that could be promised with every effort and unstinted money was three months (but Mr. Holt Thomas gave a shorter time).

In three *weeks* an airship was flying over the Admiralty at 50 miles an hour ("there's nothing you can't have if you want it enough"), and now we've reached the epoch—prodigious in its advent—when positively the air commands and dominates both land and sea; and we shall witness quite shortly a combination in one structure of the aeroplane, the airship, the parachute, the common balloon, and an aerial torpedo, which will both astound people by its simplicity and by its extraordinary possibilities, both in war and commerce (the torpedo will become cargo in commerce). The aeroplane has now to keep moving to live—but why should it? The aerial gyroscopic locomotive torpedo suspended by a parachute has a tremendous significance. . . . .

The following reports and letter will illustrate this history of my efforts in this direction :—

Lord Fisher returned to the Admiralty on Oct. 30th, 1914.

38 S.S. airships were at once ordered—single-engine type. Six improved type.

Before Lord Fisher left the Admiralty a design of a double-engine type was got out, and subsequently another 32 airships were ordered.

Circular letter issued by Lord Fisher in 1914 when First Sea Lord :—

Lord Fisher desires to express to all concerned his high appreciation of the service rendered by those who carried out the recent daring raid on Lake Constance.

He considers that the flight mentioned, made over 250 miles of enemy country of the worst description, is a fine feat of endurance, courage, and skill, and reflects great credit on all who took part in the raid, and through them on the Air Service to which they belong.

The following *précis* of correspondence is inserted because contributory to Lord Fisher's resignation. He had previously written to Mr. Churchill resigning on the ground of the disregard of his warnings respecting the aircraft menace :—

An official secret German dispatch, obtained from a German source, dated Dec. 26th, 1914 :—

The General Staff of the German Army are sending aircraft to attack French fortified places. Full use to be made of favourable weather conditions for attack of naval Zeppelins against the East Coast of England with the exception of London. The attack on London will follow later combined with the German Army airships.

Précis of History of Rigid Airships of Zeppelin Type :—

Lord Fisher, when First Sea Lord, in December, 1908, instructed Admiral Bacon to press for the construction of rigid airships for naval purposes at the meetings of a Sub-Committee of the Committee of Imperial Defence, which held its first meeting in December, 1908, after many meetings at which Admiral Bacon presented the naval point of view with much lucidity. The Committee recommended on Jan. 28th, 1909, the following :—

(*a*) The Committee are of opinion that the dangers to which we might be exposed by developments in aerial navigation cannot be definitely ascertained until we ourselves possess airships.

(*b*) *There are good grounds for assuming that airships will prove of great value to the Navy for scouting and possibly for destructive purposes.* From a military point of view they are also important.

(*c*) A sum of £35,000 should be included in the Naval Estimates for the purpose of building an airship of a rigid type. The sum alluded to should include the cost of all preliminary and incidental expenses.

(*d*) A sum of £10,000 should be included in Army Estimates for continuing experiments with navigable balloons of a non-rigid type, and for the purchase of complete non-rigid airships and their component parts.

Jan. 28th, 1909.

Approved by Committee of Imperial Defence,
Feb. 25th, 1909.

And nothing more was done till I came back to the Admiralty on October 30th, 1914!

Squadron Dinners.

Nov. 1st.—208 Squadron, R.A.F. (No. 8 Naval Squadron). Applications Mr. F. Hammond, 10, Ashbourne Grove, E. Dulwich, S.E. For officers and men together. Price of dinner without drinks, 7s. 6d.

Nov. 8th.—Isle of Grain Air Station. Café Royale Restaurant, Regent Street. Applications Capt. L. A. T. Pritchard, Wadham College, Oxford, before Oct. 29th. Price of dinner without drinks, 15s.

AIR FORCE.

Service Dress Uniform for Officers of the Royal Air Force.

The Air Ministry announced on Oct. 21st that a new pattern Service uniform for officers of the Royal Air Force has been approved by His Majesty the King.

The change of uniform has been decided upon because it was found that the colour of the lighter shade was not sufficiently durable in wear and was liable to fade. Apart from the colour, however, the only variations from the previous pattern are as noted below :

(1) Substitution of black and blue braid for distinguishing ranks on the sleeve, instead of the present gold braid.
(2) Drab pilots' or observers' badges instead of gold.
(3) Abolition of gold embroidery round peak of cap. The peak of the cap will now be of the same material as the crown of the cap.

Officers will not be required to purchase the new uniform until they need to replace, owing to wear, the blue or khaki uniform now in use, but have been informed that no more of the old pattern uniform should be purchased.

Jackets, trousers, and caps will be made of the barathea, though there would be no objection to whipcord of the usual weights being utilised for this purpose if manufacturers can supply such to the correct shade.

Breeches will be made of cavalry twill.

For the present the existing pattern blue greatcoat may be worn, but steps are being taken to provide a suitable cloth of the new shade.

The remarks relating to the greatcoat also apply to the raincoat.

Patterns of the complete garments and of materials used (cloth, braid, buttons and buckle) can be seen on application to Room 177, Air Ministry, Kingsway, London, W.C.2. The buttons and buckle are the same as on the old pattern blue uniform. Patterns have also been sent to the Chambers of Commerce of the following towns :—

Bradford, Leeds, Huddersfield, Halifax, Galashields, Glasgow, Manchester, London, Trowbridge, and Bristol.

The Sale of an Airship.

Short Bros., Ltd., of Bedford, are at present constructing R.38, which is to be sold at cost price to the United States Navy. It is stated that the price will be £500,000.

According to information received from an official source the airship will be the largest in the world. The following statistics are given :—Capacity 2,720,000 cub. ft. (one-third as large again as the R.34). Endurance at cruising speed 45 m.p.h.—nine days. Length 695 ft. Girth 87 ft. 6 in. Engines—four 350 h.p. Sunbeam "Cossack" and two 275 h.p. Sunbeam "Maori." Gross lift, 82 tons. Useful lift, 50 tons. Maximum speed, 70 m.p.h.

The Royal Air Force Rugby Union Football Club.

On Saturday, Oct. 25th, the R.A.F. Rugby XV made their first appearance against the United Services at Portsmouth, and were beaten after a good game. The score, 27 points to 3, gives no indication of the game.

Fixtures (1919-1920) Season.

Nov. 1st.—R.A.F. v. O.M.T. (Old Deer Park, Richmond.)
Nov. 8th.—R.A.F. v. Northampton. (Northampton.)
Nov. 26th.—R.A.F. v. U.S. (Richmond Athletic Ground.)
Dec. 13th.—R.A.F. v. Swansea. (Swansea.)
Dec. 26th.—R.A.F. v. Bradford. (Bradford.)
Dec. 27th.—R.A.F. v. Leicester. (Leicester.)
Jan. 10th.—R.A.F. v. Northampton. (Northampton.)
Jan. 31st.—R.A.F. v. The London Welsh. (Herne Hill.)
Feb. 7th.—R.A.F. v. Navy. (Not settled yet.)
March 6th.—R.A.F. v. Army. (Queen's Club.)
March 27th.—R.A.F. v. Blackheath. (Blackheath.)
April 2nd.—R.A.F. v. Neath. (Neath.)
April 3rd.—R.A.F. v. Llanelly. (Llanelly.)
April 5th.—R.A.F. v. Ebbw Vale. (Ebbw Vale.)

FRANCE.

A Saint Raphael-Kenifra Flight.

An escadrille of six aeroplanes, under the command of Lieut. Mercourt, will leave Saint Raphael for Kenifra, Morocco, towards the end of October. During the oversea part of the journey the escadrille will be followed by the patrol vessel, "Coccinelle." Landings will be made *en route* at Valence, Tarragona, Santapola, Alleria, Malaga, and Rabat.

A French Air Attaché in China.

The French Government has appointed a French air attaché at the French Embassy in Pekin. The French appreciate the high importance of aeronautical development in China. The land is vast, the communications almost primeval. The stores of unexploited wealth in the country are enormous and the first Western nation to give due attention to Chinese commerce will acquire wealth with ease.

London-Paris
Air Express

Summary of First Nine Weeks' Flying.

August 25th, 1919, to October 25th, 1919.

Flights Scheduled	139
Flights accomplished	135
Prevented by weather	1
Interrupted by weather	1
Interrupted by mechanical defects	2
Number of Miles flown	34,000
Average Speed (M.P.H.)	106

The following is an official summary of the weather flown through during these nine weeks.

Days favourable for flying	17
„ unfavourable for flying	26
„ noted officially as "unfit" for flying	11

LONDON:
AIRCRAFT TRANSPORT & TRAVEL, LTD.,
25-27, Old Queen Street, S.W.1.

Full particulars regarding rates and freights can be obtained from Aircraft Transport and Travel, Ltd., 25-27, Old Queen Street S.W.1, or from the American Express Co., Queen Street and Haymarket; Thos. Cook & Son, Ludgate Circus, E.C., and 38-39, Piccadilly, W.; General Transport, Ltd., 52, Crutched Friars; J. Jackson & Sons, 7-8, Charing Cross, and King William Street, E.C.; Henry Johnson & Sons, 18, Byward Street, and Beak Street, W.; Lepaerial Travel, Piccadilly Circus (Criterion Corner); Carter Paterson & Co., 6, Maddox Street, W., and 3, Cannon Street, E.C.; and Hernu, Peron & Co., 98-100, Queen Victoria Street, E.C.

PARIS:
COMPAGNIE GÉNÉRALE TRANSAERIENNE,
118, Champs Elysées.

THE FRENCH MISSION IN SWITZERLAND.

The French military aeronautical mission accredited to the Swiss Government has returned to France, it duties having been completed. Apparently all questions have been amicably settled.

AVIATION IN MOROCCO.

There are at present about 60 military aeroplanes in Morocco and there will be about 200 in the immediate future. They are used by the military for the conveyance of the sick and wounded, the transport of food, and for isolated posts.

There are in Morocco at present eight escadrille headquarters, 26 aeronautical bases with hangars, and 56 simple landing grounds.

ITALY.

THE ROME-TOKIO FLIGHT.

The arrangements for the Rome-Tokio flight interrupted by the "self-determination" of Signor Gabriele d'Annunzio and Fiume, have now been completed. The following officers will take part:—Lieut. Casagrande (Italian Navy), Lieuts. Ancilloto, Perrarin, Locatelli, and Polisco on S.V.A. aeroplanes, and Lieuts. Bonalumi, Garrone, Negrini, and Scavini on Caproni machines. The route to be taken is as follows: Rome, Gisia del Colle, Sclaica, Adalia, Aleppo, Baghdad, Basra, Chanbar, Karachi, Delhi, Benares, Calcutta, Rangoon, Bangkok, Hanoi, Canton, Foochow, Shanghai, Kiaochow, Pekin, Chefoo (?), Fusan, Osaka, and Tokio. The whole distance is about 10,600 miles.

RUSSIA.

OFFICIAL COMMUNIQUE (ESTHONIAN).

OCT. 26th.—In the Finnish Gulf, in the direction of Krassnaya Gorka, an enemy seaplane was shot down by our fire.

SPAIN.

THE PURCHASE OF MILITARY AEROPLANES.

On Oct. 18th the official gazette published a decree authorising the direct purchase of fifty French bombing machines and forty-six machine guns. One regrets to see so large an order given to other than British firms.

A PRESENTATION AEROPLANE

On Oct. 24th a British aeroplane which had been presented to H.M. King Alfonso was officially handed over at the Cuatro Vientos Aerodrome in the presence of the British Ambassador, Sir A. H. Hardinge and Lady Hardinge.

SWITZERLAND.

The Swiss Government has now recognised the right of the Allied Powers over all German military aircraft and it has been decided that no aeroplane shall be purchased from Germany unless the consent of the French Government has first been obtained.

AN ATTEMPT ON THE HEIGHT RECORD.

On Oct. 23rd the Swiss Military aviator Progin ascended from Thoune in a Swiss-built monoplane with a 200 h.p. engine, to attempt the world's height record. At an altitude of 27,000 ft. the oxygen supply failed owing to a leakage and M. Progin became unconscious. The uncontrolled machine began to descend, but when at 4,000 ft the aviator recovered consciousness and regained control. He landed safely at Thoune after two hours' flight.

U.S.A.

THE TRANSCONTINENTAL AIR RACE.

Although Lieut. B. Maynard led all the way in the Army Air Race his actual flying time exceeds that of some other competitors. Lieut. Pearson's flying time is stated to be 48 hours 37 mins 16 secs. Capt. Donaldson's time is officially given at 57 hours 33 mins. 57 secs. Lieut. Maynard was in the air for 67 hours 3 mins. 40 secs.

THE AVIATION SECTION, SIGNAL OFFICERS RESERVE CORPS.

The following paragraph is extracted from the United States "Air Service News Letter" of Oct. 8th, 1919:—

"Attention is called to the fact that officers of the Aviation Section, Signal Officers Reserve Corps, have been authorised to wear the insignia now worn by officers of the Air Service in addition to the letters "U.S." with super-imposed "R."

A MEXICAN INCIDENT.

A Reuter message from San Diego, Cal., dated Oct. 26th says:—

"It is officially announced that the United States Army aviators, Lieuts. Connolly and Waterhouse, who have been missing since Aug. 21st, were murdered by two Mexican fishermen at Bahia-Los Angeles, Lower California, where the pilot alighted after losing his way during a border patrol flight. The identity of the murderers, who came from a Mexican sloop, is known both to the American and Mexican authorities, and a search is being made for them. The bodies of the aviators arrived here on board a destroyer on Sunday.

"Investigators found messages scrawled on the fuselage of the aeroplane, which showed that the officers were for 9 days without food and were compelled to drink water from the radiator. On Sept 1st the two fishermen, who came from the sloop 'Esperanza,' removed the aviators from their machine, which was floating, and rowed them ashore, where they were stabbed to death during the night of Sept. 1st, probably while asleep Their heads were also crushed. The bodies were found under a slight covering of sand, with portions of their limbs protruding. The Mexicans had looted everything portable from the machine."

THE PITY OF IT.

BY S. F. BENDA.

Five years ago, at the beginning of what afterwards came to be considered by the less thoughtful as a very big war indeed, the English-speaking nations—of course, that excludes America—owned two fairly efficient and thoroughly effective Flying Services. The Great British Nation went to war, and proved its claim to the adjective "great" by the very greatness of its mistakes. The two Flying Services went to the war with their respective parent Services and the senior Flying Service—the R.N.A.S.—was precipitated into a little civil war as well.

It is useless to go over old ground and arouse the memory of old half-forgotten insults, particularly when, if the rumour can be credited, the Navy is about to make amends—truly, it is late in the day to amend anything—but better late than never. The R.N.A.S. was never a favourite of the Royal Navy, but there were faults on both sides, as all who know the inwardness of things will own. Still, even the very worst faults of the R.N.A.S. did not justify the formation of the Royal Air Force.

Because the good must ever suffer for the vices of the bad, the R.F.C. was turned into the Military Branch, R.A.F. Because the sins of the fathers are visited upon the children, the great British Nation—great as ever in its foolishness—looked at the R.N.A.S. and said, "Inefficient! What can one expect when the Navy does nothing?" and the R.N.A.S. became the Naval Branch, R.A.F. Then there grew up that curious conglomeration of sailors, soldiers and civilians, called the Independent Force, R.A.F., which did some quite wonderful things over Germany—and then came the Armistice.

Then the newspapers—short of war copy—looked about for scandal with which to fill their columns, and found plenty of it in the R.A.F. First there was waste. The contracts were too large; there were too many machines; there were too many aerodromes, and too many men keeping them in order. The size of the R.A.F. was too great—there would never be another war, argued the newspapers, forgetful of wars in Russia and Afghanistan, and sundry other places—the pay of the R.A.F. was all wrong. People found things were wrong with the W.R.A.F.

But none saw the real scandal—the real cause of waste—the R.A.F. itself. None realised how much cheaper it is to own two Services, with merely two headquarters, instead of three. And none had the courage to own that what had happened with the W.R.A.F. was merely what one might have foreseen must happen when one took women in the Service and expected them to do men's work in a man's way and so changed their whole outlook on life. One does not believe there is any woman living who is fit for a Service life, for to make a success of a Service career one's Service must come first before all things.

Talking to an R.A.F. officer recently one was told, "We have never been given a chance." That sums up the whole situation.

From the beginning the R.A.F. has had no chance. It is formed of two small pieces of the senior Services who hated each other and themselves, and a third piece of civilians enlisted straight from, theoretically, school, but actually, judging from manners and customs, the street. Ridicule, in the shape of uniforms, decorations and the exaggerated praise of the daily newspapers, has been freely bestowed.

The Air Ministry, with absurd rules, and more absurd "news stories," and utterly ridiculous competitions, has helped to make the Service an object for contempt. Jealousy has been fostered between the three Services in the past by the too liberal pay and allowances of the R.A.F., and although this has now been put right it still remains an imaginary grievance on the part of the senior Services.

Is it much to ask that the R.A.F. shall be given a chance? Even the condemned criminal has a right of appeal, and the R.A.F. has been condemned only by the Press and the Government action. Which is the pity of it.

SUNBEAM-COATALEN
Aircraft - Engines

C.Sec.S. 12093/19

8th August 1919.

Gentlemen,

I am commanded by My Lords Commissioners of the Admiralty to express to you, on the occasion of the safe return of H.M. Airship R.34 from her voyage across the Atlantic, their cordial appreciation of the skill and energy which your Firm devoted to the construction of the machinery.

My Lords would be glad if you would convey their sincere congratulations to all concerned.

I am, Gentlemen,
Your obedient Servant,

Messrs Sunbeam Motor Car Co.,
WOLVERHAMTPON.

ADMIRALTY, S.W.

BOOKS REVIEWED.

SOME SECRET SIDES OF THE WAR.

Readers of this paper will recall various reviews by Mr. Rex Brittain of the works of M. Jacques Mortane, the eminent French writer on aerial warfare, which appeared during the war. None of those books have appeared in English. At last, however, those who are unable to read M Mortane's brilliant little pen-pictures in their original tongue have an opportunity of reading him in a peculiarly excellent translation. Mr. Brittain, having absorbed M. Mortane's spirit by the process of reading his other books for purposes of criticism, has translated his latest work, and has managed to retain in it very much of the Gallic spirit of the original.

The book in question is entitled "Special Missions of the Air." The phrase "Special Missions" has for a long time connoted that peculiarly dangerous class of air work which was concerned with the taking of spies (euphemistically known as "agents") behind enemy lines and with bringing them back when opportunity offered.

In the early days the aviators carried their agents to the wild places of the earth which were nominally occupied by the enemy and landed there so that their passengers might alight. Later in the war the said agents were, as a rule, dropped by parachute, thus, perhaps, reducing the risk to the aviators who dropped them, but by no means decreasing their own risk.

The Work of Heroes.

M. Mortane describes, with that peculiarly graphic style which is his own, the work of various notable aviators who were concerned with these dangerous missions. The late Jules Védrines was one of the first to distinguish himself in this work, and M. Mortane notes how the French populace, with whom Védrines had been a popular idol before the war, were disappointed that he did not show up as a Hun-killer in the early days of the war, little knowing that their idol was in fact doing work of a far more dangerous character than the mere killing of Huns.

Even to those of the R.A.F. who have themselves been employed on similar missions the book will be of very great interest, and to the ordinary devotee of aviation who knows nothing of the actual work of the spy-droppers these vivid stories will come quite as a revelation. M. Mortane's method of telling his stories varies between straight narrative of his own, personal narrative of the spy-droppers retailed at second-hand by himself, and letters from the spy-droppers to their relatives reproduced verbatim. Whichever method he adopts, his story, as translated by Mr. Brittain, stands out as an absolute picture of the events and of the emotions of those who took part in these adventures.

Mental Honesty.

Not only does M. Mortane deal copiously with the work of the French spy-droppers, but he has the mental honesty to give descriptions of similar work by German and Turkish aviators, and he is so free from national jealousy as to give peculiarly vivid accounts of spy-dropping and rescuing by Italian aviators who worked with flying-boats on the rivers behind the Austrian lines. In fact, his account of the work of the Italian Naval aviators is quite one of the most interesting chapters of his book.

One's only criticism of the work is that in the haste of reading proofs so as to get the book through under adverse circumstances as quickly as possible Mr. Brittain has committed a few technical solecisms, as, for example, he allows the French rank of "Adjudant" to be spelled as if it were the British appointment of "Adjutant" and he also allow the machine technically known as a "hydro-aeroplane," or, in French, as a "hydravion," to appear as a "hydroplane," which, of course, it is only in part.

One is tempted to quote largely from the stories in the book, but to do so would be to deprive the reader of the genuine thrills to be obtained from reading how the gallant French pilots landed in and escaped from enemy territory, and how the Italian flying-boat pilots brought away whole crews of spies at one effort on small two-seaters.

Our Own People.

Evidently, the soldierly reticence of our own spy-droppers has prevented M. Mortane from mentioning any British feats in this direction, otherwise one can imagine with what zest he would have described how one Ridley spent weeks in enemy territory, after having crashed his machine in landing a spy, and enjoyed himself by sitting disguised as a peasant on the edge of one of the most important of all German aerodromes watching the machines depart and arrive. With no less pleasure would he have related how a certain Jack Woodhouse spoilt a perfectly good pair of riding breeches by sitting on top of an unduly hot Raf engine changing the plugs which had oiled up while the engine was ticking over on the ground pending the alighting of the spy with whom he had arrived.

Not less entertaining would have been M. Mortane's account of the particularly brave spy whose bravery stopped at parachuting, and who only consented to alight by parachute on the condition that matters were arranged so that he should be dropped through a trap-door unexpectedly and thus would be saved the anticipatory horrors of waiting for the drop. One would suggest that Capt. Alan Bott (otherwise known as "Contact"), when at a loss for a subject for the inimitable "Blackwood," should devote himself to interviewing some of our own spy-droppers and putting their stories on record.

Meantime, those who want to get an insight into one of the phases of the war which has hitherto been of the most secret will do well to read M. Mortane, *via* Mr. Brittain.—C. G. G.

THE DOCTOR AND AERONAUTICS.

[The Medical and Surgical Aspects of Aviation. By H. Graeme Anderson, M.B., Ch.B., F.R.C.S., Surgeon-Lieutenant, Royal Navy, Surgeon, Royal Air Force. Pp. xvi+255 Illus. Henry Frowde and Hodder & Stoughton, London, 1919. 12s. 6d. net.]

When young that branch of literature devoted to the mysteries of medicine had a curious charm. The strange language in which its principles were outlined, the intriguing designs with which it was illustrated, each held attraction for the inquiring brain. After a brief period of study there were few diseases from which one knew oneself to be exempt at the moment of reading. But there was ever an odd joy in the contemplation of a future well spent in diseased living. To those jaded by the horrors of Lyceum drama the attraction of a surgical operation provide a refreshing interlude. When in addition the medical and surgical story is complicated by the intricacies of an aviation accident the excitement is quadrupled.

The science and practice of aeronautics has lacked until recently a treatise dealing authoritatively with the medical and surgical aspects of the aviator's or aeronaut's life. This deficiency has been supplied by Mr. H. Graeme Anderson, M.B., who was during the recent war a surgeon-lieut. in H.M. Navy attached for a long period to the Royal Naval Air Service, and later with the Royal Air Force, to which he is now consulting surgeon.

The late Secretary of State for Air writes a short introduction, and chapters are contributed by Lieut.-Colonel Martin Flack, M.A., M.B., Director of Medical Research in the R.A.F., and Surgeon-Lieut. O. H. Gotch, M.B., Ch.B.

Mr. Anderson begins his work with a brief chapter on medical interest in aeronautics, which is in truth an outline of the history of practical flying both in balloons and aeroplanes. He speaks of the curious effects of height on balloonists. "Madame Blanchard," for instance "suffered from severe epistaxis at 22,800 ft."; also "Gaston Tissandier, Sivel, and Crocé-Spinelli all suffered from altitude effects. Prominent among the signs and symptoms were difficulty in breathing, loss of muscular power, venous congestion, nasal and pulmonery hæmorrhage, headache, vomiting, and torpor."

But the author does not explain how it is that such altitude effects were infinitely more common in ballooning during pre-aviation days than they have been in aeroplane flying. In aviation, in so far as one's personal experience indicates, there is less altitude effect than is common in mountaineering. Possibly psychology can supply a reason.

There are three chapters of high interest devoted to the "Selection of Candidates for Aviation," "The Applied Physiology of Aviation," and "The Psychology of Aviation." In these the relation of the physical and mental is outlined simply and clearly.

Mr. Graeme Anderson summarises so well the aviator's duties in war-time that it is desirable at the cost of space to reproduce the paragraph dealing with this matter. "To realise the value of the standards of fitness required it is well to know something of the aviator's duties in war-time. On the one hand, he has usually comfortable quarters, a good bed and food, and has not to undergo the long marches and discomfort of trench life as in the infantry work. He is usually out of range of enemy artillery fire, although subject to hostile aircraft attack. In weather unfit for flying he has much leisure time. On the other hand, in the crowded hours of his daily work he may come through the most intense strain to which the human nervous system can be subjected.

"As it has been aptly put, an aviator's life consists of 'long spells of idleness punctuated by moments of intense

fear.' He has to face extremes in the elements, intense cold, the sun's glare, rain, wind, fog and mist, and gusty or bumpy weather. There is the incessant noise of his engine; he may have long-distance patrols, in which the imagination is given free play to run riot, perhaps over the sea, with no landmarks, and the dread of engine failure ever present in his mind. His visual acuity is sharpened, always on the lookout for hostile aircraft, watching for and registering the flash of enemy guns, taking photographs, noting movements of enemy troops, rolling-stock, submarines, or other information of naval or military value, and subjected to more or less accurate anti-aircraft gunfire from the ground. Often he has to reach altitudes where the available oxygen is reduced by one-half. He may have suddenly and rapidly to change height, as in the modern aerial fight in which he may be opposing more than one enemy machine. His judgment has to be most accurate to perform the various intricate aerial evolutions so as to outwit his opponent and gain a favourable position to rake him with machine-gun fire. He may have to loop, spin, dive, or sideslip, apparently out of control, in order to deceive his opponent or to decoy him over a friendly gun or near a friendly formation. There is the subconscious dread of his aeroplane catching fire in the air. Lastly, and most exciting of all, is the nerve strain of contour chasing or ground strafing, in which he attacks the enemy on the ground from a low height of perhaps 20 to 50 feet."

The description could hardly contain more truth or be more comprehensive.

He states later that there is a particular temperament for flying, and realises that it is not a quality easily to be clinically estimated. Sluggish mentality is a disqualification for flying. Surgical disabilities, such as the lack of one or other leg, do not in every case prevent a candidate from becoming an excellent pilot. But the stomach should operate with the imperturbable exactitude of a Waltham watch. Trunk injuries are not necessarily a disqualification, and the author implies that he knows three cases of aviators still flying who have fractured their spinal columns, of course without injury to the spinal cord.

He says that the past history of the candidate in the matter of smoking and drinking intoxicants is important and is almost impossible of determination in the examining-room. Neither are really dangerous to the pilot providing moderation is practised. "A history of malaria with recent attacks should be a cause for rejection," as malarial cases rarely do well in aviation, especially in cold countries.

In the chapter on "The Psychology of Aviation" the never-ending subject of "fear" is dealt with at length. There is great difficulty in obtaining any accurate data as to the mental state of the average pilot. Introspection is not a habit encouraged in aviation, yet without it there is little chance of true self-description.

The author in his official capacity drafted a form containing a series of questions to be answered by pupils after their first flight alone. Of 100 pupils who completed these forms none confessed to being without fear, and none admitted that they had nervous dispositions. But little reliance can be placed on any man's statements as to his feelings, else the marriage state would have been less provocative of trouble.

The author emphasises the necessity of sympathy on the part of the instructor. The habit of sneering or of bullying will destroy the remaining nerve of many a promising pilot.

A large part of the book is devoted to the description of aeroplane accidents with details of the surgical difficulties immediately attendant on each. Many illustrations are given of aeroplanes destroyed or in the course of destruction by carelessness or accident.

In a section on the "Surgery of Aviation" descriptions and photographs are given of the fracture of the astragalus, an event common only in aeronautics, and of the effects of "waterbite."

The book is written in English of a degree very uncommon. It appeals not only to those expert in medical science, but to all who have a deep interest in aviation and its problems.—W. E. DE B. W.

A RECORD OF A GREAT SQUADRON.

Already there have been produced a few regimental histories of the war recording in detail the deeds of individual territorial regiments which are not linked to line regiments, some battalions of the New Army have produced histories of themselves, and in the cases of certain line regiments with a distinguished history in the past, that history has been brought up to date to the end of the war. But so far as one has discovered, no individual history of any one squadron of the Royal Air Force has been produced until quite recently, when the annals of No. 100 Squadron, R.A.F., were produced by Major C. Burge, O.B.E., who commanded the squadron at the end of the war.

The 100th Squadron has the distinction of being, in the words of Air-Marshal Sir Hugh Trenchard, who has contributed a foreword to the book, "The first complete night-flying squadron that was sent to the Western Front." It arrived in March, 1917, and was under General Trenchard's command for practically the whole of its time in France, for it remained on the Western Front until October, 1917, when it proceeded to the Nancy area in order to begin bombing Germany.

As to the quality of the squadron, one cannot do better than quote Air-Marshal Trenchard again apropos its services on the German frontier. He says, "There it went through one of the hardest winters we have had, but it kept up its great reputation and increased it. The pilots and observers were always cheery and ready to carry out any work asked of them, and in the worst weather they showed the utmost determination to get to the targets they had been ordered to bomb, very often in thunderstorms, or thick fog and mist. Many times they attempted the work when it was impossible to see the ground from above 100 feet owing to mist.

"The rank and file were noted amongst squadrons for being exceptionally good at keeping their engines and machines in serviceable order. This was not easy, and the men very often worked all day and all night.

"In 1918 it still kept up its great name, and was one of the quickest squadrons I have ever had under my command at learning new type machines when it was re-equipped with Handley Pages.

"I can only say that it was one of 'the great squadrons' of the war, and I was very proud to have had the honour of commanding such an efficient squadron."

Major Burge, in his introduction, says that the book is intended to give all ranks a complete record of the squadron's work, and it is moreover intended as a memorial for those who gave their lives for their country while serving in the squadron. With this object in view, the names and addresses of all ranks who served with the squadron are included in the book with the idea that individuals may be able to get in touch with one another.

A further interesting point about the squadron is that it was originally formed in February, 1917, by Major M. G. Christie, D.S.O., M.C. (later Lieut.-Col. and C.M.G.), who has himself a very remarkable record, being a pilot of considerable antiquity, and one of the very few pre-war pilots who owned and flew his own aeroplane.

The book itself is an actual history of the work of the squadron, into which are interpolated here and there chapters of a descriptive nature which illustrate the history without actually continuing it. Thus, for example, there is a chapter by Mr. "Boyd Cable" on a machine which alighted in Hunland and escaped, there is a series of verses, very much of the "field-service" type, but quite amusing, by Corporal J. R. Bird, there is an account of a short night raid by Lieut. W. A. Barnes, and other matter of a similar nature.

A very interesting section of the book is that devoted to the squadron "operation reports," which contain the names of all those taking part in the various bombing raids and detailed reports of the raids. These reports will be news as well as education to a great number of people. The operation reports are illustrated by a number of very illuminative photographs of the places raided, some of them on the "before-and-after-taking" principle.

Added interest is given to the book by the accounts written by some of the officers who had the misfortune to fall into the hands of the enemy. The list of killed and died makes very depressing reading, but consolation is found in a list of honours and awards won by people serving in the squadron.

After reading the book one is glad to find that No. 100 Squadron is to be included among the permanent squadrons of the Royal Air Force, and one feels that this book will be of the very greatest use in carrying on the war tradition of the squadron in time of peace.

It was originally intended that the book should only be sold to officers and men of the squadron itself, and with this idea in view it has been produced in two editions; an *edition de luxe* at 30s. and another, somewhat more cheaply bound but very finely produced, at 15s. However, the interest in the book is such that it should undoubtedly be in the hands of all those who take a really keen interest in military aviation, for it is not merely a history, it is an informative document on air war. Therefore, one is glad to know that those who are sufficiently interested to pay the price may obtain copies, so long as any remain unsold, at the prices mentioned.

Those who wish to have copies are invited to write to the compiler of the work: Major C. Gordon Burge, O.B.E., at, Dent-de-Lion, Westgate-on-Sea, Kent.

Major Burge deserves hearty congratulation on the way in which the book has been produced, and one hopes that it will not merely pay its way but that it will make a profit, which profit will be applied to other good work in connection with the squadron.

THE AUSTRALIAN FLIGHT.

Capt. G. C. Matthews, Aus. F.C., and Serjeant T. Kay, Aus. F.C., left Hounslow at 11.44 a.m. on Oct. 21st on the Sopwith "Wallaby," with 375 h.p. Rolls-Royce engine. This fact was noted in last week's issue of THE AEROPLANE.

A large number of people, including representatives of the Australian Government and of the Air Ministry, witnessed the start. Numerous messages of good wishes were received by Capt. Matthews before his departure, including the following from Capt. H.R.H. the Prince Albert, K.G., R.A.F., "May good fortune attend you in your sporting flight." Among a small number of postal packets carried was a letter from His Majesty the King to the Governor-General of Australia.

According to the "Morning Post" of Oct. 22nd Capt. Matthews had not decided definitely on his first stopping-place, but would probably land near Paris.

Nothing, then, was heard of the aviators until Oct. 24th, when the Air Ministry issued a statement saying that they had landed at Cologne at 2 p.m. on Oct. 22nd.

Before he started the flight Captain Matthews remarked that the Paris-Lyons-Fréjus route was not the straightest, and that he might make as direct a line as possible across Germany. Although flying over the recent enemy countries is forbidden at present, Capt. Matthews probably thought that it would be within the law to land at the British outpost, the 3rd Wing of the R.A.F. at Cologne.

A Reuter message from Melbourne dated Oct. 17th stated that flying officers had made a survey of the air route from Port Darwin to Melbourne, and that the Australian Navy would maintain a sea patrol between Kupang (Timor) and Port Darwin. Petrol would be available at Port Darwin, Cloncurry, Charleville, Narramine, and along the route thence to Albury and Melbourne.

AUSTRALIAN DEVELOPMENTS.

An interesting visitor to this country at the moment is Mr. H. C. Macfie, a well-known resident of Sydney, New South Wales, and chairman of a new Australian aircraft firm officially entitled, Aerial Company Limited. Mr. and Mrs. Macfie arrived in England a few weeks ago, partly on a holiday, but, one learns from Mr. Macfie, also with the intention of purchasing aeroplanes for his firm, which intends to carry out aerial transport with seaplanes and land machines in Australia.

Mr. Macfie has long been interested in aviation, and it was very largely owing to his efforts that the New South Wales Flying School was formed at Richmond, near Sydney. It will be remembered that Mr. W. J. Stutt, one of the best pilots in this country, went out to Australia early in the war to superintend the work of that school, and it is of interest to know that the school has been so successful under his management that Mr. Stutt himself has now been selected by the Federal Government of Australia to be one of the chief advisers of the Government on aerial matters.

Aerial Company Limited started operations by buying two D.H.6s from the Australian Government School at Point Cook, Victoria, when the coming of the armistice put an end to the training of Australian pilots in quantities, and these machines have been doing very good work in and around Sydney since they were purchased.

The A.C.L.—as the firm is commonly called—is financed by private capital. The managing director is Lieut.-Col. P. W. Woods, D.S.O., M.C., and other directors are: Capt. H. Gilles Watson, D.F.C.; Capt. J. H. Matthews; Lieut. N. P. H. Neal, M.C., M.M.; Mr. G. P. Mann; Mr. Lebbeus Horden (who is himself one of the pioneers of aviation in Australia, having imported a Maurice Farman seaplane somewhere about the year 1911); and Mr. H. C. Macfie, who is chairman of the directors.

Capt. C. H. Chateau, R.A.F., is the firm's aerodrome manager.

Those who know the D.H.6 machine, which, despite its many good qualities as a training machine, is hardly what one would choose for long-distance cross-country journeys, will be interested to hear that after the purchase of these two aeroplanes (Nos. B.2802 and B.2803) they were flown from Point Cook, near Melbourne, to Richmond, near Sydney, the pilot of the first machine being Lieut. R. F. Oakes, A.F.C., and of the second machine Capt. P. G. Taylor, M.C. Owing to the fact that the machines were by no means new, and were probably not in the very best condition, the first machine took seven days over the journey and the second one did not arrive until a week later. All the same, considering that the tank capacity of the D.H.6 is only about enough for two hours' flying, and that the speed of the machine is nearer 50 than 60 miles an hour and that there were no landing-grounds *en route* and that there were no adequate tools or spare parts with it to do repairs, the flight is by no means unworthy of the record of the Australian Flying Corps. As a matter of fact, the actual flying time of the first machine for the 560 miles or so was 9¾ hours.

Besides being used for ordinary "joy-riding," the machines have been used largely for advertising purposes in and around Sydney. For example, the well-known drapery firm of David Jones, of Sydney, acquired much merit by engaging one of the A.C.L.'s D.H.6s. to distribute advertising literature over the city.

The firm have the intention of acquiring hydro-aeroplanes of sorts, whether flying-boats or seaplanes is not decided at the moment, so that the "joy-riding" business may be extended in future to the holiday resorts of Sydney Harbour. Apparently the firm has good money behind it and has a thoroughly efficient flying personnel, and so it seems to have every prospect of success.

Mr. H. C. Macfie is also president of the New South Wales section of the Australian Aero Club, which is affiliated to the Royal Aero Club of Great Britain. In May last the New South Wales section held a special meeting, and a friendly arrangement was made with the older Victorian section of the Australian Aero Club that the two sections should have entirely independent control. Apparently the New South Wales section of the Club is going very well and it now numbers several hundred members. The secretary of the new organisation is Mr. S. J. Hart, whose official address is the Australian Aero Club, New South Wales Section, Box 2516, G.P.O., Sydney.

One of the first of the activities of the newly formed section was to welcome home the squadrons of the Australian Flying Corps which returned to Sydney on June 19th in the S.S. "Kaiser-i-Hind." The returning officers and airmen, who were under the command of Lieut.-Col. W. Oswald Watt, D.S.O., were entertained at a gala performance at Her Majesty's Theatre, Sydney, on June 24th, 1919.

ON BLAZING THE TRAIL.

It has been pointed out by a reader of THE AEROPLANE, evidently a very careful reader, that the article published last week on "Blazing the Trail" did in fact misrepresent the position as regards the Department of Information at the Air Ministry. The Air Ministry communiqué to which the article referred did not state definitely in so many words that the F5 flying-boat which visited Stockholm flew over that city. What the communiqué did make clear was that exhibition and passenger-carrying flights were carried out at Christiania, Christiansand, and Copenhagen, that the boat visited Stockholm as well, and it implied that a good impression was created in each of the Scandinavian capital towns visited. It will, one thinks, be admitted that the communiqué was liable to convey the impression that some sort of an exposition was given at Stockholm as well as at the other places specifically mentioned, especially as the communiqué draws attention to the fact that "in Sweden a natural seaplane highway extends right across the country," and that Scandinavia is perhaps the best market in the world for water-going aircraft.

One tenders one's regrets to the Department of Information for misrepresenting the ideas which it intended to convey, and one hopes that in future communiqués of this nature there will be no possibility of misunderstanding.

It is understood that Major-General J. F. B. Seely, Under Secretary for Air, was to make a full statement in the House of Commons on Oct. 28th regarding the alleged disasters to officers and airmen of the R.A.F. who have attempted to fly from London to Cairo

The Handley Page Company made the following statement to the "Morning Post" with regard to the allegations:—

"If the statements concerning the high death-roll among pilots engaged in flying machines from London to Cairo are correct and a whole series of accidents have occurred, it cannot be wholly due to unfortunate coincidences, but must be caused by some lack of organisation somewhere. It would be interesting to inquire why so many engine failures caused the forced landings to which reference has been made. If, as stated, the rubber connections of various engine parts were deteriorated, it would look as if the engines needed overhaul before their dispatch.

"The lack of competent riggers and mechanics along the routes traversed by the machines may perhaps be explained by the fact that a great many of the personnel have been demobilised. Some inquiry would, however, seem to be necessary in order to find out why one machine, for instance, caught fire near Rome although flown by a very experienced pilot, and also why 30 per cent. of the three squadrons of machines detailed to fly from France to Egypt failed to reach their destination.

"The machines which were used for some of these flights—the twin-engine Handley Page—are of the same type that was so successful in bombing Germany during the war and carrying out the London-Paris-Brussels-service since. As is well known, machines of this kind have flown to Calcutta from England, so that it would appear that there must have been something wrong in the organisation if so many machines failed to reach their destination."

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

The last few months have seen the production of a very considerable number of books dealing with the technical aspects of aeronautics. Some of these works are excellent, and some are appallingly bad.

Several of these works, mostly good, are reviewed below.

The Parnall "Panther," a machine having a number of novel features destined to fit it for the purpose of reconnaissance at sea, using a ship as its aerodrome, is described in this week's instalment of "Modern British Aeroplanes."

A description of French methods of airscrew construction, contributed by a correspondent in Paris, is printed on page 1537 *et seq.*

The two types of plywood construction present features of interest, and this method of construction presents very considerable interest from the point of view of economy in material.

Some details of the Zeppelin giant sea-monoplane are given on page 1524.

SOME TECHNICAL LITERATURE.

Solomon—in the days when literature was yet young—remarked that "of the making of books there is no end"; and Shakespeare—apropos some quite other affair, but quite appositely to the subject of Solomon's prophecy—complained that "this is indeed a bloody business."

Had Shakespeare the advantage of an acquaintance with applied aeronautics, and had he the task of reviewing some of the current technical literature relating thereto, there can be little doubt that the English language would be the richer by a number of adjectives of even more incarnadined purport than it yet possesses.

Yet—though a sore trial to the reviewer—the recent outburst of books dealing with the technique of aeronautics is an encouraging sign. It may be taken as a certain sign of faith in the future of Aviation on the part of both authors and publishers, and the latter class at least are usually credited with some degree of foresight. One would feel even more encouraged by their apparent belief that there is, and is likely to continue to be, a public demand for books dealing with aeronautics from a more or less technical standpoint, if they showed a little more discrimination in regard to the quality of the matter which they publish.

Fortunately a very fair proportion of the recent literature on this subject is quite valuable, and most of the rest of it is quite amusing. The trouble in regard to the latter section is that it is apt to fall into the hands of those as ignorant as the authors thereof, and be taken seriously.

An Extreme Case.

By way of illustration one may cite a little work published by Nisbet and Co., Ltd., at the price of 1s. 6d., entitled "The Aviation Catechism." The author, one Major W. T. Blake, R.A.F. has been responsible for a number of utterances in the Daily Press, under the pseudonym of "Wing Adjutant." In his introduction Major Blake states that "The aim of the author has been merely to answer some of the questions which he has found, *after eight years' flying*, are most frequently asked by those who are interested in aviation but have not an expert technical knowledge of the subject."

The italics are not Major Blake's.

The book, therefore, purports to be a guide to those ignorant of aeronautics, and Major Blake in the passage quoted claims inferentially some technical knowledge and explicitly some considerable experience of aeronautics. Internal evidence in the work itself seems to negative both these claims, for it simply abounds in inaccuracies, often of the most misleading and ridiculous nature.

The following samples of the definitions included in a glossary, for instance, do not inspire confidence :—

Balloonette.—A small balloon forming one of the many divisions of the envelope of a rigid airship.

Bracing Wires.—Wires going from top to lower plane and from front to rear of the planes crossing as a St. Andrew's Cross. They are usually placed between the struts, their purpose being to strengthen the machine.

Flying Wires.—Wires going *from top to lower plane in an outward direction* between the struts, crossing with the landing wires. They do not go from front to rear as the bracing wires. *Their object is to carry the weight of the planes whilst in the air. Sometimes called drift or drag wires.*

Landing Wires.—Wires going from *top to lower plane in an inward direction* between the struts, crossing with the flying wires. Their object is to carry the weight of the planes whilst the machine is on the ground. *Sometimes called anti-drift or anti-drag wires.*

It is worth while to take these four definitions and extract in detail the inaccuracies which they contain.

In the first the general impression given is that a ballonette is a gas container, whereas it is actually an air bag. Secondly, ballonettes are characteristic features of the non-rigid type of airship and are certainly unusual in rigids.

The other three definitions show hopeless confusion. Bracing wire is a general term covering all structural wires, but the author attempts to identify it with what are commonly called Incidence Wires.

The description of the direction of flying wires is somewhat vague, but if it conveys any meaning it means that flying wires occupy the position of what are usually called landing wires. The statement that they "carry the weight of the wings" may be merely a clerical error, but the confusion with drag wires is inexcusable.

The landing wire definition gives them the position of flying wires, correctly states the purpose of landing wires, and makes the confusion with anti-drag wires.

Thus in four definitions there are eight definitely misleading statements.

This is a fair sample of the whole work.

From the catechism proper the following sample may suffice :—

"What is meant by inherent stability?

"Certain machines when properly rigged will, if left to their own devices in the air with the engine running regularly, carry on flying perfectly safely in a straight and horizontal direction. Should the engine be switched off, these machines will drop their nose and find their own gliding angle. This is known as inherent stability and the degree to which a machine possesses this quality is known as its *factor of safety.*"

One must assume that Major Blake really knows no better

and honestly imagines that he is competent to instruct the unlearned in this matter, but it is extremely regrettable that so utterly misleading and valueless a work should have ever seen the light of day.

An American Effort.

"The A.B.C. of Aviation," by Capt. Victor W. Pagé, of the United States Aviation Service, and published by the Norman W. Henley Publishing Co., New York, is a book intended to cover a somewhat similar field to Major Blake's unfortunate lapse. That is to say, that it is designed to give a general idea of the basic principles of flight and of the practical application thereof to the non-technical. This design is carried out very fully and in a manner which calls for little criticism.

The present reviewer, having but a smattering of the American language, hesitates to criticise Capt. Pagé's literary style, but must state that for British students it would be well if certain passages were translated. That, however, is a small affair, and as an instructional handbook for would-be pilots and mechanics the book may be recommended.

An Italian Authority.

In the history of Italian aviation the name of Pomilio has a great position. It is probably not yet well known that in 1918, at the invitation of the Government of the United States, the Brothers Pomilio migrated to that country to assist in the production of American aircraft.

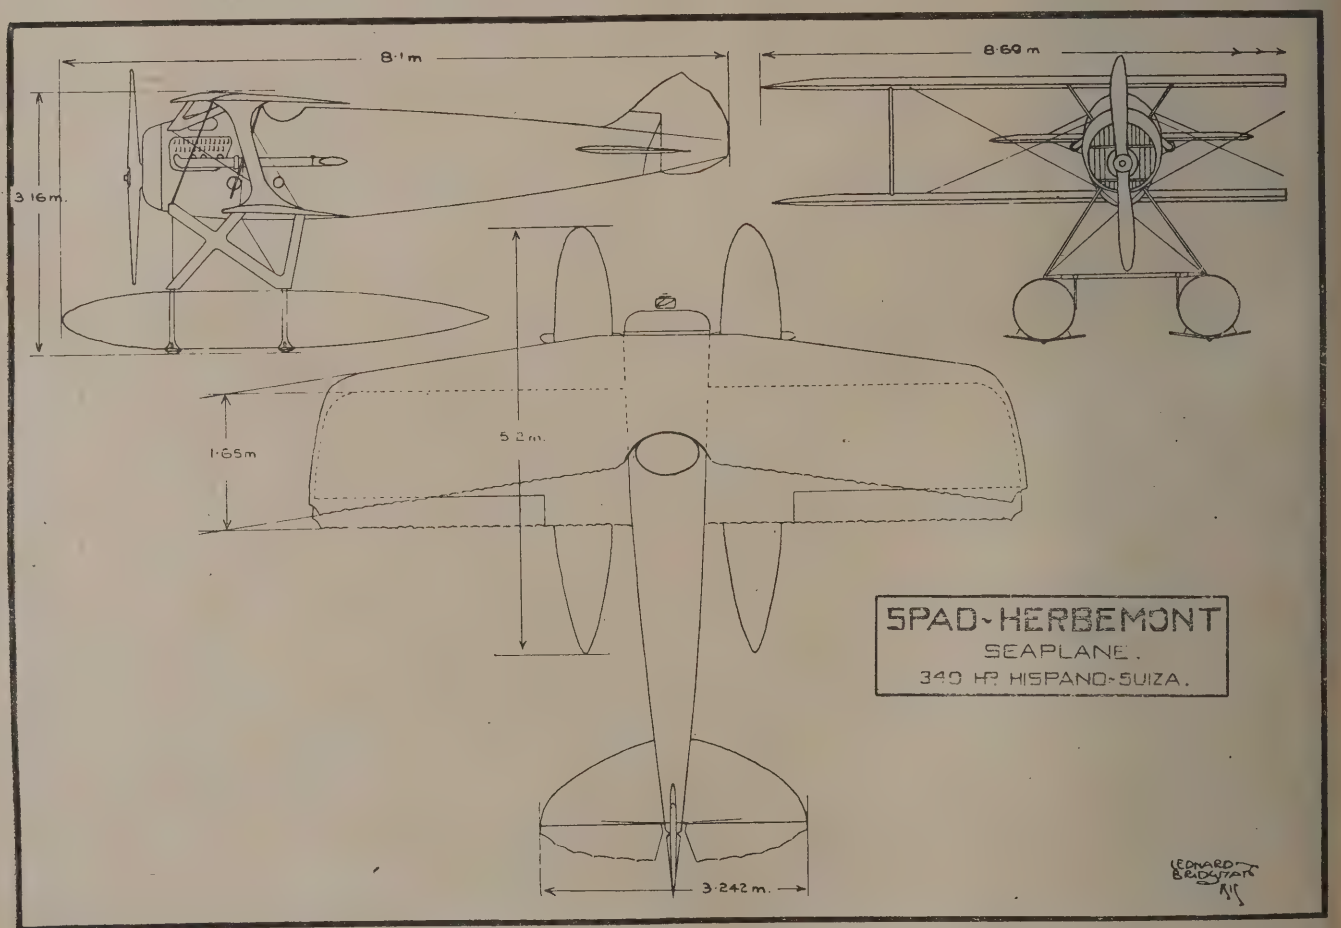
During his residence in that country Signor Ottorino Pomilio has delivered himself of a volume entitled "Airplane Design and Construction."

In this volume the whole subject of aeroplane design and construction is dealt with in an extraordinarily compact form—too compact a form to some extent. The aerodynamic side of the question is handled according to the graphic logarithmic scale method originated by Eiffel—an extremely elegant and very illuminative method which has received too little attention so far in the English-speaking world.

In fact the whole work may be regarded as an essay on the application of graphic methods to the solution of the aerodynamic and structural problems of aeroplane design. It contains nothing of new facts, but is a very clear and lucid exposition of one particular designer's methods, and should be in the hands of all aeroplane designers. Even if it teaches them nothing new it should provide a certain amount of mental stimulus.

"Airplane Design and Construction" is published by the Hill Publishing Co., London, and the price is 30s. net.

Stress Merchants.



During the late war most British aeroplane designers came into contact, at one time or another, with the official stress merchants of the Air Department, Admiralty, or of the Department of Civil Aeronautics, and their successors of the Air Board, and the Air Ministry.

Doubtless their feelings as to these conflicts are by now somewhat assuaged, and in any case they will realise that the experience gained in the departments concerned in this particular matter is enormous and that its publication cannot but be of immense value.

In "Aeroplane Structures," Mr. A. J. S. Pippard, M.B.E., M.Sc., and Capt. J. L. Pritchard, late R.A.F., have collected into a volume of 300 odd pages the results of their experience, during the war, in checking the structural strength of experimental aircraft. The subject is dealt with very thoroughly and, as a complete discussion of the loads which an aeroplane may have to bear in flight, involves a fairly close study of aerodynamics, the book might almost be called a handbook of aeroplane design, except for the absence of performance data.

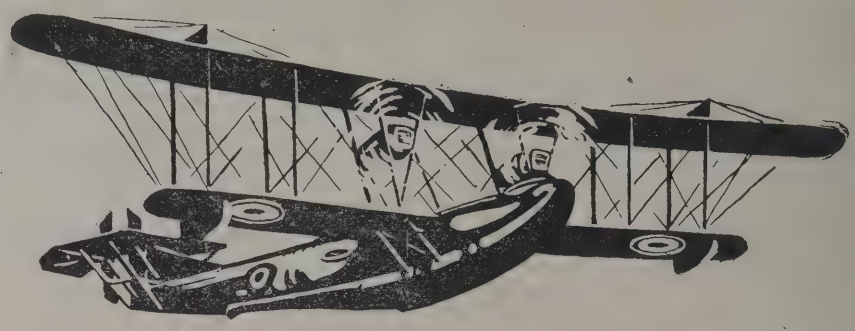
The detail design of parts and fittings are dealt with in a very thorough manner, and the book is one which no aeroplane designer can afford to do without.

The book is published by Longmans, Green and Co. at the price of 2s. net.—W. H. S.

The scale drawing reproduced above shows the Schneider Cup Spad machine as it was intended. The machine which actually appeared at Bournemouth had cut down top wings and pontoon type floats, and was fitted with extra chassis struts to the outer side of each float. The streamline floats, fitted with hydrovanes, shown above, have possibities for very high-speed machines, and it would be interesting to hear why they were not used.

VICKERS LIMITED

THE TRANSATLANTIC FLIGHT
"VICKERS - VIMY - ROLLS"



The first direct Flight from Newfoundland to Ireland (1,900 miles) was accomplished by this Aeroplane in 15 hrs. 57 mins. 4 tons of Petrol and Oil were used.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

MODERN BRITISH AEROPLANES.

XXI.—Parnall and Sons.

The Parnall "Panther" (200 h.p. B.R.2) showing the hydrovane chassis and the airbags inflated.

Parnall and Sons before the war were a well-known firm of shopfitters and cabinet-makers. During the war they embarked on the manufacture of aircraft and turned out many machines to official specification. During 1917 Mr. H. Bolas, of the Air Department, Admiralty, was released to act as the firm's chief aeroplane designer, and was responsible for the "Panther," the only one of the firm's own design of which any information is available. The proprietors of the firm are W. and T. Avery, Ltd.

THE PARNALL "PANTHER."

The "Panther" is a two-seater reconnaissance ship-plane presenting many unusual features.

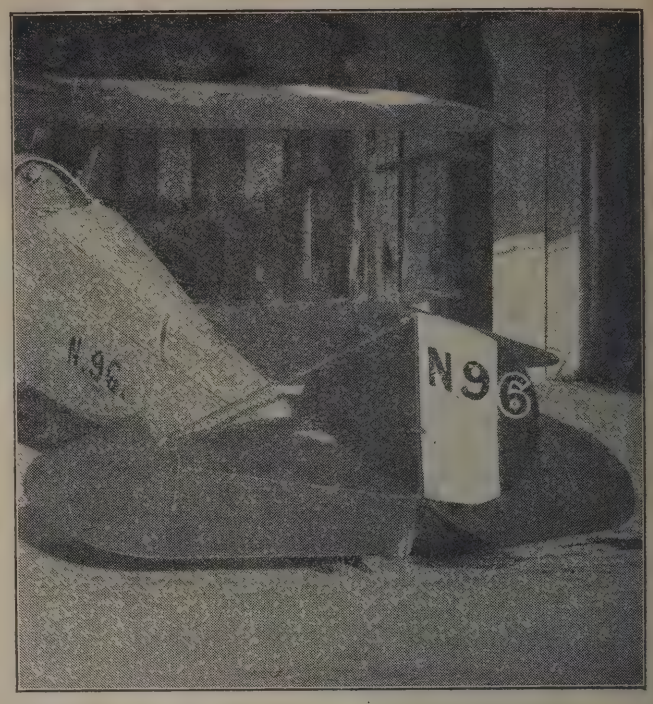
The fuselage is a three-ply and bulkhead affair devoid of wire bracing and arranged to fold just aft of the observer's seat. The two cockpits—pilot under the centre section and observer aft—are within an enormous hump built up from the upper part of the fuselage.

At the rear end of the fuselage the tail is carried, as is customary, but the tail plane is built in a lozenge plan form in such wise as to lie snugly alongside the interplane struts when folded for stowage.

Balanced elevators of very considerable area relatively to the fixed surface, are carried.

The machine is fitted with the "Grain" type of emergency flotation gear, consisting of a hydrovane buffer carried ahead of the landing wheels, allowing the machine to alight on the water, together with a wheel releasing gear to avoid the upsetting effect of wheels when so alighting, and a pair of air-bags normally stowed in a deflated condition along the side of the fuselage and extending from the lower plane rear spar to just behind the airscrew. When about to alight these air-bags are inflated from the pilot's cockpit, the wheels are released, and the machine alights on the hydrovanes and gradually sinks till the air-bags support her.

The Parnall "Panther" (200 h.p. B.R.2) showing the fuselage folded to facilitate stowing. The horizontal rods on the undercarriage are the stowed airbags.



The following specification gives the general dimensions and performance of this machine :—

SPECIFICATION.

Type of machine	Two-seater reconnaissance ship-plane.
Name of machine	Parnall "Panther."
Span	29 ft. 6 in.
Gap	6 ft. 3 in.
Overall length	24 ft. 11 in. (folded, 14 ft. 6 in.).
Maximum height	10 ft. 6 in.
Chord	6 ft. 3 in.
Total surface	336 sq. ft.
Span of tail	12 ft.
Area of tailplane	18.4 sq. ft.
Area of elevators	19.3 sq. ft.
Area of rudder	4.4 sq. ft.
Area of fin	6.85 sq. ft.
Area of ailerons	11.3 sq. ft. each; total, 45.2 sq. ft.
Maximum cross-section of body	14.5 sq. ft.
Engine type and h.p.	B.R.2, 210 h.p. at 1,300 r.p.m.
Airscrew	dia., 2.775 metres; pitch, 2.416 metres.
Weight empty	1,420 lb.
Disposable load, excluding fuel	630 lb.
Total weight loaded	2,560 lb.
Tank capacity hours	4.8 hrs. at 100 m.p.h. at 2,000 ft.
Tank capacity gallons	petrol, 58; oil, 10

PERFORMANCE—

Speed low down	122 m.p.h.
Speed at 6,000 ft.	116 m.p.h.
Speed at 10,000 ft.	111 m.p.h.
Landing speed	40 m.p.h.
Climb—	
To 6,000 ft	6 min. 3 sec.
To 10,000 ft.	12 min. 29 sec.

The Tail Unit of the Parnall "Panther."

THOSE TROUBLESOME NUTS.

Everybody who has had anything to do with internal combustion engines, whether on aeroplanes, cars, or motor-cycles knows that practically every vehicle so driven suffers from the trouble of shedding nuts at unexpected and inopportune moments. Naturally the higher the class of the vehicle the less nuts are likely to fall off, so that it is not every machine to which applies the jest that the makers give away a squirrel to each purchaser, the function of the said squirrel being to run behind and pick up the nuts.

At the same time, the best of workmen and the best of screw-cutting are not guarantees against this disease, which is naturally particularly dangerous in aircraft. Many means have been tried to cure it, the most popular being ordinary spring washers or castellated nuts with split pins. The former depend very largely on the human element in fitting, and the latter are clumsy, unsightly, unreliable and, above all, extraordinary wasters of time and material in fitting.

It is, therefore, the more surprising that all users of such vehicles do not insist on their being fitted with some really reliable nut-fixing agent, such as the "Fastnut" washer, which is now used as a standard fitting by forty railway companies, over sixty colliery companies, and by the London General Omnibus Company. Nothing gets a worse gruelling that does a motor 'bus, and the satisfactory nature of the "Fastnut" washer is proved by the fact that contracts totalling upwards of 1,000 gross monthly of "Fastnut" washers are being absorbed in the manufacture or maintenance of motor 'buses. The figure seems pretty large, but one has the word of Brown Brothers, Limited, for the statement, and as Brown Brothers are the sole agents for "Fastnut" washers for the Aircraft Industry and the motor trade, and as one has known Bown Brothers, Limited, for more years than one cares to remember, one accepts the statement unhesitatingly.

Apart from the fact that the "Fastnut" washer is actually far more reliable and far less trouble than a castellated nut and split pin, it is a great deal preferable in that it saves the excessive length of nut and bolt necessary for the fitting of the split pin. Also with a "Fastnut" washer a bolt locks up wherever it is put so that it is never necessary to strain the bolt by wrenching the nut round an extra seventh or eighth of a turn so as to bring the castellation opposite the hole for the split pin.

Taking it all round, therefore, the "Fastnut" washer works out cheaper in labour and material than any of the ordinary standard methods of fixing. The chief engineer of the United Legal Indemnity Insurance Society, Ltd., writes that, as the result of tests, he is now prepared to make a reduction in the premium for insurance of all engines, etc., fitted with "Fastnut" washers. This is a point which might be very well worth considering by makers and owners of commercial aircraft.

Although it is very seldom that a British aeroplane falls to pieces in the air, one has heard of involuntary descents caused by the disappearance or slackening off of important nuts, and as the rate of aircraft insurance is still pretty high it might be well to consnder the use of "Fastnut" washers as an inducement to lowering premiums.

A NOTABLE ACHIEVEMENT.

In connection with the aerial service between London and Amsterdam two sets of aeroplane landing-wheels and tyres to suit the special conditions of the Dutch landing-grounds were required in a hurry.

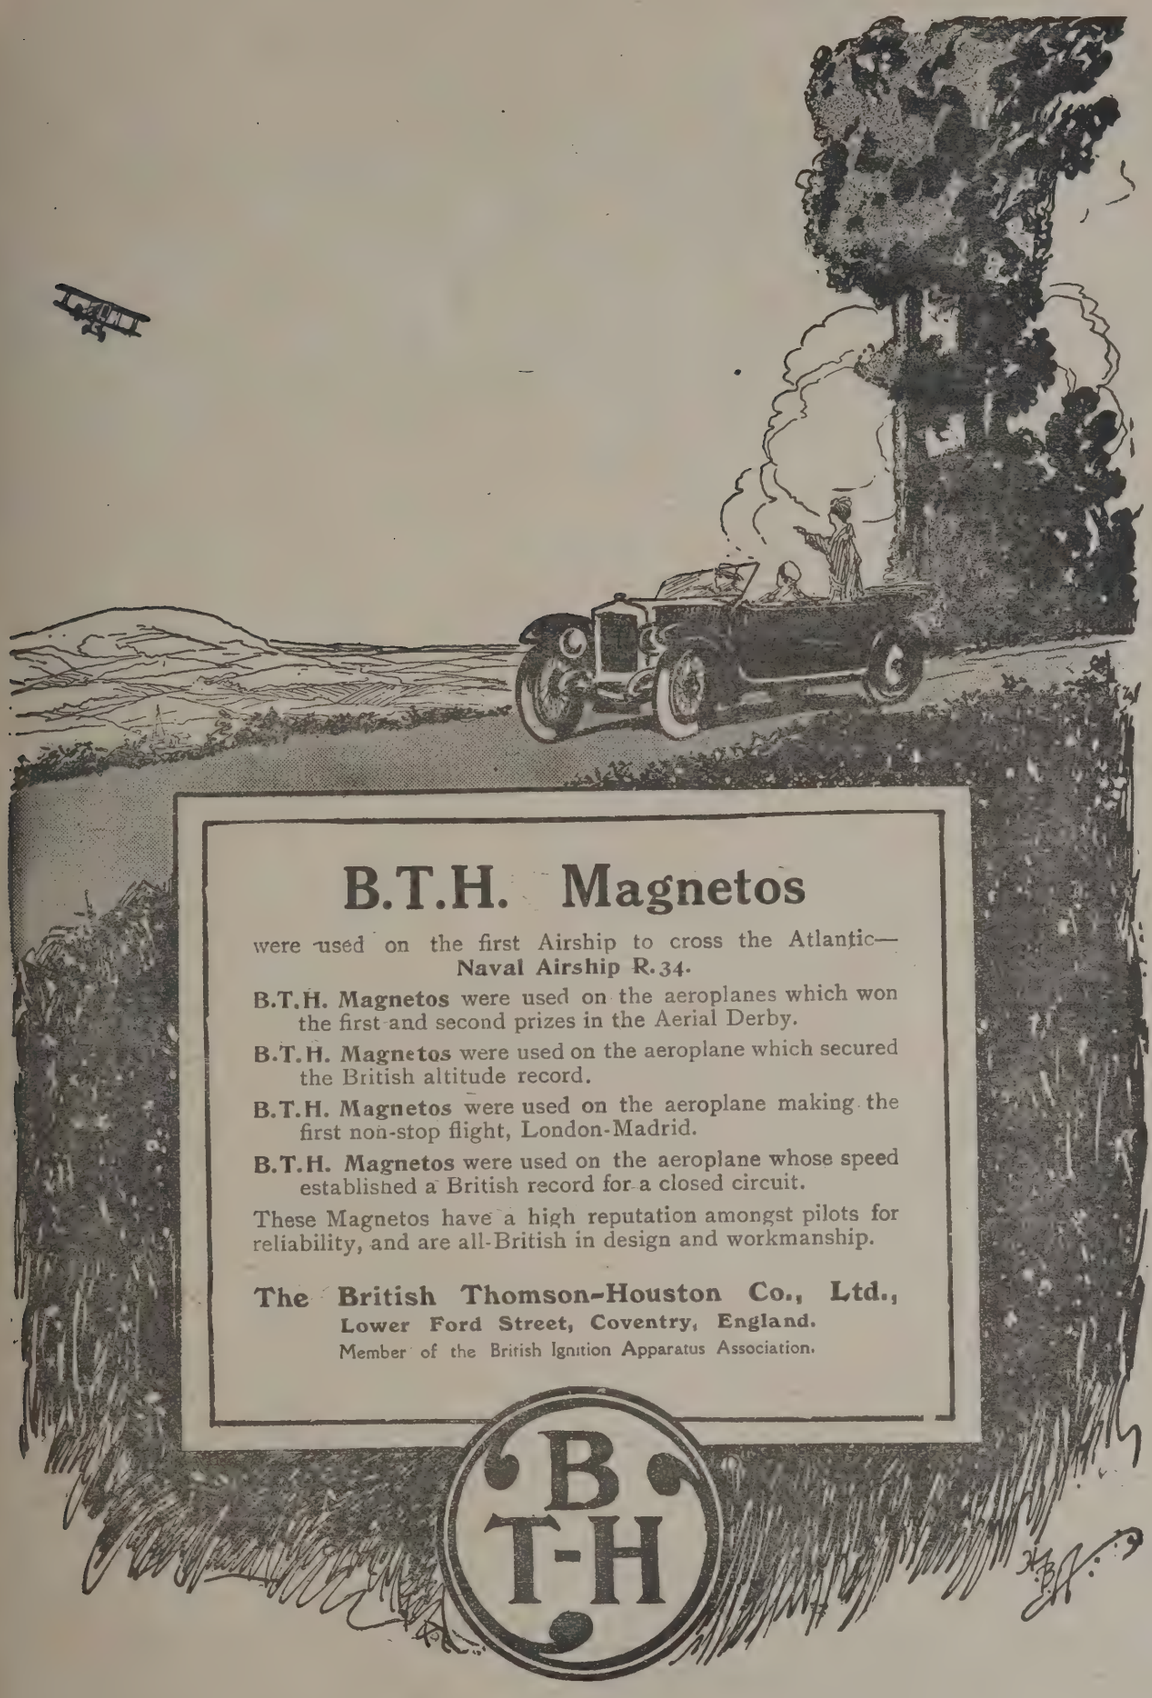
The Palmer Tyre, Ltd (who, it will be remembered, made the landing-wheels and tyres of every bombing and fighting aeroplane that left these shores during the Great War), did not happen to have this particular type in stock in London at the moment, but with their usual enterprise immediately got into touch with their Paris house.

The tyres were handed over to the Paris representatives of Aerial Transport and Travel, Ltd., brought over to London by the next Airco machine, and within five hours these landing-wheels and tyres were ready for fitting to the British Aerial Transport Co.'s machine waiting to proceed to Amsterdam.

TO PATENTEES AND EXPERIMENTERS.

Mr. H. A. Sturch, A.M.I.Mech.E., A.M.I.A.E. (late of the editorial department of "The Car"), has now entered into partnership with Mr. John Walker, and the partners are opening a business as consultants and patent agents with offices at Kenilworth Road, Berkswell, Coventry.

They are prepared to assist in the designing and in the production of the component details of steam-engines, cars, commercial vehicles, pumps, aeroplane engines, etc., and to produce drawings and high-speed tracings under rush conditions. They will doubtless be found useful by firms engaged on experimental work.



CARRYING ON.

It is good to note that at least one firm is going to continue its passenger flights during the winter months. It is the Supermarine Aviation Works, of Southampton, which states that the policy of deciding to carry on during what would ordinarily be called "the off season" will show the public that civil aviation, as far as flying boats are concerned, can be carried on throughout the whole of the year.

A NEW ASCOL COMPANY.

Mr. G. H. Mansfield is about to form two companies, one to be known as the Ascol Company, to deal in motor accessories, aircraft goods, etc., and the other to be known as G. H. Mansfield and Co., to deal with export business. An agreement has already been entered into for doing business in India.

The trade-mark "Ascol" and the goodwill from the liquidators of the old company have been purchased by Mr. Mansfield. As a temporary measure one of the first-floor flats in Ascol House has been taken over for use as offices.

B.T.H. Magnetos

were used on the first Airship to cross the Atlantic—
Naval Airship R.34.

B.T.H. Magnetos were used on the aeroplanes which won the first and second prizes in the Aerial Derby.

B.T.H. Magnetos were used on the aeroplane which secured the British altitude record.

B.T.H. Magnetos were used on the aeroplane making the first non-stop flight, London-Madrid.

B.T.H. Magnetos were used on the aeroplane whose speed established a British record for a closed circuit.

These Magnetos have a high reputation amongst pilots for reliability, and are all-British in design and workmanship.

B T-H

THE ZEPPELIN-LINDAU GIANT MONOPLANE FLYING-BOAT.

The Zeppelin-Landau Giant Sea Monoplane (four 260 h.p. Mercédès engines).

The following information of the German giant naval aircraft is extracted from an article by Herbert Martin in the last issue of the German "Motor," on "The Position of the German Naval Air Service at the Signing of the Armistice."

"The giant aircraft of the Navy were turned out by the Zeppelin works at Staaken-by-Spandau and at Lindau-on-Bodensee, the former being of the well-known land-going type, equipped with four 260-h.p. Mercédès motors in two interplane power eggs (combined tractor and propeller screw drive), and provided with two long narrow floats. No specimen reached the active service stage before armistice was signed.

"Fuel was carried for 10 hours' flight at full power with all engines with a speed of 125 km. per hour, and after four to five hours' flying the aircraft could remain in the air on three engines. The armament consisted of three guns, one being arranged in the nose of the fuselage and one above each engine nacelle in the top plane. The two-centimetre aircraft gun was mounted aft in the fuselage on a swivelling gun-ring. The wireless receiver and sender were arranged in a special compartment aft, which was fitted with a collapsible wireless mast which enabled the aircraft to send messages when resting on the water.

"The monoplane naval aircraft turned out by the Zeppelin-Lindau works (first illustrated in THE AEROPLANE of Dec. 25th last, and in some Allied references called the 'Dornier' model) showed a better performance and improved flying qualities, giving a speed, with full equipment and carrying fuel for 10 hours' flight, of 145 km. with all four engines running at full power, and when three-quarters of the fuel was consumed the aircraft could fly at low height on two engines, thus extending the duration considerably beyond 10 hours.

"The weight of the Zeppelin-Lindau naval aircraft that has successfully passed the seaworthiness tests, amounts to 10 tons compared with 12 tons for the Zeppelin-Staaken model.

"The fuselage was raised above the plane, somewhat similar to the Ursinus biplane.

"The wireless compartment, with receiving and sending plant and mast, is in front, followed by a swivelling gun-mount. The single float may perhaps better be termed a flying-boat, and was made of duralumin, having in the bow an aircraft gun-mount, followed by the pilot's cockpit and fuel tanks. In the stern of the boat is another gunner's cockpit. On either side of the boat two engines were carried in engine nacelles, resting on A-struts and driving tractor and a propeller airscrew. The 260 h.p. engines could be repaired during flight and admittance to the top fuselage was by means of a rope ladder.

"The crew of both types of Zeppelin giant naval aircraft numbered five men. When the war ended improved editions of these models and new types were under construction, but work was stoppel by the Government Departments in question, as no need then existed for their employment in the sphere for which they were designed."—H.

AEROPLANES TO THE RESCUE OF THE MOTOR TRADE.

Owing to the recent strike, the Warland Dual Rim Company found that the material they had forwarded for their display at the Paris Show had not arrived.

It was necessary, therefore, to charter the aid of an aeroplane, and arrangements were made with the Airco Company and all the material was handed to them at 10 o'clock in the morning. At five the same evening the stuff was delivered to its destination. A telegram which was dispatched at the same time, advising their agent of it having left, arrived some 2½ hours after the goods.

Aviation is playing a more important part in industry every day.

A POWERFUL ALLIANCE.

The interesting announcement is made that Handley Page, Ltd., have been appointed sole agents for the sale of Triplex Safety Glass in India, Australia, New Zealand, and South Africa. All inquiries relating to Triplex glass business in the aforementioned countries should therefore be sent to Handley Page, Ltd., at Cricklewood, and not to the Triplex Company.

From this it is evident not only that Handley Page, Ltd., are extending their activities in various directions besides that of merely selling or operating aeroplanes, but that those responsible for the firm know a good thing when they see it.

EQUIPMENT WAREHOUSES.

The Aircraft Materials and Equipment Corporation of New York have completed arrangements whereby they become distributors in the United States of spare parts for Canadian training aeroplanes. These machines were used by the R.A.F. in Canada. Several hundreds have been sold for commercial purposes throughout the country.

The corporation have leased a large warehouse in New York. A complete stock of parts for engines as well as aeroplanes will be kept. A comprehensive catalogue has been published.

A plan has been worked out whereby parts will be sent off on the same day that the order is received. This was done because commercial users of aeroplanes cannot afford to keep their machines laid up for indefinite periods while they are obtaining new parts.

A branch warehouse has been opened at Chicago, and as soon as arrangements have been made another will be opened in San Francisco.

A NEW COMPANY.

W. D. ODDY AND CO.—Private company. Registered Sept. 25th. Capital, £25,000 in £1 shares. To carry on the business of manufacturers of aircraft, heavier- and lighter-than-air machines, propellers and airscrews and accessories, etc., appertaining to aircraft. The subscribers (each with one share) are:—W. D. Oddy, 47, Gledhow Wood Grove, Roundhay, Leeds, engineer; R. Blackburn, Rowcliffe, Boston Spa, engineer. The first directors are: W. D. Oddy and R. Blackburn (both permanent). Qualification £100. Registered Office: Propeller Works, Globe Road, Leeds.

The excellent work done by Mr. Oddy's firm in its original form during the war will be remembered. Oddy airscrews then attained a high reputation which one feels sure the new firm will maintain.

A PRESENTATION.

At a social evening of the staff of the Lang Propeller Works, held on Oct. 9th, Mr. C. A. Laing, the works manager, and his wife were the guests of the evening, and were presented with a handsome clock and an illuminated address in recognition of their silver wedding.

FRENCH AIRSCREW PRACTICE DURING THE WAR.

By JOHN STRONG.

French airscrew practice varied very little from British methods either in design or manufacture, and although quite a large number of patents were taken out during the war only types designed previously were in general use, such as the Chauvière, Lumière, Ratmanhof, Ratier, Levasseur and Régy. For all-round efficiency the Lumière showed up particularly well.

The attached diagram comparing the blade widths of typical British, French, American, Italian, German, and Austrian airscrews is instructive.

TIMBER TREATMENT.

With the exception of the Valéri and de la Grandville systems, 1 in. boards were invariably used for the laminations.

The timbers allowed were the same as in England, but the same amount of old, naturally dried stock was not available, and so the timber was invariably either wet or dry kilned. Elm and beech were treated with Capt. Otto's ozone process, which consisted in alternately passing pure air and ozone-charged air through the kiln at a comparatively low heat.

Kilned timber was usually cut into 27 mm. planks and allowed to stand for a month before using. The planks were then brought into the drying-room and stocked until required. The timber thus acquired the working temperature of the shops.

AIRSCREW WOODS AUTHORISED.

FOR WAR SERVICE.—European walnut, American walnut, beech, mahogany (true), elm, ash, Ban-lang.

FOR SCHOOL MACHINES.—Honduras mahogany, Cuban (tobacco) mahogany, birch (Canadian), African walnut.

AUTHORISED, BUT NOT IN USE.—Oak (Querous Robur), Grand Bassam (mahogany).

MANUFACTURING METHODS.

The planks were slightly warmed in an oven and then planed down to 22 mm. thickness, marked out for the laminations, and roughed out to shape and the preliminary centre hole drilled. The shaped laminations were roughed with a toothed plane.

When building up the blocks great care was taken to balance individual laminations. This made the final working-up very simple.

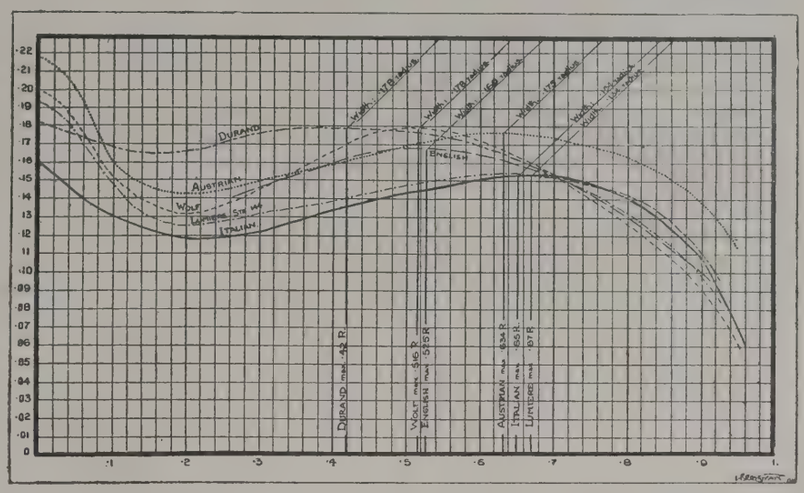
The blocks were then glued up, either hot glue (Lyons and Givet) or casein were used. The casein was preferred officially. Top and bottom gluing boards were used as illustrated, and this allowed four or six blocks to be put into one press, thus economising floor space.

SHAPING.

After taking the block from the press the centre hole was bored to size, and then the block was clamped onto a jig and the blades spindled to the exact profile as seen in plan. While on this jig the boss was also roughed out on another vertical spindle with a concave cutter.

The next operation was facing up the boss, for which a drilling machine with a special cutter was used.

The block was afterwards roughed out on a band saw, for which operation an average workman took about 20 min.



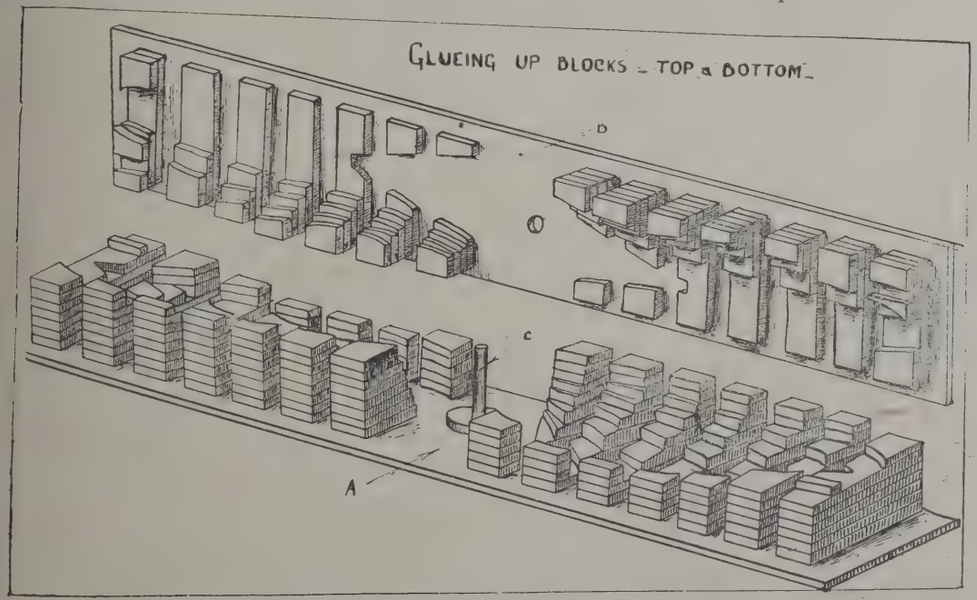


Diagram showing blade width in relation to radius for typical British, French, Italian, American, German and Austrian Airscrews.

for the two blades, both back and face. No marking out was necessary. A succession of cuts were taken until only just the corners of the steps were left in. This only left about 2 mm. to be shaped by hand.

The next operation was shaping out the face and setting the pitch. This was usually done by hand, but in the Lumière shops an ordinary overhand planing machine and a box-jig were used.

The pitch was then initially verified on the test bench and the first cuts taken at the usual sections and verified by templates. The back of the blade was subsequently shaped by hand, using the section cuts as guides. The airscrew was then finished back and face and balanced, either knife-edge or ball-bearing stands being used, and cone mandrels. The bolt-holes were drilled to templates as usual, 1-2 mm. clearance being allowed.

The finished airscrews were afterwards either stained and varnished or lacquered.

The average time taken for hand-shaping after the roughing out on the band saw was less than six hours, and exceptional men only took 2½ hours. Piecework was usual. The labour per airscrew from planing down the planks to final inspection was invariably less than 30 hours, and the workmanship was excellent throughout.

SHAPING MACHINES.

Shaping machines did not come into very general use, as all the British and American machines available cut across the blade and took longer than hand-shaping. An exceptionally good machine was produced by Mr. Wasmer. This shaped

along the blade instead of across it, cutting two at a time, and taking 10 min. per face per blade.

Another good reproducing machine, which also cut along the length of the blade, was the Selmersheim, which is illustrated.

Other Methods.
Eclair.

Timber. — Walnut, mahogany, birch, elm, beech.

Dryness of Timber.—As delivered by French Government and then subjected to tests for humidity. It must not contain more than 15 per cent. or less than 10 per cent.

S.F.A. Timber Inspection.—The Service de Fabrication Aéronautique is equivalent to the British A.I.D. A sample of timber from each batch is sent to S.F.A. having the thickness and width of the laminæ and at least 150 mm. (roughly 6 in.) long.

Heated Chambers.—These are large enough to contain sufficient laminæ for six days' work ahead. Hot, dry air is used (hot damped air is not allowed). Artificial ventilation is employed.

Temperature in Works.—Is never below 65 deg. Fahr. or above 75 deg.

Glue.—Lyons and Givet mixed hot glue or casein if specified.

Period Under Clamp.—Three (3) laminæ under clamps 6 hours; then the two blocks of three laminæ glued together for 6 hours.

Period Before Roughing.—Roughing out is done on band saw, one skilled man roughing 50 airscrews per diem to within 2 to 3 mm. of final. This is done not less than three days after release from clamps.

Period Before Final Shaping.—Twelve days after roughing out the block goes to final shaping, giving 15 days in all after release from clamps.

Centre Bore.—No paint or varnish. Bored a tight push fit.

Bolt Holes.—No paint or varnish. Bored + ½ mm.

Varnish.—Woodfiller, three coats varnish, pumice, French polish, and alternatively lacquer finish.

Levasseur.

Timber Used.—Walnut, mahogany, beech, elm.

How Dried.—Kiln and in heated rooms.

Temperature in Works.—65 deg. to 70 deg. Fahr.

Gluing Room.—Only kept warm by the tables used for heating laminæ, with the result that in the morning in winter the gluing room is rather cold.

Hot Glue Used.—The glue is specially made for Messrs. Levasseur, and is their trade secret. The boards are brushed over with formalin before gluing.

Assembling.—A board 65 mm. thick by 180 mm. wide is used on which the laminæ are applied, and then the whole is clamped by four-sided clamps having three wooden adjustment screws on the top.

Gluing en Bloc.—They apply glue to both sides of laminæ and clamp up the seven or eight laminæ *en bloc*.

Period Under Clamps.—The block is left only 4 *hours* under clamps. They sometimes rough off at once, but usually after 10 or 15 days, and then finish. But the block is always left 15 days between release from presses and final shaping.

Band Saw.—Roughing off is done by one man on a band saw to within 3 mm. of final dimensions—for this the man must be both skilled and efficient.

S.F.A. Inspection.—Examined in the white, directly airscrew is out of shaper's hands, and again after varnishing, as is usual in France.

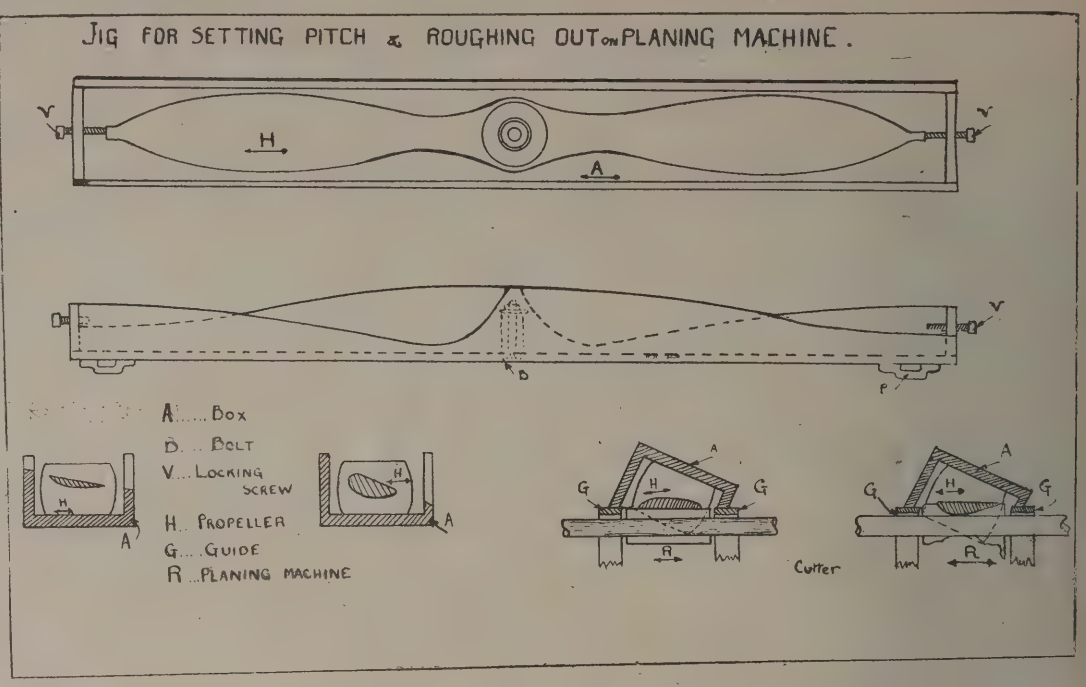
Finish.—Woodfiller, three coats varnish, and French polish. Recently they were lacquered only.

Centre Bore.—Push fit. No paint or varnish.

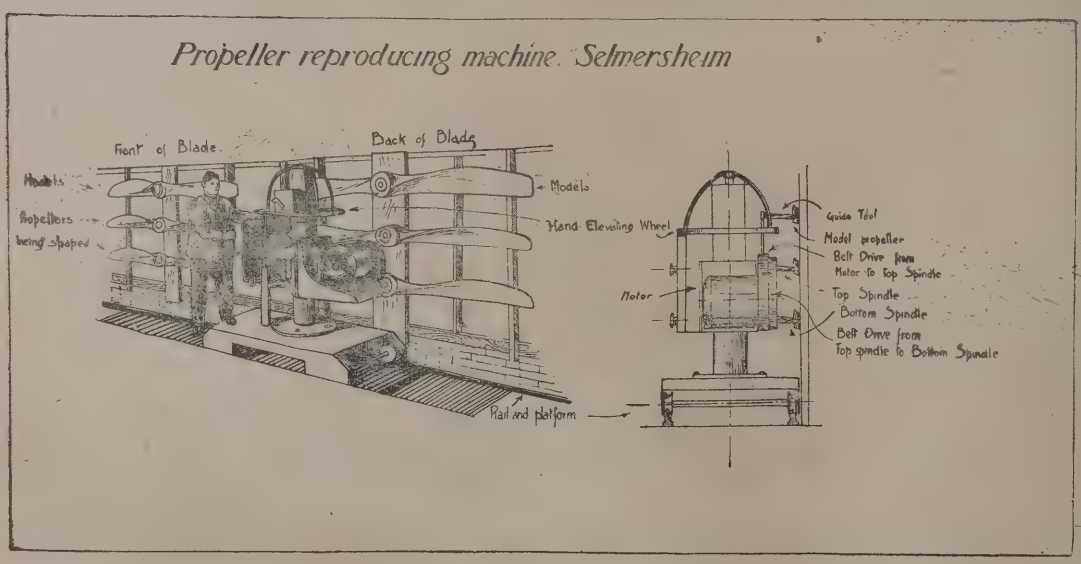
Bolt Holes.—Plus ½ mm. No paint or varnish.

Tipping.—De la Grandville pig-skin tips or ordinary metal tips, following usual French practice.

Regy.



Timber.—Walnut, South of France walnut, mahogany, beech (mostly ozone kiln dried).



Temperature in Works.—65 deg. to 70 deg. Fahr.

Formalin.—Formalin is painted on the laminæ, which are then put into heated chambers for 8 or 10 mins.

Glue.—The laminæ are then taken out and a mixture of hot Lyons and Givet glue is immediately applied, two laminæ at the time.

Clamps.—The usual French type, left on 5 to 12 hours; then pairs glued *en bloc*, 12 hours. Formalin is immediately painted on along the glue joints.

"CLERGET" PATENT AERO ENGINES

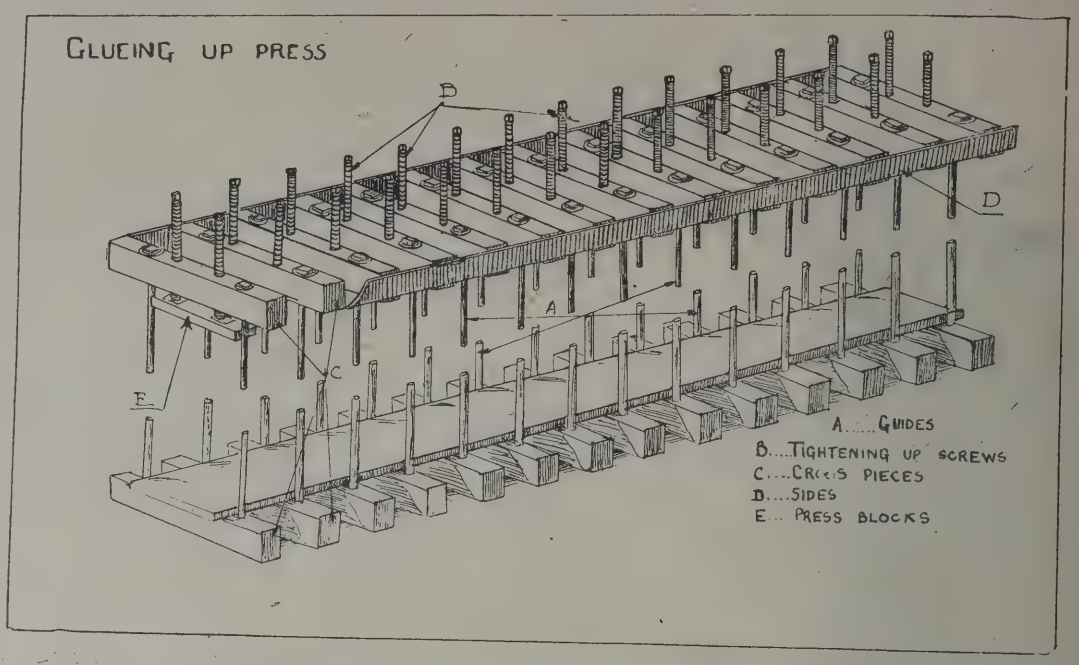
ENGINEERS, LONDON.

"GWYNNE, LONDON." "HAMMERSMITH 1910."

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Casein Glue.—Recently only casein glue has been employed, and airscrews glued up *en bloc* in one clamping up.

Shaping, Roughing, and Inspection.—As in other works.



De la Grandville (Plyboard Construction).

(Société des Hélices Armées et Matricées.)

Temperature. — In the works, 65 deg. Fahr., excepting when first roughing out laminæ.

Air.—Air in works is kept dry as possible.

Timber. — Walnut, mahogany, lime, ash, and others, in 7 mm. laminæ. Face of airscrew in walnut or mahogany. Face pieces of boss in any hardwood.

Laminæ.—Are 7 mm. in thickness and are full length for first four or five from tip to tip. Next full length from sections E to E, next full length from sections D to D, and so on.

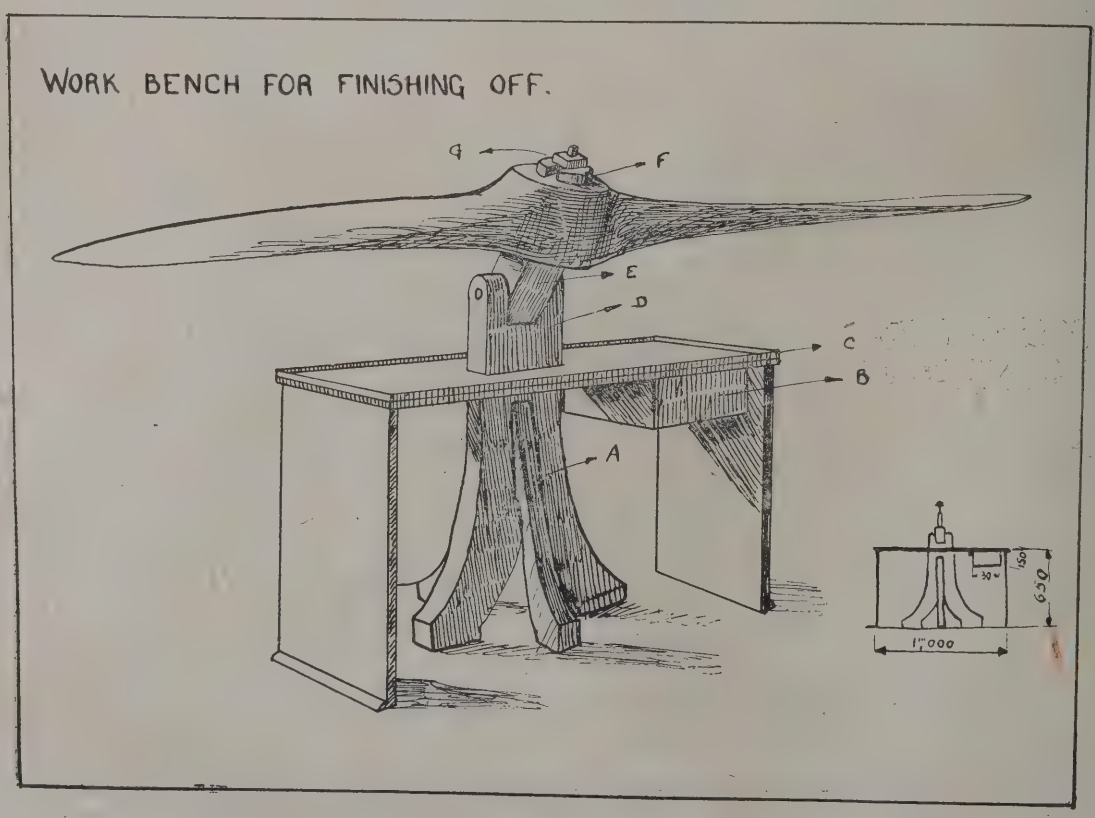
First Stage.—Marking out and sawing of laminæ, to be done as far as possible in a room having a temperature of 75 deg. Fahr.

Second Stage.—Assembling, gluing, and placing of fabric between the first four laminæ to about one-third from tip—that is, only from about section E to tips. Clamping the whole *en bloc* on the matrice or shaping press. Fifteen minutes are allowed to elapse before tightening up the clamps.

Period Under Clamps.—For soft woods two days, and for hard woods three days. The glue used is casein, make R.G. The preparation of this glue requires no special installation, being used cold. Care is taken to brush off all glue oozing out of the sides of the laminæ after a lapse of one hour under clamps.

Third Stage.—Removing block from matrice or shaping press, checking alignment and centre of airscrew, drilling a preliminary hole of 50 mm. diameter in centre of boss. Ten days are allowed for block to dry after release from clamps.

Fourth Stage.—Gluing onto the boss of hardwood packing pieces, if necessary. Two days under clamps. Five days drying after release from clamps.



Fifth Stage.—Squaring the hub, drilling centre bore and bolt holes to size.

Sixth Stage.—Tracing and roughing out on band saw. Three days allowed for 5th and 6th stages. Ten days left to stand after roughing before shaping.

Seventh Stage.—Shaping, etc., balancing, and S.F.A. inspection. This takes from eight to ten hours in all.

Eighth Stage.—Tipping or beading with specially prepared "pig-skin" parchment, without screws or rivets, with special hot "Bugaline Glue." Three days under clamps. *Note.*—If the pitch of an airscrew has dropped, or *vice versa*, at the tip, it is claimed that this can be rectified and made to keep correct for an indefinite period by the application of this pig-skin clamped on by jigs having the required pitch.

Varnishing.—Woodfiller was used and three coats of varnish, pumiced down, and French polished. Recently all airscrews were lacquered instead of varnished.

Valeri (Plyboard Construction.)

The Valeri system of manufacture would have been very interesting if the timber scarcity had been more severe. It allowed 30 airscrews to be made from a cubic metre of timber instead of only six, and called for no special skill or plant.

Thin veneers as used for three-ply were employed, and disposed :—

One layer with fibre along the airscrew blade.

One layer with fibre at 45 deg. to the left.

One layer with fibre straight.

One layer with fibre at 45 deg. to the right.

One layer with fibre straight, etc.

The outside boards for the boss were of

hardwood, but any timber excepting elm could be used for other layers. Either casein or hot glue could be used.

The top and bottom boards of the press could be shaped so that when dry the blade is already nearly to pitch. This saves a lot of cutting away. When hot glue was used water-heated presses were employed.

The strength of these plyboard airscrews is equal to ordinary construction, and when properly made there is no tendency to lose pitch even after long service.

The table herewith gives an idea of the timber required to make an average airscrew by the various methods.

COMPARISON OF THE THICKNESS OF BAULK NECESSARY TO MAKE A NORMAL AIRSCREW.

Laminations.	Ordinary English Method.	De La Grandville.	Valéri.
Sawing	1 mm.	2 mm.	0
Thickness	25 mm.	10 mm.	2 mm.
Planing down ...	4 mm.	3 mm.	0
Finished Plank ...	21 mm. thick	7 mm.	2 mm.
Thickness of normal Airscrew	147 mm.	147 mm.	147 mm.
Loss for seven Laminations	35 mm. per 21 lm.	105 mm.	no loss in sawing & planing.
Thickness of Baulk necessary to make a normal Airscrew	182 mm.	252 mm.	147 mm.

Tipping.

Seaplane airscrews had their blades protected with copper sheathing, following British practice, with the exception that instead of fitting a long length of metal the tip was divided into 8 cm. lengths with 1 mm. between the pieces. This allowed the blade to give a little and avoided the corrugation of the metal which was otherwise common.

Recently land-machine blades were also tipped, but with "Grandville" pig or calf parchment. This was to prevent splitting after being hit, and therefore corresponded to the fabric used on British airscrews.

Lacquering.

Since lacquering has been adopted, tipping has been abandoned as unnecessary.

The lacquer used is the usual "Japanese" gum, supplied from French Indo-China in large quantities. The gum is allowed to settle in barrels, the heavy precipitate being the least valuable, and it is used mixed with a kind of Fuller's earth for a woodfiller. When this coat has dried it is well pumicestoned down and the second coat, consisting of pure gum of the middle gravity, is applied. This is given at least a day to dry and is also pumicestoned before the third coat is applied. This consists of the best of the gum and has mixed with it the necessary colouring matter.

All the coats are applied not with a brush, but with a flat wooden instrument shaped like a putty-knife.

The lacquer finish is hard but flexible. It is not affected by acids, seawater, spray and sand, gravel or the like, but at the same time gives to the whip of the blade without flaking or cracking. Indeed, the process is also used for the mudguards of motor-cars and for insulating fine copper wire for electrical machines for this very reason.

Lacquering gives a beautiful finish for less expenditure than varnishing and polishing.

Dihedral.

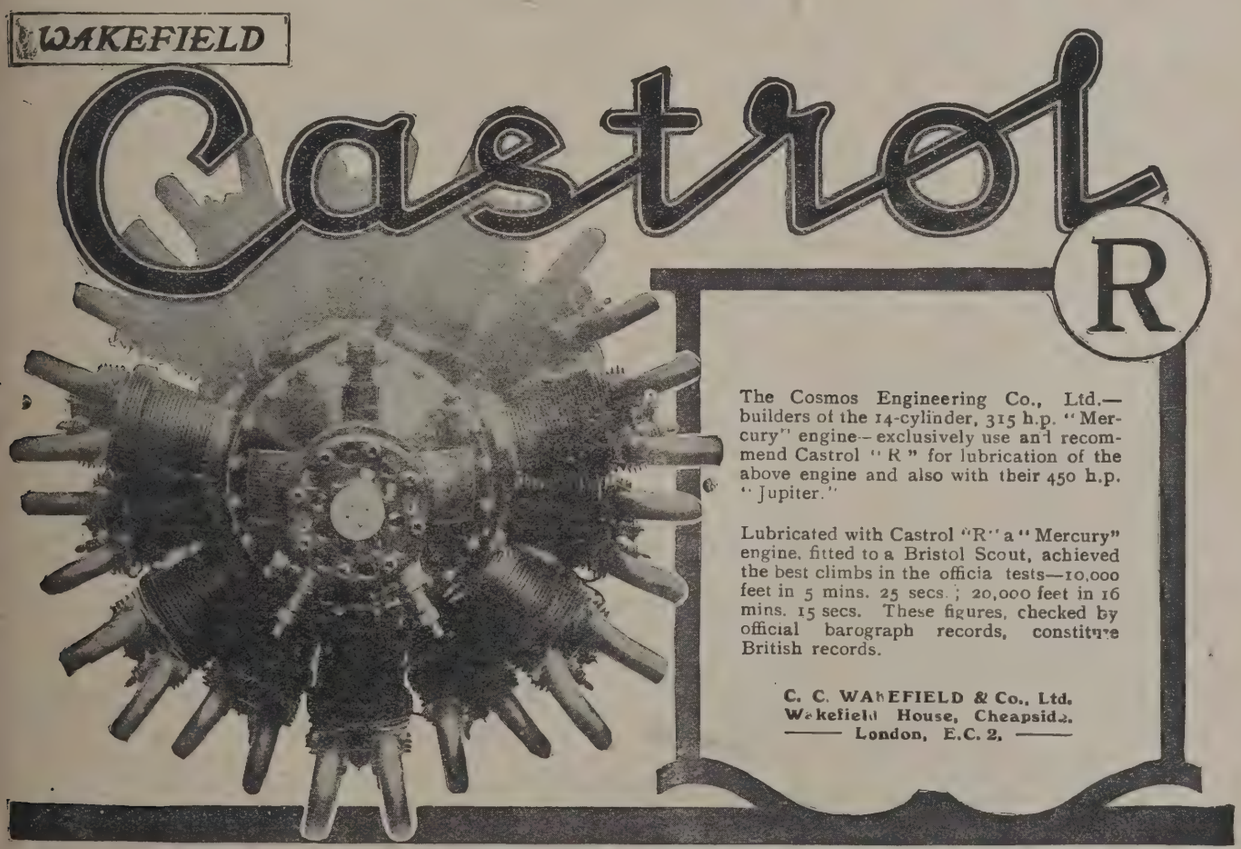
Two designers, Levasseur and Lumière, departed from orthodox practice in giving a slight forward dihedral to their blade to balance correctly the centrifugal and bending stresses on high horse-power airscrews. Unlike British designs, they had constant pitch blades.

Variable Pitch.

The development of the Ratteau Turbo-Compressor and other systems of maintaining engine power at altitudes has led to a lot of interesting experimental work, but nothing definite has yet been evolved.

Mr. L. de Monge, the designer of the Lumière airscrew and Mr. Desmons are working up a patent of the latter to obtain the same result without a variable pitch airscrew. The proposal is to have two two-bladed airscrews, one for getting off and climbing to 15,000 ft., and the other for operating above that height. The altitude airscrew would be free during the first part of the climb, and be brought into action when required by a special clutch, thus converting a two-blader into a four-blader at will.

Several attempts were made to produce pusher machines with fuselages, but they were never quite successful.



There has really been very little to choose between French and British airscrew design. If anything, the light-weight, flexible French type was a little more efficient, and certainly cost much less to make. The joints and the concessions as to methods of manufacture allowed to makers by the Technical Authorities were practically the same as in England.

What flying has taught us—
The demand of the aeroplane for the utmost power from the lightest and most trustworthy engine, and our concentration on that problem, has taught us much—and each owner of the new Austin "Twenty" will benefit thereby.
More power with less weight and greater reliability combined with silent running, flexibility and marked economy are characteristics of the new Austin "Twenty" and assure its selection by discriminating motorists.

A TEST OF ALCOHOL FUEL.

According to a message from Washington, one hundred and thirty gallons of alcohol were brought into Washington by a mail aeroplane of the Post Office Department recently. The aeroplane flew 3,000 ft. over the heads of the excise officers and policemen on the look-out for what are known as "bootleggers." The alcohol was not carried in the mailbags, which would be in violation of the law, but in the fuel tanks, nor was it peddled around in the haunts of the bootleggers after its arrival. The proper thirst for this character of alcohol has not yet been cultivated. It contains a fair percentage of benzol and enough ether to give it additional kick.

The aeroplane which brings in this alcohol every other day is known among the air mail pilots as the "Bootlegger," and is the forerunner of a revolutionary change in the motor operation of the Air Mail Service. This product is the new alcohol fuel which takes the place of the high-grade aeroplane petrol. After a number of tests with this new fuel under adverse weather conditions, the Post Office Department is changing over its aeroplane engine attachment and will shortly be operating the entire New York-Washington route with the alcohol fuel.

Its great advantage lies in the cleanliness of the engine, reducing cost of upkeep, and in its burning cooler than gasoline, thereby overcoming objections to the high compression engine at low altitudes. Engines which ordinarily are 25 to 26 gallons of petrol operate on the new fuel on about 20 gallons, which gives greater flying radius to the machines. It reduces chances of forced landings by keeping the sparking plugs and the engine cylinders clean of carbon and oil accumulations. With this fuel it will be possible to operate the mail in a De Havilland 4 regularly in a non-stop flight from New York to Cleveland, a distance of 430 miles, whenever fog or rain conditions in the mountains make it inadvisable to attempt to land at the intermediate field at Bellefonte, Pa.

A CORRECT DIAGNOSIS.

Apropos the Schneider Cup race it is gratifying to observe that the French journal "L'Air," in its report of the occurrence, states that it is glad to believe that those who know the British people will not accuse them of intentional discourtesy to the foreign competitors, but will realise that it was merely the organisation of the competition which was in fault.

AN INTERESTING MOVE.

Those who like to have news of the pioneers of aviation will be interested to hear that Mr. C. Compton Paterson, who was certainly one of the first men in England to build and fly his own machine—as he did at Freshfield, in Lancashire, in 1910—and who afterwards, with Mr. Guy Livingston (now Brigadier-General and C.M.G.), organised the first introduction of aviation to South Africa, is now organising the output of Skootamotas in the Isle of Wight.

It will be remembered that Mr. Paterson was responsible for the building, equipping, and manning of the factory erected by J. S. White and Co., of Cowes, on the high land above the town, and that while there he managed to produce an extremely creditable number of Short seaplanes with hands which had to be trained on the spot. This factory has now been taken over by Gilbert Campling, Ltd., for the manufacture of Skootamotas, and Mr. Brown, of that firm, is busily engaged with Mr. Paterson in reorganising the factory for rapid production on the most approved modern system.

When in the Isle of Wight recently one had the opportunity of going round the factory and studying the methods which are being laid down for production Though simplicity itself in operation, the system is in fact far too elaborate to be described in print, apart from the fact that the firm might not like to have its own particular system made public. One can only say that the organisers do not seem to have omitted from their consideration a single detail which can assist rapid and efficient production.

The fact that Mr. Paterson is in control of the works is sufficient guarantee that the work will be thoroughly well done, and though it will be some little time before production actually begins, one believes firmly that the apparent delay caused by organising production will be made up in a very short time by the perfect system under which production will proceed.

FOREWARNED AND FOREARMED.

On Friday, October 10th, 1919, J. Samuel White and Co., Ltd., of East Cowes, formerly well known as builders of seaplanes of very high quality, delivered to the Navy a new and powerful destroyer of the "W" class, known as the "Witherington." This ship was laid down on July 29th, 1918, and launched on January 16th, 1919.

From the aeronautical point of view the interesting point about "Witherington's" armament is that she carries special anti-aircraft high angle guns as part of her regular armament. This may be taken as proof that the Royal Navy at last recognises that aircraft are to be reckoned in future as one of the regular afflictions of war and that H.M. ships must in future be armed to combat this new weapon.

ROLLS-ROYCE, LTD.

In a letter received regarding the Rolls-Royce exhibit at the coming Olympia Motor Exhibition several interesting facts are stated about their aero engines.

During the war the Government required the whole of the Rolls-Royce works to be engaged exclusively in the manufacture of aero engines. Since the armistice the Government have required that a large proportion of the works should be engaged in making further aero engines. A new type is now being constructed of high horse-power.

It is also stated that the company have derived a great deal of information during their extensive experiments and experience connected with the construction of their aero engines. This information, which has helped to perfect their present car chassis, might otherwise have required many years to acquire.

PALMER TYRES AT OLYMPIA.

The Palmer "Cord" tyre—now used on practically every wheeled aeroplane in this country—will naturally enough be well represented at the forthcoming Motor Show.

Unfortunately, lack of space will prevent the exhibition of the Palmer cording machine, but a full line of their tyres will be on show at the stand of the Palmer Tyre, Ltd.

ILLUMINATION.

When the metal filament lamp—now the standard appliance for electric lighting throughout the world—was first produced great difficulty was found in producing the wire filaments in sufficiently small diameters to give units of sufficiently small candle-power for ordinary use, except when run on circuits of very low voltage. This limited their use to conditions where large lighting units could be employed or to cases where transformers could be used to give a low pressure supply.

Since those days constant experiments and research have removed these disabilities.

The nitrogen-filled "Half-Watt" lamp, introduced in 1913, was the result of a discovery that metal filaments could be run at a higher temperature and giving a much greater efficiency in an atmosphere of nitrogen than in a vacuum.

Although the filament of an incandescent lamp is well below the melting point of the metal, a kind of slow evaporation of the metal goes on continuously, and the metal is deposited on the bulb, blackening it, and thus greatly reducing the light given, and eventually causing the failure of the filament itself. The presence of an inert gas reduces this disintegration of the filament and allows it to be run at an increased output.

This type of lamp suffers from one fault of the early metal filament lamps and it cannot be made to give small candle-powers except on low voltage circuits.

In 1914 it was found that the use of Argon instead of nitrogen for filling this type of lamp made it possible to use finer filaments without disintegration and consequently to produce lamps of smaller candle-power.

Argon—discovered by Lord Raleigh in 1894—is an inert gas present in very minute quantities in the atmosphere. Until 1914, no use had been found for it, and there were no facilities for its collection, and under war conditions great difficulties were experienced in obtaining Argon for gas-filled lamps.

Since then the General Electric Company have laid down an Argon producing plant at the Osram Lamp Works at Hammersmith, and they are now producing ½-watt Osram Argon-filled lamps commercially.

100 to 130 volt lamps are made in sizes down to 60 watts, and lamps for circuits between 200 and 260 volts are made down to 100 watts.

The candle-power of these lamps is approximately twice that of the ordinary metal filament lamp consuming the same power.

ANOTHER TRANSFORMATION.

The following appears in the list of new companies registered :—

Kingsbury Engineering Co., Ltd.—Registered Oct. 13th. Capital £200,000 in 5s. shares. Objects : To carry on the business of manufacturers of and dealers in motor vehicles, cycles, ships, vessels, aircraft, etc. The first directors are : E. Barningham, Calcot Rise, Reading; H. Barningham, 11, Selwood Place, S.W.7; A. J. Foster, 445, Oxford Street, W.; and P. Lake, Kingsbury House, Kingsbury, N.W.9, all engineers. Solicitor : L. Blair, 94, Hope Street, Glasgow. Registered office : Kingsbury Lane, Kingsbury, N.W.9.

GREAT BRITAIN.

Civil Aerodromes.

The Air Ministry announced on Oct. 25th that the following lists of aerodromes are issued as an addition or in amendment of the lists already published :—

LIST B (Service Stations also available for Civil Use).

Amendments.—The following aerodrome has been transferred to List E and is now published in that list.

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Sherburn-in-Elmet.	Sherburn-in-Elmet.	Selby.

LIST C (Aerodromes temporarily retained for Service purposes.)

Amendments.—The following aerodromes have been transferred to List E and are now published in that list :—

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Lake Down	Amesbury	Salisbury
Newhaven (S)	Bishopstone	Newhaven
Sedgeford	Sedgeford	Hunstanton
Yatesbury	Calne	Marlborough

References : (S) Seaplane station

LIST D.

Aerodromes licensed as suitable for "Avro (504K) and similar types of aircraft " only. Except in very few instances accommodation does not exist. The licences have also in the majority of cases been issued for limited periods only.

Aerodrome.	Location of Aerodrome.	Nearest Large Town.
Brighouse	Stoney Lane	Halifax
Leamington	Polo Ground, Radford Road	Leamington

LIST E. (Stations no longer in use by the R.A.F.)

These stations have been passed to the Government Property Disposal Board. They will be relinquished as soon as the Government property thereon has been disposed of. In many cases the aerodromes are now under cultivation, but it is probable that the sites still form the best emergency landing grounds in the immediate neighbourhood.

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Lake Down	Amesbury	Salisbury
Newhaven (S)	Bishopstone	Newhaven
Scapa Flow (S)	Thurso (by boat to mainland)	Kirkwall
Sedgeford	Sedgeford	Hunstanton
Sherburn-in-Elmet	Sherburn-in-Elmet	Selby
Yatesbury	Calne	Marlborough

References : (S) Seaplane station.

The Continental Air Services.

THE AIRCO SERVICE.

The ninth week of regular flying between London and Paris was completed by Aircraft Transport and Travel, Ltd., on Oct. 25th. One hundred and thirty-five flights have now been accomplished out of a scheduled number of 139. The charts showing the volume of goods carried are showing a healthy upward curve.

THE AIRCO SERVICE

Date.	Type.	Pilot.	Left Hounslow	Arr. Paris.	Left Paris.	Arr. Hounslow	Pass

	D H. 16	Lt. Campbell-Orde			12.30 p.m.	2.50 p.m.	0

On Oct. 23rd Lieut. Lindley piloted a specially chartered machine, a D.H.4a, which left Hounslow for Brussels at 2.55 p.m., carrying a passenger on urgent business. The time of arrival at Brussels is not notified.

THE HANDLEY PAGE SERVICE.

During the week ending Oct. 22nd 47 passengers and 2,184 lb. of freight were carried on the Handley Page service London-Paris. Lieut. McIntosh piloted a machine that made a return journey to Paris on one day. The actual flying time was 6 hr. 40 min.

The Nieuport monoplane (180 h.p. Le Rhône) on which M. Jansen is attempting to become holder of the Coupe Deutsch. He completed the course at a speed of 124.6 miles an hour, and held the Coupe until two days afterwards M. Sadi Lecointe beat him with a speed of 153 miles an hour. It is of interest to note that the speed of this monoplane is not notably higher for the extra 50 h.p. than was that of the Bristol-Barnwell monoplane with the 136 h.p. Clergêt.

On Oct. 20th, despite the prevalence of fog over England and the Channel, a Handley Page accomplished its journey from Paris to Hounslow with freight and passengers. The visibility was very poor. The flight took 3 hr. 45 min.

On Oct. 24th a machine on the same journey with nine passengers and freight passed through a snowstorm in Kent.

During the week ending Oct. 22nd 19 passengers were carried on the London-Brussels service.

The London Customs Bill of Entry now contains in its Imports columns details concerning goods brought into Great Britain by air. A recent issue announced that the Handley Page Transport Co., Ltd., had imported from France quantities of silk, fancy goods, ladies' hats and embroidery.

THE B.A.T. SERVICE.

On Thursday, Oct. 23rd, the B.A.T. commercial machine, piloted by Mr. Cyril Turner, left Hounslow for Amsterdam, at which city he arrived in 2 hrs 40 min.

On Saturday, October 25th, Major C. Draper piloted a B.A.T. saloon-passenger machine with a full complement of passengers to Amsterdam. This trip is quite outside the regular service, but the demand for aerial transport to Holland is now growing, and it may be necessary to put on this service two machines per week instead of one.

THE LONDON-PARIS FLIGHT: FASTEST TIME.

Sir,—In your issue of October 22nd appears an advertisement of the Aircraft Manufacturing Company in which it is stated that a *racing machine*, piloted by Capt. Gathergood, accomplished the flight from Hounslow to Le Bourget in 1 hour 20 minutes, and a claim is made that this is the greatest speed so far attained on the London-Paris route.

This claim is quite unwarranted, because a far finer performance was accomplished in April last by a standard Martinsyde F.4 machine, which did the journey to Paris in 75 minutes.

The following figures have been obtained by us from the Air Ministry and relate to a flight made on April 9th by a standard Martinsyde F.4 (Rolls-Royce "Falcon" engine) flown by Capt. Jefferson on the ordinary London-Paris route, carrying despatches for the Communication Squadron. This machine left Hendon at 3.20 and arrived at Buc at 4.35. The distance on the route followed was 253 miles, and the speed works out at an average of 202 m.p.h.

As you are no doubt aware the Royal Aero Club recognise performances officially published by the Government as official performances, and so far as we know there was no official observance of the performance claimed by the Aircraft Manufacturing Company, which in any case is not the greatest speed on the London-Paris route; the Hounslow-Le Bourget route being a shorter route and the machine was apparently a specially-designed racing machine, whereas the performance set up by a Martinsyde was a standard machine in the hands of the R.A.F.

We shall be glad if, in justice to ourselves, you will give prominence to this letter in your next issue.

Yours faithfully,
Martinsyde Ltd.
HAMILTON FULTON (Director).

BOURNEMOUTH.

It is arranged that the Avro air fleet will visit Bournemouth to give a flying display for the week ending Nov. 2nd.

BRIGHTON.

On Saturday, Oct. 25th, the Avro air fleet visited Brighton for the third successive week-end. Tea was served on the ground and a band was present. The new aerodrome at West Platchington Farm, which consists of about 50 acres, is being fenced round and hangars are being erected.

A very large crowd collected on the aerodrome. Owing to the high wind the parachute descents had to be postponed, but Major A. G. Taylor, A.F.C., put up a very fine exhibition of trick-flying.

The chief interest, however, centred in the appearance of the little Avro-Green "Baby," which had been brought down from Hamble by Capt. Hammersley, M.C. The "Baby" played about in the air as usual, and delighted the crowd immensely. Another attraction was the display of the model aeroplane kites which have been invented by an A.I.D. official at Hamble. These were made to perform most extraordinary feats in the air.

BROOKLANDS.

A Weybridge correspondent of THE AEROPLANE writes:—

There has been little activity at Brooklands aerodrome lately, beyond a few test flights. The R.A.F. are expected to remain there for some months to come. Machines flying across country occasionally land at Brooklands, but there is no activity at present manifested in the way of passenger flights, etc. The repairing of the motor track has been started, but the aerodrome itself has a rural aspect, owing to the presence of hayricks and sundry horses, although the various buildings, hangars, etc., and an occasional aeroplane might lead the newcomer to believe that Brooklands was once a busy aerodrome.

Messrs. Gordon Watney and Co., of Weybridge, who, during the war, were engaged in manufacturing and repairing aero-engines, are closing down on aircraft work of all sorts. Among the types of aero-engines which passed through the hands of this firm were the Beardmore, Clerget, Le Rhône, Gnôme, B.H.P., Hispano-Suiza, and R.A.F. engines. Nearly 2,000 employees were engaged at one time in this work.

The firm has lately begun again the construction and repairing of automobiles, with Mercédès cars as a special line. Before the war they were very successful with Mercédès cars in racing on Brooklands track.

According to reports from authoritative sources the Anglo-American Oil Co. will take over the works as a motor repair depot.

Another report declares that the Vickers "Vimy" commercial machines, for which the Chinese Government have placed an order, will be constructed at the Weybridge works of Vickers, Ltd. A considerable extension has lately been made to these works, which are manufacturing various appliances, included among which are brick-making machines.—J. S. S.

LONDON.

HENDON.—Very little has been heard of the London Aerodrome at Hendon since the last of their summer meetings fizzled out owing to lack of public interest some months ago. With the general slackening down of the Aircraft Industry since the end of the war, it might have been thought that the place had died a slow and lingering death, but when one does get inside, quite a respectable amount of activity is to be found.

On the afternoon of Oct. 17th one's guide was Major Carr, A.F.C., D.C.M. (late R.A.F.). Under his cheerful guidance it was possible to make a tour of the workshops, where aeroplanes are still being constructed. Those most worthy of note are the Ganymede and two Grahame-White Limousines.

MULTI-PASSENGER-CARRYING MACHINES.

The Ganymede was constructed as a long-distance bomber early in 1918, but was not accepted by the Air Ministry. It was built as a twin fuselage three-engined biplane, fitted with two tractor and one pusher airscrews.

The pusher engine has now been removed and a large long cabin has been put in its place with seats for 18 persons. In place of the two Sunbeam tractor engines, two Napier "Lion" 450 h.p. engines have been fitted. The machine has made some quite successful test flights.

One of the two Grahame-White Limousines was recently on a test flight when the engines cut out owing to failure of the petrol system. A landing had to be made on a rough allotment. The machine was somewhat damaged, but would have fared much worse if it had been without the two sturdy emergency landing wheels which are fixed at the bottom of the cabin. On the occasion of the accident these wheels took most of the weight of the machine, as one side of the main undercarriage broke.

There are machines owned by many people in Grahame-White's sheds. One saw a Westland Limousine, several Nieuports, a few D.H.6, and the expected collection of Avros. There were also two Grahame-White biplanes, pushers of ancient design, still perfectly fit for flying.

THE CAPRONI TRIPLANE.

The Caproni triplane has been expected in Sweden for the last month. But for that time it has been at Hendon with its tail comfortably housed under a tin hangar. The remainder of the machine has perforce to stay in the open, there being no accommodation for it, but it does not appear to have suffered.

On the afternoon of Oct. 17th it was taken for a short flight. The Italian pilot was accompanied at the dual control by Capt. Chamberlayne (late R.A.F.). It appeared that only one passenger was induced to sit in the ball-shaped greenhouse, which is in reality a two-storied passenger-cabin which is slung uncomfortably near the ground under the centre nacelle, which also accommodates the two pilots on the upper "floor" and a third engine which helps to push the machine along from behind.

With all its engine-power the Caproni flies quite well. There are a considerable number of interplane struts with mostly single cable bracing wires.

The two tractor engines are placed in the noses of the two fuselages and apparently only supported by a few holding-down bolts to the engine bearers. The monoplane tail plane has three huge balanced rudders fixed on its top. They are resplendent with the Italian national colours.

THE B.A.T. CO

The British Aerial Transport Co. displayed some activity during the afternoon. A B.A.T. Baboon and an F.K.26 Commercial arrived on the aerodrome quite prettily as the darkness was setting in. All things considered, it was not as dull an afternoon as one in the summer, when only the

monotonous hum of the passenger-carrying carroty Avros disturbed the peaceful sight of the trains going by.

Major C. Draper, D.S.C., flew a B.A.T "Bantam," fitted with a 200 h.p. "Wasp" engine, from Hendon to Cowes on Oct. 23rd, and returned on the same day in 35 min.

NORTHOLT.—Considerable success has been achieved by the Central Aircraft Company at their School at Northolt Aerodrome, and Mr. Herbert Sykes, O.B.E., the Chief Instructor, appears to be getting excellent results out of the C.A.C. "Centaur IV" training machine, which is fitted with a 100 h.p. Anzani engine.

The excellence of the C.A.C. system of training is shown by the fact that two of their pupils, Mr. Tanner and Mr. Pool, who recently qualified for their Royal Aero Club certificates, passed their tests after 3 hrs. 15 min. and 3 hrs 30 min. respectively in the air. The result is that each of them has now a matter of 7 hours' further flying practice as a properly certificated aviator before he has completed his full 10 hrs. of flying as specified in the School contract

Some of the earlier pupils have put up even more satisfactory performances in that one of them qualified after 1 hr. and 40 min. flying, and another one after 2 hrs. and 5 min. practice, which is certainly uncommonly good.

MANCHESTER.

The northern Avro fleet held a carnival at Alexandra Park aerodrome last week-end for the benefit of the Manchester and Salford Hospital Saturday Fund. Over 9,000 people paid for admission, and passenger-flying went on briskly till dusk came on, leaving many applicants for tickets disappointed. About £300 was handed over to the hospital fund. The flying display was as fine as was to be expected from the Avro pilots. Another display will be given on the same aerodrome next week-end.

CANADA.

SLOW DISTRIBUTION.

A member of the Aerial League of Canada at Victoria, British Columbia, writes that the League is trying to obtain some of the 107 machines given to Canada by the Imperial grant. By the present system of distribution they will be obsolete by the time the League lays hands on them.

A REBUILDING AND A PRECEDENT.

Yarrows, Ltd., shipbuilders, of Victoria, B.C., have rebuilt the Pathfinder I, a Curtiss training aeroplane which met with a bad accident. The machine had to be virtually constructed, and the shipbuilders, unused to that type of craft, had only technical blue-prints to guide them. The mechanics of the Aerial League gave advice on the more technical sides of the work.

The Pathfinder II (Curtiss Training Machine) at Victoria, B.C., during a flying exhibition.

When the machine was completed the Aerial League intended to fly the machine over Victoria with the Pathfinder II. On that occasion, for the first time in the history of the city, two aeroplanes would take the air in formation.

The Pathfinder II has been visiting various fairs in the district and taking up passengers, piloted by Mr. W. H. Brown. At Puyallup Fair a young couple insisted on going up together, so for the first time the Curtiss carried three persons.

M Sadi Lecointe, the temporary holder of the Coupe Deutsch, and M. Herbemont (on the right), the designer of the Spad-Herbemont monoplane.

BRAZIL.

THE AIR SERVICES.

According to Brazilian journals it is expected that the preliminary flights over the civil aerial transport routes which are to be served by the Italo Brazilian Aerial Transport Company will be made during October.

The machines to be used are two Capronis. The concern is under the management of the Italian engineer Signor Gialio Cappa Bava, and there are at present three Italian pilots, Lieuts. Guiseppi Gandola, Mario Quaranta, and Virgilio Ercolani. Lieut. Gandola is said to have been of D'Annunzio's squadron during the war.

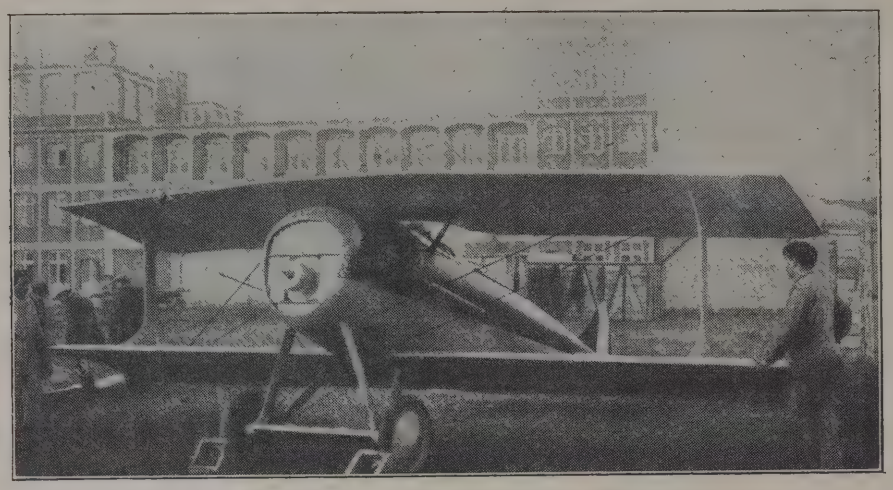
DENMARK.

The Danish correspondent of THE AEROPLANE writes :—

Now that an air commission has been appointed and the Danish Parliament will soon sanction the Air Navigation Act, The Danish Traffic Co. (in preparation) has handed in applications for concessions on a number of routes. Under the new conditions the Government will control aviation very extensively and will not support private enterprise at State expense by granting concessions, though their issue do not mean monopoly on any line.

The home routes in question are : Copenhagen-Aarhus-Aalborg-Skagen ; Copenhagen-Odense-Kolding-Esbjerg and likely a route Aarhus-Flensborg, if the latter city returns to Denmark. Further, the foreign lines are : Copenhagen-Stockholm (perhaps on to Helsingfors and Petrograd) ; Copenhagen-Gothenburg - Christiania - Trondhjem ; Copenhagen-Esbjerg-Hull ; and Copenhagen-Warnemünde-Berlin (and perhaps Vienna), and finally various western routes, which have not been fully settled yet, as the negotiations with the air traffic companies there have not been finished.

FRANCE.



THE COUPE DEUTSCH.

On Oct. 20th M. Sadi Lecointe on a Spad Herbemont biplane (300-h.p. Hispano Suiza) flew over the Coupe Deutsch course at a speed of 156.5 miles an hour. Passing the Chateau de St. Germain at 3.18⅘ p.m. he repassed it at 4.3½ p.m. To beat this time it will be necessary for the next challenger to fly at a mean speed of about 172 miles an hour.

On Oct. 22nd M. de Romanet, flying a Nieuport biplane (300-h.p. Hispano-Suiza), made an attempt on the Coupe Deutsch. He left St. Germain at 2.3 p.m. and returned at 2.45, thus covering the course at a mean speed of about 167 miles an hour. Though faster than M. Sadi Lecointe, M. de Romanet does not become holder of the Coupe as his speed does not exceed that of the former pilot by the necessary 10 per cent.

THE FEDERATION AERONAUTIQUE INTERNATIONALE.

The Congress of the F.A.I. was held at Brussels on Oct. 22nd, 23rd, 24th. The representatives of Great Britain were, as stated last week, Lieut.-Col. McClean, Lieut.-Col. Ogilvie, Lieut.-Col. O'Gorman, and Mr. Perrin. France's interests were upheld by H.I.H. Prince Roland Bonaparte, M. le Comte de la Vaulx, MM. Tissandier, Besancon, Blondel, La Rougery, Clunet, Boyer, Guillan, Lieut.-Col. Ferrus, M. Gasnier, Capt. Hirschauer, MM Imbrecq, Laillemant de l'Institut, A. Leblanc,

THE HOLDER OF THE COUPE DEUTSCH.

The Spad-Herbemont biplane (300 h.p. Hispano-Suiza) on which M. Sadi Lecointe completed the Coupe Deutsch course on Oct. 20th at a speed of 156 miles an hour. He is the temporary holder of the Coupe Deutsch until his speed is beaten by 10 per cent. This means that to dispossess M. Sadi Lecointe the next competitor must achieve a speed of 173 miles an hour.

M. le Comte de la Valette, MM. Quinton, Rousseau, Screan, Surcouf, Saunière, General Roques, and Capt. Fonck, Japan, Norway, Netherlands, the United States, Denmark, Sweden, Brazil, and Italy all sent representatives

THE NEW POSTAL ROUTES.

A decree outlining the new rates for the aeroplane post in France and Morocco was printed in the official gazette dated Oct. 21st, 1919. The rates for foreign countries remain at the rates previously settled by the respective countries concerned. The new internal rates for France and Morocco and between France and England are as follows :—The ordinary postal rates fixed by the International Postal Convention (in the years before aviation had become more than a dream) plus a surcharge by the country of origin of 3 frs. for each 20 grammes (or 2s. 6d. for each English ounce).

THE FARMAN "DAVID."

The little Farman two-seated biplane (40-h.p engine) known as the "David" recently produced by the Farman brothers is of the following dimensions :—Span, 23.294 ft.; chord, 5 ft.; length, 19.6 ft.; total plane surface, 215.286 sq. ft.; weight ready to fly, 440.924 lb. The price to the public is 12,000 frs. (about £330 at present rates of exchange). The cost of running this machine is said to be about thirteen centimes a kilometre.

THE FARMAN PROGRAMME.

The Farman brothers intend to open direct aerial services between Paris and London and Paris and Brussels. They undertake to convey passengers from Buc to London, Brussels, Rome, Madrid or as far as the pocket of the traveller will permit. These journeys may be made in single-seated, two-seated, four-seated, six-seated, or twelve-seated aeroplanes.

They are specialising in the construction of aeroplanes for those who desire to adopt aerial touring as a hobby. In addition to the "David" referred to above the Farman brothers are producing the F.70 three-seater with tractor airscrew, the F.40 three-seater with a propeller airscrew, the flying limousine F.50 with tractor airscrews, and the twelve-seater "Goliath."

A MOROCCAN AERIAL POST.

A civil aviation firm is shortly opening an aerial post in Morocco and to Spain. Letters from France will be taken by train to the Sud Express terminus in Spain and thence will be transported daily by aeroplane to Tangiers, Rabat, or Casablanca.

AN EXHIBITION FLIGHT.

The Vickers Vimy commercial aeroplane piloted by Capt. Cockerell which is on an exhibition tour on the Continent has visited Paris and Bordeaux. The machine was exhibited at both places and then flew to Biarritz (near the borders of Spain). The journey from Bordeaux to Biarritz took two hours.

THE SALON DE L'AERONAUTIQUE.

A correspondent writes :—

There is a point which may trouble exhibitors of large machines. If they are being flown over, to be dismantled and taken by road to the show, the exhibitors ought to be warned that the gates of Paris are barely three metres wide, so that large fuselages could not pass. There is one method of avoiding this trouble by taking the machine up river on barges to the quai near the Grand Palais. M. Bleriot is doing this.

All the available space for aeroplanes has been applied for, but there is still room in the galleries.

Bristols, Handley Pages, Westlands, Boulton and Paul, the French Vickers, and the S.B.A.C. have applied for stands.

A MOROCCAN TRANSPORT LINE.

A new transport line is being opened in Morocco in November by a group of well-known French pilots. Sopwiths (French-built), converted to take two passengers, are being used. They are the single-seaters which were built in France as two-seaters, with Clerget 130 h.p. engines, and known here as "Camels."

PASSENGER FLIGHTS.

Lieut. Madon and his partner, Lieut. Nodin, are going on with their passenger-flying at holiday resorts during the winter. They are doing as much as any syndicate in France to popularise aviation. During the season at Boule and Trouville they took up over 5,000 paying passengers with one G.3 Caudron.

THE LUMIERE AIRSCREW.

The Lumière Airscrew concern has been converted into a Société Anonyme, with a capital of 500,000 frs. Directors : Madame M. Lumière and M. de Monge. This is the only propeller factory in France working full time. All the competitors for the Schneider Race and the Coupe Deutsch, with the exception of the Gourdou, had Lumière airscrews, which shows the esteem in which this design is held over here. All the G. Levy flying-boats in use on the Belgian Congo Aerial Transport Line have also their airscrews with the lacquer finish which prevents warping in hot climates.

AIR NAVIGATION REGULATIONS.

Navigation and Maintenance Regulations, similar to those in force in England, are being prepared, making flying conditions the same in France as in other countries. The "Air Navigation Department," of which Colonel Saconey is the

THE FASTEST OVER THE COURSE.

Side view of the Nieuport biplane entered by the Nieuport Co. for the Coupe Deutsch and flown by M. de Romanet, who was the firm's spare pilot for the Schneider Cup Race. This Nieuport is a modification of the famous "Type 29," which did so well towards the latter end of the war. This machine covered the course at an average speed of 167 miles per hour, but as it did not exceed the Spad's speed by 10 per cent. it does not hold the Cup.

GERMANY.

According to the "Times" of Oct. 28th all the aerial post and passenger traffic between Germany and Czecho-Slovakia has been taken over by the Saxonian Airship Company, of Dresden. The airship service will run thrice weekly.

A New Landing Ground at Karlsruhe.

The parade ground at Karlsruhe is now to be turned into a landing ground for aeroplanes in accordance with the plans of a company whose interest is the development of public interest in the downs of Karlsruhe.

An Italian Aeroplane in Germany.

The Danish correspondent of The Aeroplane writes :—

On Oct. 6th the first Italian aeroplane landed in Germany. It was an Ansaldo biplane, fitted with a 300-h.p. Fiat engine, and alighted at 5 o'clock in Johannisthal with two officers on courier service to the Italian Consul in Berlin. They had left Rome some days before, flying on the first day via Venecia to Vienna and on in the afternoon to Warsaw, carrying out their orders. The non-stop flight from the Polish capital to Berlin took six hours. The machine was housed in the shed of the German Air Traffic Co. and was to return by air to Rome via Turin.

HOLLAND.

The Handley Page machine which was exhibited during the E.L.T.A. at Amsterdam left for Scandinavia on Oct. 21st, via the Dutch aerodrome of Soesterberg.

NORWAY.

The Danish correspondent of The Aeroplane writes :—

The Thulin-trained Norwegian pilot, Juhl, carried out joy-rides at a seaside resort near Copenhagen this summer with a le Rhone-engined diagonally-strutted Nielsen and Winther three-seater flying boat, till a special certificate was required for public flights. Then he intended to return to Norway by air, but after leaving Skagen a petrol pipe broke near the Norwegian coast. After drifting for twenty-two hours in Skagerak and Kattegat the flying boat stranded on a small island at the Swedish coast, rescued by a fishing motor-boat, the former assisting before getting anyhing to eat.

SPAIN.

The Barcelona Flying Meeting.

The Barcelona Flying Meeting took place on Oct. 12th. Among the machines were an Ansaldo (250 h.p. Spa), an Espagna (180 h.p. Hispano-Suiza), an Alfaro (180 h.p. Hispano-Suiza), a Vendome (60 h.p. Le Rhone), a Caudron-type biplane G3 (80 h.p. Le Rhone), a Morane-Saulnier "Parasol" two-seater piloted by M. Bourgeois, and a Morane-Saulnier "Parasol" single-seater (110 h.p. Le Rhone), piloted by M. Fronval. M. Fronval and M. Bourgeois flew in a thick fog and succeeded in getting the first and second prizes respectively in the competition (a race over a circuit of about 66 miles. On Oct. 14th these two pilots flew to Madrid.

SWEDEN.

The Danish correspondent of The Aeroplane writes :—

At the request of the Swedish Hydraulic Department, the Swedish Air Traffic Co., Ltd., has worked out a detailed preliminary estimate for the establishment of an air connection between Porjus and Lilla Sjöfallet, where large hydraulic works are being carried out.

The heavy competition that the British aircraft trade has to stand to Germany owing to the present low mark value is evident from the estimate, as three seaplanes, with spares, of the Friedrichshafen type are calculated at kr. 170,000 (£9,445) against the cost of kr. 197,000 (£10,945) for three Short seaplanes of the sporting type—a difference of £2,500.

SWITZERLAND.

Permission to Fly.

Foreign aviators wishing to fly in Switzerland should apply to the Swiss Military Department at Berne, which is the only authority capable of issuing permits. All aeroplanes entering Switzerland are placed on a special register and if they are to remain in the country must have inscribed on the wings and fuselage the letters C. H. (for Confederation Helvetique) in white on a red base, and in addition the special registration number.

UNITED STATES OF AMERICA.

The Aerial Mail Service.

The Post Office authorities have made the announcement that it is intended to establish an aerial mail service from New York to San Francisco. A Bill has been introduced in Congress to give power to appropriate money for this purpose. It is said that the decision was arrived at as a consequence of the success (?) of the Army transcontinental air race.

AIRCRAFT IN PARLIAMENT

HOUSE OF COMMONS.

The following oral answers were given on Oct. 22nd :—

GOVERNMENT DEPARTMENTS (STAFFS).

Mr. GILBERT asked the Under-Secretary of State to the Air Ministry whether he will state what reduction in staff has taken place in his Department, including those employed at depots, since Nov. 11th, 1918; and whether he is taking any steps to make further reductions.

The UNDER-SECRETARY of STATE for AIR (Major-Gen. Seely) : I am not sure what my hon. friend means by "including those employed at depots," but I assume that this is to be interpreted as including all persons employed. Since Nov. 11th, 1918, the numbers employed by the Air Ministry at headquarters and depots have been reduced from 68,150 to 24,700 on Sept. 30th, 1919. These are approximate figures, since all returns are not made up to the same date. Further reductions have been made since Sept. 30th, and the process is continuing as rapidly as possible.

ROYAL AIR FORCE.

Mr. CLOUGH asked the Under-Secretary of State to the Air Ministry if he will inform the House what was the strength of the personnel of the Air Force on Oct. 18th; what it was on Aug. 12th, 1918; and what it was on the date of the Armistice.

Major-Gen. SEELY : The particulars asked for by my hon. friend as to the strength of the Royal Air Force on the dates mentioned by him are as follow :

	Officers	Other ranks.
Date of Armistice	30,122	263,410
Aug. 12th, 1919	9,044	39,671
Oct. 18th, 1919	6,005	31,976

An HON. MEMBER : Can he say whether all the anti-aircraft stations have now been abolished in this country?

Major-Gen. SEELY : I could not say that without notice. It does not come under my Department, but under the Home Forces. It ought to be put down to the Secretary of State for War.

Sir W. JOYNSON-HICKS : How many women are included in that last total.

Major-Gen. SEELY : I could not say that without notice.

AIR FORCE (REVISED) ESTIMATES.

Mr. CHAMBERLAIN, replying to Mr. Arnold, said that he hoped that the Air Force Estimates would be presented early next month.

* * *

The following oral answer was given on Oct. 23rd :—

WOMEN'S ROYAL AIR FORCE.

The UNDER-SECRETARY of STATE for AIR (Major-Gen. Seely), replying to Lieut.-Comdr. Kenworthy, said that the numerical strength of the Women's Royal Air Force on Sept. 30th, 1919, was officers 164 and other ranks 5,800.

It is proposed to reduce the number of all ranks to 400 by Dec. 1st, and to 200 by January 1st, 1920. The number of female civil subordinates on the same date was 2,529.

* * *

The following answers were given on Oct 27th, and are extracted from the "Times" of Oct. 28th :—

A BRITISH AIRSHIP FOR AMERICA.

Major-Gen. SEELY, Under Secretary for Air, in reply to Colonel Moore-Brabazon, said :—Arrangements have been made between the United States Navy and the Air Ministry by which the airship R.38, embodying the newest features in design and construction, will be completed without delay. The vessel will be handed over to United States naval personnel on completion, and will proceed to America with her American crew as soon as the shed to house her is ready. The United States Navy will take over the vessel at cost price, the Royal Air Force undertaking the training of the American naval personnel, free of cost, except pay and rations.

DESTRUCTION OF AEROPLANES.

Mr. A. T. DAVIES asked the Under Secretary of State to the Air Ministry whether large numbers of aeroplanes had been destroyed by burning in the occupied districts of France and Belgium; whether aeroplanes of the newest type were being delivered under contracts until the summer of this year; and whether the Canadian Government, adopting a different policy, disposed of similar aircraft with commercial advantage.

Major-Gen. SEELY, Under Secretary to the Air Ministry, said :—In answer to the first part of my hon. friend's question instructions have been given :—(a) That any aircraft declared obsolete for all purposes (i.e., Air Force and civil) shall be reduced to produce, and the produce handed to the Disposal Board; and (b) that any aircraft totally wrecked and beyond repair shall be reduced to produce, and the wreckage burned after the removal of all parts of value. The number of crashed aircraft burnt after the removal of the valuable parts under (b) has been 28. In addition, since July 1st, 1919, the residue of 250 crashed and 350 deteriorated or obsolete machines have been burnt after the valuable parts had been removed. The answer to the second part is in the affirmative. I have no official knowledge of the matter referred to in the third part of my hon. friend's question, but I think he has in mind a transaction carried out by the representative of the Ministry of Munitions in Canada on behalf of His Majesty's Government. If I am correct I would refer him to the Minister of Munitions.

THE GOVERNMENT AND CIVIL AVIATION.

Major-Gen. SEELY, replying to Colonel Burgoyne, said :—Whilst no direct subsidies are being made by the Government for the development of civil aviation, assistance is given to all firms desirous of receiving it in the following directions :—The free supply of meteorological information and free communication services (i.e., wireless, signals, flying directions, etc.). Arrangements are also in hand for the establishment of a system of emergency landing grounds throughout the country, which will be open to all firms who wish to make use of them. At Government aerodromes, other than those required purely for Royal Air Force services, aerodrome facilities and shedding are available for all firms on lease, thus saving them a considerable proportion of the initial capital expenditure.

EXPENDITURE.

The following was contained in Table III—Estimated Expenditure—of the White Paper laid before the House of Commons by Mr. Austin Chamberlain on October 27th :—

	As estimated in the Budget.	As now estimated.	More or less than in the Budget.
Air Force	£66,500,000	£57,500,000	—£9,000,000

Air Services.—The reduction is due to the transfer of expenditure on winding up Aircraft contracts to the Vote for the Ministry of Munitions. Provision is made for increased pay of the Air Force (£100,000).

ELECTRICAL ENGINEERS & CABLE MAKERS

Johnsons

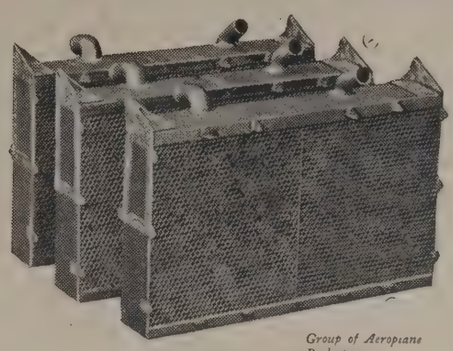
Only by maximum production will British Commerce regain its long enjoyed ascendancy.

It follows that in every sphere of manufacture all directing Heads are assiduously searching every channel where assistance in the fulfilment of this purpose is likely to be found.

The application of electricity to their own peculiar needs is one means of progress which they must not fail to carefully examine.

And in this connection our experience as manufacturers of Electric Cables and Plant, and the fact that we have specialised in the transmission, distribution and application of this form of power to the many varying requirements of the Industrial World, should materially help.

That experience is placed unreservedly at the disposal of our customers.



You should write and state your case.

The HANDBOOK of

Modern Aeronautics

By ARTHUR W. JUDGE, Assoc. R.C.S.

THIS Handbook is designed to fill the need for a single volume of convenient size, containing all available aeronautical

FACTS, DATA and TABLES

that those interested in the practical side of aeronautics need. There is no other similar book, and in its compilation the author has made practical value and utility his first consideration. Containing over 1,000 pages, packed with flying facts and figures, it comprises

A HANDY BOOK OF REFERENCE

for Aeronautical Engineers and Pilots, Manufacturers, Designers, Draughtsmen, the Works Staff and the Student. Comprised in nineteen sections and five appendices, the practical man can instantly put his finger on information wanted about:—

Screw Threads, Wire Gauges, Limits and Tolerances—Weights and Weight Estimates for Aeroplane Design—Properties of Materials—Aeroplane Fittings—Mathematical Rules, Data and Formulæ—Mechanics—Aerodynamics—Aeroplane Design—Aeroplane Performances—Stability and Control—Aeronautical Instruments—Meteorology—Navigation—Aircraft Engines—Airscrews—Flying Boats and Seaplanes—General Standard Material Specifications—Additional Aeroplane Performance Data—Additional Stability Data Results—Carburetters—Radiator Thermometers, and other subjects of practical value.

345 ILLUSTRATIONS. 350 TABLES.

THE AEROPLANE says—"Mr. Judge has collected a vast amount of information relating to aeronautical engineering into a kind of 'Super-Molesworth.' . . . Altogether the book should prove extremely useful to all aeronautical engineers, and is well worth its price."

THE MANUFACTURING PROBLEM SERIES.
General Editor: EDWARD T. ELBOURNE.

THE COSTING PROBLEM.
By EDWARD T. ELBOURNE.
Price 4s. 6d. By post 4s. 10d.

The upheaval of War and consequent reconstruction of industry on a peace basis involves the re casting of commercial judgment. Pre-war experience is no longer a sufficient guide to trading operations, and no manufacturer ought to face the future without means of accurately measuring the cost of production.

Other Volumes in this series:—
"THE MANAGEMENT PROBLEM"
By the same Author. *Nearly Ready.*
"THE RE-ORGANISATION PROBLEM"
By J. E. POWELL. *In Preparation.*
"THE WORKERS' PROBLEM"
By W. WILKINSON. *In Preparation.*

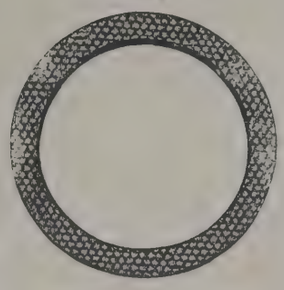
Fine Grain Means Quality.

The best wood has the finest grain, and grain in steel is equally a test of quality. That is why

Edgar Allen's

Red Label Steel

can be trusted to do its work efficiently. Examination of a fractured piece reveals a silken surface. Owing to the presence of a small percentage of tungsten in its composition, this steel offers far greater torsional resistance than any ordinary carbon tool steel. This, together with its uniformity, makes it ideal for Reamers, Threading and Screwing Dies, Broaches, etc., etc.



Write for Red Label Folder.

Edgar Allen & Co. Limited

Imperial STEEL Works, Sheffield.

A NEW CLUTCH RING.

Pure Asbestos without WIRE.

AN entirely new departure in the method of fitting fabric linings to plate clutches. The rings are made endless of die-moulded asbestos without wires, and are so constructed that free movement is assured in all circumstances; they float in a recess.

The rings being free both sides take up the pressure, which is evidenced by the marked sweetness of action.

We have tested these rings exhaustively at our works. A ⅝-in. wide ring of 14 ins. outside diameter, area 36 sq. inches, under a pressure of 22 lbs. per square inch transmitted 30 h.p. at 1,000 revs.

This is undoubtedly the last word in clutch linings and fuller information will be sent on request.

E 10.

You couldn't see it from below

but it's nevertheless a fact—a fact which every flying man and aircraft manufacturer should note—that the majority of the machines competing in the Aerial Derby, including the three which were placed 1st, 2nd and 3rd, at the end of the race, were fitted with

AUSTER TRIPLEX
AERO WIND SHIELDS

And that proves what the men who "know" think of them.

Let us have YOUR enquiries.

ON OUR SUPERFLUOUS NAVY.

It would appear that their Lordships of the Admiralty are very seriously perturbed about the future of His Majesty's Navy because of certain recent developments in the use of aircraft. One calls them recent developments rather because they have only recently penetrated the Navy's intelligence than because they are in fact recent so far as aircraft themselves are concerned. Rumour has it, in fact, that the Navy is gravely considering whether it shall take over the whole of the seafaring portion of the R.A.F., or whether it shall persist in its old obtuse ways until it is itself taken over by the R.A.F. Which is to say that the Navy's intelligence is at last grasping the fact that the Navy as at present constituted is an expensive superfluity.

One has dared to hint in this paper at such a state of affairs at various times during the past few years, but it has taken until the last few weeks for the idea to have any effect on our warriors of the sea, and the story of how they have been forced to think is worth telling. Albeit the story is probably very inaccurate in detail, it is believed to be reasonably true in its general outline, and so it deserves to be told, if only as a yarn.

The Cause of Conversion.

The story goes that a certain strong detachment of our Fleet was lying in harbour near a certain R.A.F. Station which happened to possess a few aeroplanes adapted to the carrying and dropping of torpedoes. The R.A.F. people, ever anxious to amuse the Navy, proposed to the Admiral commanding the Fleet that they should make an attack on his ships with dummy torpedoes on a certain morning, and the Admiral, with that careless *bonhommie* so characteristic of the British sailor, consented to be their target.

So, on the morning agreed, the merry *matelôts* stood to their guns, prepared to abolish—in theory—these funny flying people who thought that they could dispute with the British Navy the Command of the Sea. And, as they swept the horizon from which the torpedo-droppers must arrive, there appeared high in the heavens three or four harmless little aeroplanes, far too high to drop torpedoes or to make good aim with bombs.

Then, a mile or two to windward of the Fleet, there were seen a number of small splashes in the water. In a few seconds there arose from these splashes a thick and mephitic smoke which drifted down wind onto the Fleet and enveloped it in a dense fog. And, as the fog began to clear away, there came thud after thud against the anchored ships, and with a roar of engines half a squadron of aeroplanes swept over their mastheads and away up into the sky out of range before the astonished *matelôts* had time to train a gun on them.

The aeroplanes had scored seven hits out of nine shots, and theoretically had sunk or permanently disabled seven ships without losing an aeroplane. And as a result, to quote a ribald aviator, the Big Brass Hats at the Admiralty are now held in suspension by a perfectly vertical blast.

The Dawn of Intelligence.

Whether one regards the aeroplanes concerned in this affair as being analogous to the Cross in the Sky which converted Constantine the Great, or merely as Balaam's ass arguing with its master, the fact remains that the Navy has been given furiously to think, and from what one hears there seems to be something resembling the dawn of intelligence in the King's Senior Service.

The coming of Earl Beatty to the Admiralty has also tended to brighten the minds of the officials in that august establishment. Admiral Beatty being an Irishman—and a County Wexford man at that, Wexford priding itself on being "the model county"—it is natural that he should have a quicker wit and a more practical mind than the majority of Senior Naval Officers.

There is a certain type of mind which is capable of seeing far ahead in a nebulous way, but is quite incapable of appreciating at its full value and of using the means immediately to hand. We have had lamentable examples of the working of this type of mind in the recent self-exposures of Lord Fisher and Sir Percy Scott. Each of them has bleated loudly about his faith in flying. The latter has even delivered himself of the startling prophecy that aircraft will command the air and the sea beneath. But, barring Lord Fisher's encouragement of the "Blimp" type of airship—as submitted to him by Mr. Holt Thomas and Mr. E. T. Willows conjointly—one cannot recall that either of these eminent writers has ever done anything to aid the immediate development of aircraft.

Admiral Beatty, on the other hand, from the moment when he assumed a position of importance in the Grand Fleet, set to work to encourage the aircraft people. And when he was appointed to the command of the whole Fleet, on the opportune removal of Admiral Jellicoe, the position of the R.A.F. was vastly improved, in spite of the great drawback of being an alien Service working in the ships, instead of being part and parcel of the Navy as was the R.N.A.S.

It was under Admiral Beatty that deck-flying and torpedo-dropping were given a fair chance. It was under his régime that kite-balloons with the Fleet increased and multiplied like rabbits. It was he who realised, before all other senior officers, that the Fleet of the future must depend for its safety entirely on its aircraft.

A Logical Sequence.

It must follow as a logical sequence in the practical Irish mind of such a man as Lord Beatty that, if the existence of the Fleet is to depend on its aircraft, then the aircraft and the personnel which operate them must be part and parcel of the Navy.

To locate a couple of deck-flying aeroplanes, with pilots, observers, technical officers, N.C.Os., and men of the R.A.F., on a cruiser or battleship is about as sensible as putting the personnel of a "heavy" battery of the Royal Garrison Artillery on board a ship to work its guns. One does not doubt the probability that the

R.G.A. would improve the ship's shooting, but their existence on board would not be over-pleasant, and their dual administration by the Admiralty and War Office would certainly upset the routine of the ship.

The Question of the Day.

No man can serve two masters, and aircraft personnel on board ship cannot serve the Admiralty and the Air Ministry. Either the ship and the aircraft which it carries must belong to the Admiralty, or the aircraft and the ship which they use as a home and as a stores depot must belong to the Air Ministry. Either the aircraft must go where and when the N.O. commanding the ship desires, or the ship must go where and when the O.C., R.A.F., desires. And the whole outfit must belong to the Service which controls the movements of the whole. The question to be decided is: Which Service is to control the other?

It is demonstrable that, though the Navy cannot exist without aircraft, a seagoing Air Service can exist without the Navy as at present constituted. Therefore on the face of it there seems to be a strong argument in favour of putting the Navy under the control of the Air Ministry. But, the Navy being the pet of the British public and the Air Ministry being, deservedly, its *bête noir*, it is obvious that such a thing could not be. Let us therefore examine the question in some detail, and in the light of practical examples.

If There Had Been!

When Admiral Sir Doveton Sturdee's very superior ships sank the squadron of the gallant Admiral von Spee off the Falkland Islands they did so because the British guns began hitting at 17,000 yards or so, at which range the German guns were incapable of reaching the British ships, in spite of their excellent shooting. But suppose that instead of consisting of inferior fighting ships von Spee's squadron had been composed of seaplane-carriers, armed with torpedo-droppers of the type which recently theoretically abolished a British squadron, as related at the beginning of these notes. Von Spee's torpedo-planes could then have attacked the British ships at any distance they pleased, and must inevitably have sunk them.

There is an added advantage about the torpedo-dropper in that it can attack successfully when visibility is so bad that superiority of range in guns is of no advantage. Therefore, whether at long or short range, the torpedo-dropping aeroplane flown from the deck of a ship can beat the big gun.

The Dover Patrol.

Let us take another example. It is an axiom that a gun in a fort can always beat a gun afloat. This was proved beyond question at the Dardanelles, and again by the abject futility of the operations of Admiral Bacon's much-advertised "Dover Patrol" against the Belgian Coast. The best his ships could do was to steam up to the coast in the morning mist, fire blindly at the coast, and then run away before the Tirpitz Battery and the other big German shore guns got onto them.

Anybody who has skirted the Belgian coast between Dunkerque and Flushing can see that practically no damage has been done in Belgium, except by the Army's operations at Nieuport. The rest of the coast hardly seems to have known that there was a war on.

But if, instead of all that amazing waste of money on monitors and other ships with big guns, the Dover Patrol had been adequately equipped with bombing and torpedo-dropping aeroplanes, the German positions along the Belgian coast could have been bombed till they became untenable, every German warship which tried to use the harbours at Ostende and Zeebrugge could have been torpedoed where she lay, and every submarine which tried to lie up in the docks and canals could have been destroyed with depth-charges.

Guns versus Aeroplanes.

Thus it must be evident, even to a naval intelligence, that the long-range naval gun is useless in future either for fleet actions or for use against positions on land.

Parenthetically, one may observe that the Army discovered in the first day or two of the attack on Gallipoli that the Navy's shooting was useless against the Turks on the peninsula. Further, though we have heard a good deal about the work of the Navy in support of the "loyal" Russians against the Bolsheviks, both on the Arctic fronts and on the Baltic coast, it would seem that the few seaplanes carried by the ships have done much more good than have all the naval guns.

A big gun costs very much more than an aeroplane. In fact, a single shell for the biggest guns costs approximately as much as a single-seater scout. When a shell has burst it may or may not have done damage, but an aeroplane, when it has dropped its bombs or its torpedo, remains a weapon of offence, in that, having demoralised its foes and having done damage, considerable or inconsiderable, it can return to the scene in a few seconds and carry on the good work with its machine-guns.

If it be admitted that the day of the big naval gun is past, it may be claimed that the day of the heavily armoured fighting ship is also done. One believes that naval "experts" deny that it is possible to armour against torpedo attacks, and if heavy armour is useless against torpedoes, then the battleship may as well be abolished.

Thus we come to a Navy composed entirely of ships of the type of "Furious," lightly armoured, very fast, and equipped with quantities of aeroplanes, bombs, and torpedoes. Their only guns would be those required for anti-aircraft and anti-submarine work.

Political Pull.

From the abolition of surface ships of present type it would naturally follow that the Navies of the World would go to the other extreme and produce submarine battleships. Already, it is said, our big submarines carry 12-inch guns, and there is nothing except the cost to prevent the building of a submarine as big as the biggest battleship and carrying 17-inch guns, if people are still so foolish as to believe in big guns.

If the armament firms whose directors disbelieve in aircraft and still believe in big guns decide to use their political pull in favour of their gun-foundries instead of the aircraft departments which some of them have stupidly shut down since hostilities ceased, no doubt we shall have these submarine battleships foisted upon us. Whether we do or not would seem to depend largely on whether the aircraft firms, aided by the aircraft departments of the armament firms, have more political pull than the gun-foundry interests.

In any case, the aeroplane armed with bombs and depth-charges can keep a fleet of submarine warships under the water just as easily as it can drive a fleet of surface ships off the face of the water. No force of submarines will ever dare to show their periscopes near any coast or any fleet which is adequately supplied with aircraft.

The New Submarine Aircraft.

But there is an opportunity for a new type of submarine and a new type of aeroplane which will do much to complicate the existence of the big seaplane-carriers of the future.

Very early in this war, when the subject of bombing Germany was being much discussed, and a peculiarly futile R.N.A.S. expedition was about to be sent to

Eastern France to bomb the Rhine towns, the ingenious Mr. Pemberton Billing propounded a very much better scheme. His idea was to build a special type of flying-boat with the engine in the hull, and the wing-structure to fold down and inwards, so that the whole machine could be packed into a coffin-like box very little bigger than the hull of the boat. This machine was to be carried in a water-tight compartment built onto the hull of a submarine.

A flotilla of submarines thus equipped were to go secretly into the Baltic, meet off the German coast, and release their flying-boats, armed with bombs, for a raid on Berlin, which is only a matter of 100 miles from the coast in a straight line. A similar flotilla was to dive into the Helgoland Bight and raid Hamburg—it will be remembered that our submarines habitually dived into the Ems and Jade.

A Simple Proposition.

It was a delightfully simple idea, like all Mr. Pemberton Billing's schemes. He actually had a hull built for such a flying-boat, and designs were got out for the folding-wing structure, which opened on a system something like that of a "Jazy-tongs" or a "one-man hood" on a motor-car.

According to the plan, the machine was packed in its compartment all ready for flying, loaded with petrol and bombs. The submarine emerged. The lid was taken off the box. The aviator took his seat and wound a handle which pulled up all the wing-structure into position. The submarine then submerged, leaving him floating. He then started up his engine and flew off.

That was how the scheme worked in theory, and one can see no reason why it should not work in practice, if tackled by a clever designer. Unfortunately, it was not adopted. Perhaps the technical "experts" prevented the scheme from reaching the higher authorities. Perhaps the high authorities—as so often happens in the Navy—had not the intelligence to understand the scheme.

Whether it be adopted in future or not, there is in it the basis of a very dangerous weapon for the next war. Therefore one commends it to the Naval Authorities of to-day. Whoever holds the Command of the Air, there will always be difficulty in preventing a submarine aircraft-carrier from sneaking up in the morning mist, releasing its aeroplane with bombs or torpedoes, and getting away home before it is caught by the defending aircraft.

The Command of the Air.

It is hoped that one has made it clear that whoever holds the Command of the Air will also hold the Command of the Sea. Also, it is fairly obvious that whoever holds the Command of the Sea controls the existence of the British Empire. And, lest the existence of the British Empire should seem but a trifle to our good democrats and trade unionists of to-day, one would point out that whoever holds Command of the Sea also controls the food supplies of the population, including the politicians, the trade unionists, and the Bolshevists. Therefore this is a matter which concerns intimately even our journalists, despite the superior attractions of divorce cases and the latest extravagances of jazz.

Some years ago Major-General Sir David Henderson, then something of a power in connection with aviation, was pleased to sneer at those who believed in the Command of the Air, and declared that such a command could not exist. Not long afterwards Major-General

A view of the Admiralty Arch, Trafalgar Square, the National Gallery and the surrounding district photographed from an Airco biplane. The Admiralty itself is disappearing in the right-hand bottom corner.

Hugh Trenchard, and later Major-General John Salmond, proved that such a Command could and did exist. Thus the Army was taught to recognise the possibility and the value of the Command of the Air.

Unfortunately the Navy never had such a lesson during the war. And the one of our few existing statesmen who believes firmly in Air Power, namely Mr. Churchill, will have nothing to do with the future of the Navy. That is unless he can carry through his great and thoroughly sound scheme for a War Ministry which will control the Admiralty, War Office, and Air Ministry as one team. It remains to be seen, therefore, whether Lord Beatty and his immediate assistants will be able to secure control of the Naval side of aeronautics, or whether the Naval section of the Air Ministry will have to expand gradually till at last it is bigger and stronger than the Navy proper.

The Financial Aspect.

From most points of view it would be better for the Navy to take over all Naval aeronautics, and especially from the financial point of view. If the Air Ministry retains control it will mean that the paltry sum of money voted for the R.A.F. will have to pay and equip the Naval units and will have to pay for all experiments in Naval aircraft. And that means that there will be no real progress in Naval aeronautics for years to come.

If, on the other hand, the Navy takes over what is by all the laws of common sense its proper job, it will pay for everything out of the Navy Vote, as Mr. Churchill did when he built up the R.N.A.S., saved the Aircraft Industry alive, and so ultimately provided the aircraft matériel which saved the British Army in France. And, as one has already remarked, the Navy is the particular pet of the British Public, so there can never be any difficulty about getting enough money out of the Treasury for Naval aeronautics, though there is the greatest difficulty in getting it for the R.A.F.

On the other hand, there is certainly the danger that, if the Navy takes over Naval aeronautics, the Treasury may insist on making such a cut in the R.A.F. Vote (as representing the reduction in cost by transferring the Naval side to the Navy) that it may become impossible to carry on the Air Ministry at all. Whether that would be any loss is a matter which may be debated, but it is certain that it would be better to scrap the Air Ministry than to starve the development of Naval aeronautics so as to provide funds to maintain the Air Ministry. It is also certain that the development of Naval aeronautics has been starved during the past two or three years, ever since the Air Board and the Air Ministry in succession prevented healthy competition between the Supply Departments of the two Services.

Therefore, as the future safety of this country and its food supplies depend on the Command of the Air over the sea even more than on its Command of the Air over land, it seems to be more important that such money as can be secured for aeronautics should be spent on developing the Naval rather than the Military side. And one says this without in the least ignoring the vital importance of developing the aircraft needed by the Army, whose aeroplanes towards the end of the war were painfully behind the times.

Conflicting Interests.

Money must be spent on building and equipping a great Naval Air Fleet. If the Navy is charged with that task we may get the Fleet we need, for the Navy can then with a clear conscience spend money on aircraft and aircraft-carrying ships alike. But if the job is left to the Air Ministry we shall get very little in the way of Naval aircraft: at any rate compared with what we need.

If by any chance the Air Ministry chose to spend the bulk of its available money on Naval Aircraft, it would be trying the Admiralty rather high to expect it to spend millions on aircraft-carrying ships which would, when built, be manned by and operated in the interests of another and junior Service. Can anyone see Their Lordships scrapping a programme of battle-cruisers and super-Dreadnoughts so as to provide a dozen ships for R.A.F. ship-planes?

It hardly seems reasonable that they should do so. They would in fact be much more likely to continue to produce elaborated versions of the warships of to-day. Which is only another reason why the ships, and the aircraft which they carry, and the personnel which runs them both, should all belong to the same Service.

The Lessons of War.

As one suggested at the beginning of these notes, either the Navy must take over and develop Naval aeronautics, or it must degenerate into an expensive superfluity. When one considers what the Navy proper, as distinct from its piratical branches the destroyers and submarines, did in the Great War (so-called) one begins to think that it has been an expensive superfluity for many years.

At best our big ships have been only a bluff which we put over the Germans. All the real work of protecting our food supplies was done by destroyers, armed passenger-boats, tramps, and trawlers, and the great majority of the personnel of these were R.N.R. and R.N.V.R. What those who wore the R.N. uniform had to do with winning the war was very little, and some of them did a great deal towards losing it.

If we had had no Battle Fleet and no Cruiser Fleet at all, but if we had had a big fleet of torpedo-dropping aeroplanes (costing in all about as much as two cruisers) we could have kept the German Fleet as successfully bottled up as we did by our bluff with our Grand Fleet. More than that, we could have "dug the rats out of their holes," as Mr. Churchill proposed to do before he was intrigued out of office. And it would have been our torpedo-planes which would have done it, as Mr. Churchill intended.

It was not the fault of the R.N. officers that so few of them ever saw any real war. And it will not be their fault if in the next war they, in turn, are bottled up in a superfluous fleet. They were all anxious enough to go to war, but the stupidity of our gilt-edged book-writing admirals prevented them.

The R.A.F. itself came into being chiefly through the machinations of Naval officers, and not through any of the R.F.C. people, all of whom were proud to belong to the finest Service in the World. The R.N.A.S. contained two classes of Naval officers, firstly those who were too brainy for the Navy and were impatient of the Navy's ways as dictated by stick-and-string admirals, and secondly those who were too stupid for the Navy and whose only hope of success in life was to go somewhere else for a job. Both classes wished to get out of the Navy, and so, as extremes meet, they combined in pulling strings at home till the R.A.F. was formed, merely because the soldiers were to busy making war to do anything drastic to stop them. Thus the R.N.A.S. was destroyed.

Now the Navy, by means of Naval aeronautics, has the opportunity of becoming a live and useful Service. If it loses this opportunity it will remain a superfluous and expensive Service till, under the pressure of the World's progress, by way of war as usual, it is taken over by the Royal Air Force. One commends its fate to its consideration.—C. G. G.

NAVAL & MILITARY AERONAUTICS

[The " Official Gazette " Notices will be found on p. 1623.]

GREAT BRITAIN.

COURT CIRCULAR.

BUCKINGHAM PALACE, Oct. 31st.

The Right Hon. Winston Spencer-Churchill, M.P. (Secretary of State for War and Air), had an audience of the King this morning. . . .

The Prince Albert, attended by Major Louis Greig, received His Imperial Majesty the Shah of Persia on his arrival at Dover on behalf of the King. . . .

Naval and Military Guards of Honour were mounted on the Pier where the Shah was also received by the Senior Naval Officer, Dover, the General Officer Commanding Eastern Command, and the Air Officer Commanding Southern Area. . . .

The King met His Imperial Majesty on arrival at Victoria Railway Station.

There were also present at the station representatives of the Royal Navy, the Army, and the Royal Air Force. . . .

In the evening the King and Queen gave a Banquet in honour of the Shah of Persia, at which the Prince Albert was present, and the following had the honour of being invited :—The Right Hon. Winston Spencer-Churchill, M.P. (Secretary of State for War and Air), and Mrs. Spencer-Churchill, Air Marshal Sir Hugh Trenchard, Bt. (Chief of the Air Staff).

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointments have been made :—

OCT. 30TH.—Lieut.-Comdr.—R. G. Duke, to "Argus," Oct. 19th.
Oct. 31st.—Engr. Lt.-Comdr.—G. Morgan, to " Pegasus," Oct. 30th.

* * *

OPERATIONS IN RUSSIA.

It is reported that on Oct. 26th a British seaplane was shot down off Kronstadt and captured by the Bolshevists. A C.M.B. which was sent out to help the crew arrived too late.

DEMOBILISED.

H.M. Seaplane-carrier "Empress" (Comdr. C. V. Robinson, R.N.) has returned to England from the Eastern Mediterranean and will be paid off at Chatham. She will then be refitted for commercial use. "Empress" was one of the three cross-Channel steamers which were requisitioned by the Admiralty in early 1914 and fitted out as seaplane-carriers. With her sister-ships "Engadine" and "Riviera," "Empress" took part in the air raid on Cuxhavn and Wilhelmshavn on Christmas Day, 1914, but the most part of her war service has been done in the Eastern Mediterranean.

NO. 8 SQUADRON REUNION.

Number 8 Naval (208 R.A.F.) Squadron's Reunion Dinner on November 1st was a great success. Something in the region of 200 officers and men were present and the number of men who turned up provided the strongest possible evidence of the esteem in which the three successive C.O's—Squadron Commander Bromet, Major Draper, and Major Smart—were held by those under them. All three C.O's were present, with Squadron-Leader Bromet in the chair.

In addressing those present, the Chairman made the interesting proposal that the Squadron should form a kind of little Co-operative Society on its own account, so that those who were doing well in the World might lend a hand to help comrades who were down on their luck. The proposal was received with enthusiasm, and as soon as the scheme has been properly developed one hopes to refer to it more fully. In the meantime those who are interested are invited to communicate with Mr. F. Hammond (late of the Transport Section, No. 8 Squadron), at No. 10, Ashbourne Grove, East Dulwich, S.E.

AIR FORCE.

THE FREEDOM OF THE CITY.

On Oct. 28th Capt. H.R.H. the Prince Albert, K.G., R.A.F., received the Freedom of the City of London.

A ROYAL VISIT.

On Nov. 3rd H.M. the Shah of Persia, accompanied by Capt. H.R.H. the Prince Albert, K.G., R.A.F., visited the Royal Aircraft Establishment at Farnborough.

R.A.F. OFFICERS' BOARD.

The Air Ministry announced on Oct. 31st that a Selection Board has been formed in order to advise the Air Council as to the award of promotions to post-war R.A.F. officers, and to decide the procedure to be followed in future for the periodical selection of officers for promotion. The following are the members of the first Board :—

Air Marshal Sir H. M. Trenchard, Bart., K.C.B., D.S.O.
Rear Admiral C. F. Lambert.
Air Vice-Marshal Sir J. M. Salmond, K.C.B., C.M.G., C.V.O., D.S.O.
Air Vice-Marshal A. V. Vyvyan, C.B., D.S.O.
Secretary—Squadron Leader H. L. Jackson.

THE FLYING SERVICES FUND.

The following letter has been written by H.R.H. Prince Albert, K.G. :—

I am appealing for further subscriptions to the Flying Services Fund, which is administered by the Royal Aero Club.

This Fund was established by the Club in 1914 for the benefit of officers and men of the R.N.A.S. and R.F.C. (now the R.A.F.) who were incapacitated on active service, and for the widows and dependents of those who were killed.

The expenses of administration are borne by the Royal Aero Club, and all subscriptions are devoted entirely to those requiring relief.

The subscriptions received amount to £15,000 and the sums which have been expended to date in grants, allowances and the education of children amount to £6,000. The monthly liability for grants, allowance, etc., is about £400, and the education of over 300 children of dependents calls for an increasing expenditure commensurate with their ages. The Committee are most anxious to ensure a proper education for the children of all dependents, and it is mainly for this purpose that further subscriptions are required

It is estimated that the necessities of the Fund will require it to be administered for at least ten years, and in view of the very real assistance we have been enabled to give to so many deserving and distressing cases, I appeal to all to subscribe liberally to this Fund.

Subscriptions should be forwarded to Lord Kinnaird, K.T., Hon. Treasurer, Flying Services Fund, Barclays Bank, Ltd., 4, Pall Mall East, London, S.W.1, or to me at the Royal Aero Club, 3, Clifford Street, London, W.1.

(Signed) ALBERT, Chairman.

The Royal Aero Club, 3, Clifford Street,
London, W.1. Oct. 30th, 1919.

AT ST. RAPHAEL.

On Oct. 28th Capt. Llewellyn, R.A.F., left St. Raphael for Taranto.

It was reported from St. Raphael on the same date that Lieuts. Combes and Crichton, R.A.F., who had left ten days previously for Taranto, were missing. This statement another paper contradicted, but nothing official has been announced.

From St. Raphael comes the news that Major Maclaren, R.A.F., who left there on Oct. 24th, has arrived in Egypt, his destination, and also that Lieut. Alfred Sinclair, R.A.F., of the Royal Air Force Flying School has left in a seaplane for Egypt via Pisa.

H.M. AIRSHIPS.

It is now understood that H.M.A. R.32, R.33, and R.34 are expected at the Howden Air Station, Yorks, in the course of a few days.

R.A.F. RUGBY.

On Saturday Nov. 1st, the R.A.F. Rugby football team played the Old Merchant Taylors at the Old Deer Park, Richmond. The result was : O.M.T., 1 goal 3 tries—14 points; R.A.F., 1 goal 1 try—8 points.

The game was a very close, hardly contested one, in which combination proved the deciding factor. The Air Force were not together at all and were very scrappy. The forwards played a good game in the open, but were not together in the tight scrum and did not control the ball in the loose scrums. The ball was very slow in coming away from the R.A.F. scrum, thus hardly giving the three-quarters a chance. The O.M.T. played a good hard game and thoroughly deserved their victory.

The R.A.F. team was : Flg. Officer Damant, full-back; Flg Officer Smith, Flt. Lt. Thomas, D.F.C., Sqdn. Leader Neale, M.C., Sqdn. Ldr. Evill, D.S.C., three-quarter backs; Flying Officer Dalziell, Flying Officer Farrington, D.S.O., half-backs; Flt. Lt. Wakefield, Flt. Lt. Thom, A.F.C., Flt. Lt. Simpson, Flt. Lt. Munday, Flt. Lt. Seroggs, Flt. Lt. Whitworth, Flying Officer Rose, and Serjt. Smith, forwards.

BROOKLANDS.

A correspondent writes :—

A small fire broke out on the aerodrome on Sunday last (Oct. 26th), when one of the few remaining wooden buildings, used as a cookhouse and messroom, was destroyed. The Wey-

MARTINSYDE

DESIGNERS OF THE FAMOUS

F4 FIGHTER

bridge Fire Brigade luckily succeeded in preventing the fire from spreading to the hangars and other buildings—J. F. S.

To 27 Squadron.

A 27 Squadron (B.E.F.) reunion dinner will be held in London on Dec. 13th.

As all addresses are not known, would officers who have not received information, but who are desirous of attending, please communicate before Dec. 1st with Capt. E. C. Raworth, Lenzie House, East Parade, Harrogate?

To 56 Squadron.

The members of 56 Squadron who subscribed for the purchase of the silver model aeroplane presented to the late Major J. T. B. McCudden, V.C., D.S.O., M.C., M.M., in 1918 by the Squadron in honour of his splendid work with the Squadron, will be interested to hear that after much travelling about with the Squadron abroad, the model has now come into the possession of Mr. W. H McCudden—Major McCudden's father.

Mr. McCudden is, of course, very glad to have the model and wishes to acknowledge to all those who subscribed to its purchase his appreciation of their good feeling towards his late son.

FRANCE.

Lieut. Boussod, of the Military Aeronautics Service, arrived at Casablanca on Oct. 24th in order, it is stated, to find a suitable place between Kenifra and Mazagan for the erection of an airship hangar. It is rumoured that the Government intend to open an airship service over the circuit France-Morocco-Algeria-Tunis-France.

Algerian Affairs.

It is reported from Paris that one of the four French escadrilles which have reached Teniet-el-Hatel was attacked by a strong force of Beni Warain. A squadron of aeroplanes thereupon bombarded the villages of the neighbourhood, while a detachment made a sortie. The rebel chief, El Rogui, was seriously wounded and his troops were dispersed.

ITALY.

The Rome-Tokio Flight.

The Italian correspondent of The Aeroplane writes:—

The Rome-Tokio regularity flight seems likely to come off towards the end of November. The name of Commander Casagrande is now mentioned as a likely chief for the trip, and certainly some two or three Caproni triplanes—not biplanes as was incorrectly printed in a recent number of The Aeroplane—will accompany the SVAs. These, at any rate, are to carry parachutes, one believes of a new Italian design.

Commander Casagrande took a large part in the "Giovane Italia" work of landing men behind the Austrian lines. One who took part in this very sporting sideline tells me that the more dangerous members of the conspiracy landed from the seaplanes by ropes onto treetops. They carried enormous sums of money, and signalling was carried out by the display of washing—not always on washing day. The local habit of drying sheets on the ground assisted things happily.

Aviation in Libia.

Colonel Prandoni, who was in command of the very first squadron flights on Farmans carried out in this country years before the war, is now C.O. in Libia. As might have been reckoned upon, a lot of organising is being done in that colony. Some flights of unusual interest were recently chronicled in The Aeroplane.

An aerial survey of the routes from Rome to Asmara (Eritrea) is being undertaken. The Ministry of Transports is to be congratulated.—T. S. H.

RUSSIA.

Official Communiques (Bolshevist).

Oct. 31st.—In the Finnish Gulf coastal region there has been an artillery duel. In the course of the fighting an enemy aeroplane, which was correcting the fire, was brought down.

A recent message from Odessa to the "National Tidende" stated that an agreement has just been concluded between the Russian North-West Army and England, according to which England will support Yudenitch's action against Petrograd by supplying aeroplanes, tanks, etc.

The Attack on Krasnaya Gorka.

On Oct. 28th a combined naval and military attack upon the fortress of Krasnaya Gorka was opened. The visibility being poor, it was not possible to use aeroplanes for artillery observation. An aerial attack was made on the fortress before the bombardment opened and one hundred and forty 20-lb. bombs and forty 65-lb. bombs were dropped. It is reported that two barracks were destroyed and other damage done, but this is not official. It is also stated that the anti-aircraft defences of this town and Kronstadt give evidence of German gunners, guns, and shells.

The correspondent of the "Times" newspaper, writing on Oct. 30th from Björkö, of the British Naval Force co-operating with the Esthonians, says concerning the Krasnaya Gorka:—

"A photograph just taken shows that the westernmost six-inch battery has been badly smashed by air bombs, but the recent anti-aircraft fire was too accurate to allow a severe bombardment by the machines at our men's disposal.

"Indications of the presence of Germans in the fortress of Krasnaya Gorka have been noted by our flying men, who report that the guns are carefully treated and that the fortifications are in good repair.

"The British air force, which numbers less than a squadron, is under Major Donald, the well-known Rugby football player, while the machines are in the direct charge of a South African, Lieut. Fairweather. The seaplanes are carried in the "Vindictive," and are under Capt. Grace, son of the famous cricketer."

TURKEY.

It is reported from Turkey that an aeroplane which recently descended at Kovno contained as passengers Lieut. von Geisner, Talaat Pasha and Djemal Pasha. Two other Germans were in the machine besides the first named, and all are said to have been attempting to escape.

A local newspaper, giving the information under reserve, says that the report is current there that Talaat and Djemal, fearing that the German Republic would hand them over to the Entente Powers, had recently decided to escape and to join Enver in Turkestan or Transcaucasia *via* Soviet Russia.

THE AUSTRALIAN AEROPLANE COMPETITION.

THE ALLIANCE AEROPLANE COMPANY'S ENTRY FOR THE AUSTRALIAN AEROPLANE COMPETITION.

This machine is an Alliance P.2, built by the Alliance Aeroplane Co., Ltd. It is fitted with a 450 h.p. Napier "Lion," is said to have a speed of 135 m.p.h., and is equipped with two wireless sets. The non-stop range of the machine is 3,000 miles. Details for comfort have been so carefully considered that even the wings and struts have been painted green to be restful to the eyes. The pilot and navigator are respectively Lieut. Roger Douglas, M.C., D.S.M., Aus.F.C., and Lieut. Ross, Aus.F.C.

The Alliance Entry.

Two pilots of the Australian Flying Corps were ready to start their flight to Australia on Oct. 31st, but the weather was not good enough. They are Lieut. Roger Douglas, pilot, and Lieut. Ross, navigator. Their machine is an Alliance P.2, built by the aeroplane company of that name, and is fitted with a 450-h.p Napier "Lion" engine.

Lt. Douglas enlisted in the A.I.F. at the beginning of the war, and was at the landing on Gallipoli with the Australian Machine-Gun Battalion. In France, as a serjeant, he was awarded the D.C.M. at Pozieres in 1916, and after receiving his commission in the field he gained the M.C. at Polygon Wood in Sept., 1917. He then joined the Aus. F.C., and after doing good work in France, instructed on S.E.5s. He also passed through a navigation course at Andover.

Lieut. Ross received his commission and pilot's wings in Oct., 1916. He was with the Aus. F.C. in France until Sept., 1918, when he was wounded whilst in a squadron of S.E.5s. He has had considerable training in navigation.

Both men have been working together since the Armistice. Lt. Douglas conceived the idea of flying home in 1916, and

From the early days of aviation

The "Bristol" Aeroplanes

have been famous for

QUALITY
RELIABILITY
and
ENDURABILITY

The
"BRISTOL" FIGHTER
Type F2.B.

In September, 1917, a "BRISTOL" Fighter was delivered from the "BRISTOL" works and put into commission in the fighting area. It was unfortunately landed in Holland and soon afterwards was acquired by the Dutch Government. From that time until now, though in continuous use by Dutch pilots, it has never been repaired or renovated in any way, and every unit is exactly as when it left the "BRISTOL" works. Even the "Cellon" dope has never been renewed.

AEROPLANE CO., LTD.
FILTON - BRISTOL.

Telegrams: "Aviation, Bristol." Codes: A.1., A.B.C. & Moreing. Telephone: 3906 Bristol.

Lieut. Roger Douglas, M.C., D.C.M. (left), the pilot, and Lieut. Ross, the navigator, of the 450 h.p. Napier-Alliance biplane.

immediately the Armistice was declared he set out to obtain a machine capable of doing the journey.

He has had some weeks' experience in flying an Alliance aeroplane fitted with a 450-h.p. Napier engine, and is confident that he could not have secured a better machine for this flight. It is particularly steady in the air, has ample reserve of power, and the engine, with many remarkable performances to its credit, can be relied upon to do all that is asked of it.

Sufficient food will be carried to last for five days. The machine is said to have a non-stop range of 3,000 miles.

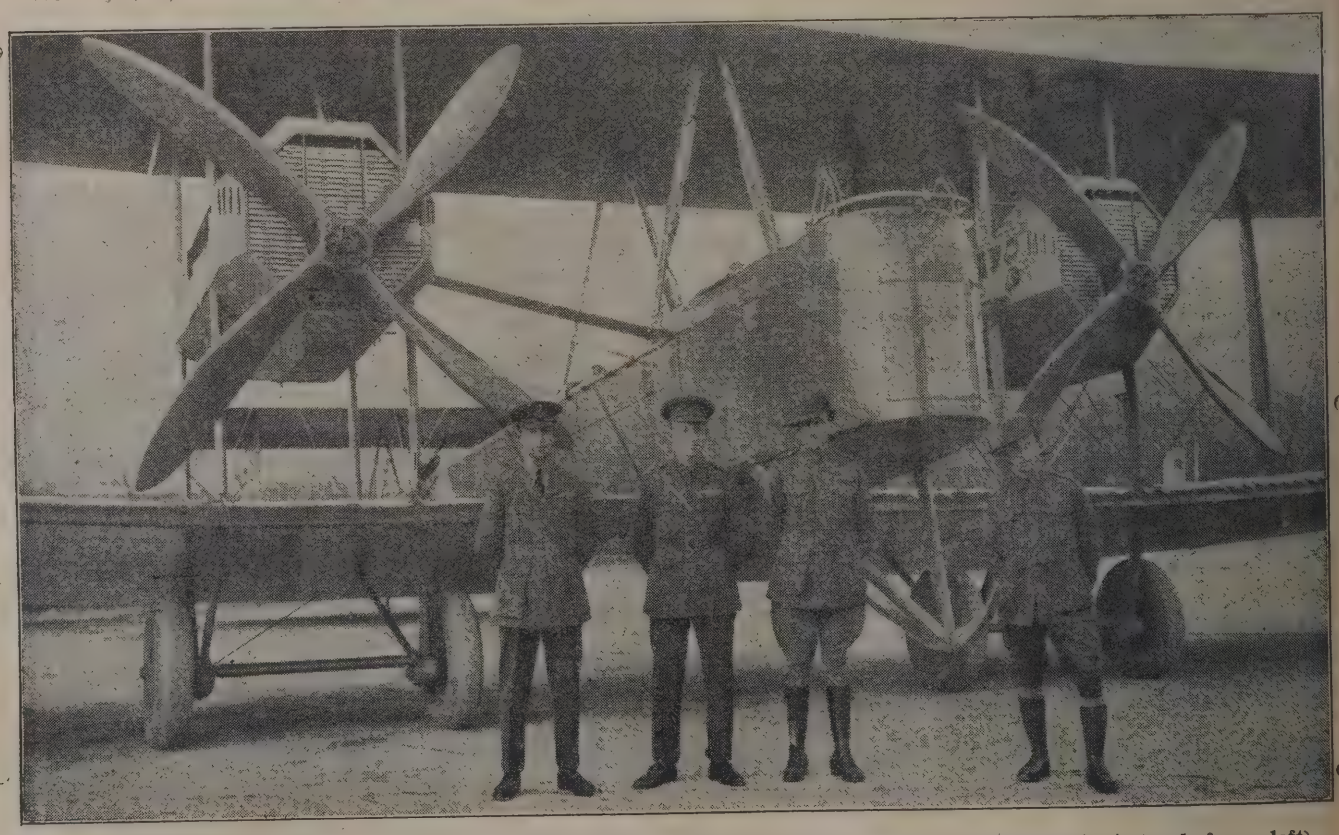
THE VICKERS ENTRY.

Vickers, Ltd., have entered a standard Vickers-Vimy-Rolls bomber (two Rolls-Royce Eagle Mark VIII engines), which will be piloted by Capt. Ross Smith, M.C., D.F.C., A.F.C., and his brother, Lieut. Keith Macpherson Smith. Both Capt. and Lieut. Smith were born and educated at Adelaide, South Australia.

At the outbreak of war Capt. Ross Smith enlisted in the 3rd Australian Light Horse as a private, and sailed with the first Australian Expeditionary Force, landing in Egypt in December, 1914, and after four months on Gallipoli he gained his commission. In October, 1916, he transferred to 67 (Australian) Squadron, R.F.C., as an observer, and qualified as a pilot in Egypt in July, 1917. He then rejoined his old squadron, now known as No. 1 Squadron, Australian Flying Corps, stationed in Southern Palestine, and remained there until the Armistice

In December, 1918, he accompanied Major-Gen. Sir W. G. H. Salmond, K.C.M.G., C.B., D.S.O., and General A. E. Borton, C.M.G., D.S.O., A.F.C., on the first flight from Cairo to Calcutta, and after arriving at Calcutta proceeded with General A. E. Borton on his reconnaissance for aerodromes in Burma, Siam, Malay States, and the Netherland East Indies. He returned to England about a month ago.

Lieut. Keith Macpherson Smith, R.A.F., will act as reserve pilot and observer. On arrival in England during 1916 he joined the R.F.C. as a cadet, shortly after becoming a pilot, and was serving as an instructor in the North of England until the Armistice.



Capt. Ross Smith and his brother will be accompanied by Serjt. J. W. Bennett, A.F.M., M.S.M., and Serjt W. H. Shiers, A.F.M., who will act as mechanics. Both have seen service with the R.F.C. and both accompanied Major-Gen. Salmond, General Borton, and Capt. Ross Smith on their original flight to the East, and afterwards served in the recent Afghan campaign.

The aeroplane is identical with those supplied to the Royal Air Force, and is similar to the machine used by Capt. Sir John Alcock, K.B.E., D.S.C., except that for this flight a smaller petrol capacity is required. Petrol is drawn from the main petrol tanks by two Vickers Mark II centrifugal petrol pumps and delivered to the service tank, which forms a section of the top plane, whence it falls by gravity.

The general dimensions of the aeroplane are as follows:—span, 67 ft.; overall length, 42 ft. 8 in.; overall height, 15 ft. 3 in.; gap, 10 ft.; chord, 10 ft. 6 in. The maximum speed is over 100 miles per hour and the cruising speed is about 90 miles per hour. The weight of the machine empty is 3 tons, and the total weight fully loaded is nearly 5½ tons.

THE SOPWITH MACHINE.

Capt. Matthews, who left England on Oct. 21st, is held up by fog and rain near Cologne

The Vickers' "Vimy" biplane (two 375 h.p. Rolls-Royce engines) on which Captain Ross-Smith (second from left), Lieut. Keith Smith (first), Serjeant Bennett (third), and Serjeant Shiers (fourth), are attempting to fly from England to Australia.

THE PILOT OF THE SOPWITH-JUPITER RACER,
Mr. H. G. HAWKER,

SAYS

"THE ENGINE IS THE SMOOTHEST RUNNING RADIAL I HAVE EVER SEEN. THERE WAS NO VIBRATION OBSERVED ON ANY WIRE OF THE MACHINE.

AS REGARDS POWER, I CAN ONLY SAY WE HAVE HAD THE ALMOST UNIQUE EXPERIENCE OF FINDING EVERY PROPELLER TURNING AT MORE THAN ITS DESIGNED SPEED."

THE CONTINENTAL AIR SERVICES.

THE AIRCO SERVICE.

Aircraft Transport and Travel, Ltd., have completed their tenth week of regular flying on the London-Paris service. Out of 154 flights scheduled, 147 have been successfully accomplished. Only one flight has been prevented altogether, and six others have been interrupted, three owing to weather and three on account of mechanical breakdown. The service has been carried out on thirteen days noted officially as unfit for flying.

Date.	Type.	Pilot.	Left Hounslow	Arr. Paris.	Left Paris.	Arr. Hounslow.	Pass.

On Oct. 27th the wind attained a velocity of from 40-50 m.p.h. Major Patteson, flying from Le Bourget with four passengers, owing to the strength of the gale landed at Lympne, near Folkestone, at 3.40 p.m. The passengers and parcels proceeded to town by rail. The emergency arrangements to meet such occurrences worked quite well, the Railway Co. delaying a train to enable the passengers and goods to be taken on board.

On Oct. 29th there were snowstorms, high-velocity winds, and bad visibility, one of the worst days experienced since the opening of the Airco service. The D.H.4a, piloted by Lieut. Tebbit from Le Bourget with one passenger, alighted at Biggin Hill, near Bromley Kent, at 3.15 p.m., owing to the stress of weather.

A similar machine, also flying from Paris, piloted by Lieut. Shaw, with one passenger, was compelled to alight in the sea close beside a small coasting vessel, the "Harlech," the crew of which took pilot, passenger, and parcels on board. The steamer put into Weymouth on the morning of the next day, and the express goods, after being passed by Customs, were sent to London by rail. The only inconvenience suffered by the pilot and passenger was wet feet. The machine was lost.

On Nov. 1st Lieut. Shaw left Le Bourget with express parcels. He was forced to land at Lympne owing to a broken petrol pipe. After making the necessary adjustment the pilot proceeded on his journey and reached Hounslow at 5 p.m.

THE HANDLEY PAGE SERVICE.

On account of the gale on Oct. 27th the Handley Page machine flying from Paris landed at Marden, in Kent. The journey took 4½ hours. On the same day Capt. W. L. Hope flew from Hounslow to Brussels in 2 hr. 25 min.

On Oct. 28th two women, aged respectively 75 and 73, flew from Brussels to London in a gale in 5 hours.

During the week ending Oct. 29th the Handley Page aeroplanes carried 38 passengers and 2,172 lb. of freight on the London-Paris route. In the same period 21 passengers were carried on the London-Brussels service, with 630 lb. of luggage.

On Oct. 30th the machine which left Paris at 11.15 a.m. during a snowstorm reached Hounslow at 2.45 p.m.

On Oct. 31st freight was carried to Belgium for the first time, the restrictions having been removed. On that day 15 passengers and 657 lb. of freight were carried on the London-Paris and Brussels routes. The machine flying from Brussels to London did the journey in 2 hr. 15 min.

From Nov. 3rd the Handley Page machines were scheduled to leave Hounslow for Paris and Brussels at 11 a.m. instead of at noon. Passengers will be picked up at the Piccadilly Hotel by motor-car at 9.30 a.m.

THE B.A.T. SERVICE.

On Oct. 27th all the machines on the Continental-London services were unable to make Hounslow the first landing-place in their flights from the Continent. There was a gale of 40-50 m.p.h. The British Aerial Transport Co.'s commercial machine, piloted by Major C. Draper, landed at Lympne, in Kent, having flown from Amsterdam.

THE LONDON-PARIS BEST.

The following letter has been received:—

Sir,—May we point out, with reference to the letter from Messrs. Martinsyde in your last issue, that we had no intention of claiming that Capt. Gathergood's 1 hr. 20 min. flight from Hounslow to Le Bourget on Oct. 16th was a speed record as between London and Paris. Obviously, in view of the 1 hr. 15 min flight of the Martinsyde from Hendon to Buc, with which of course we were familiar, it was not.

Capt. Gathergood's flight was made in connection with the daily operation of the London-Paris air express, and in issuing to the Press our usual nightly bulletin we added a few lines chronicling this flight and pointing out that 180 miles an hour—the average speed attained by Capt. Gathergood—was the fastest so far attained on the London-Paris route: meaning quite obviously the route over which we are flying daily between Hounslow and Le Bourget, and which is of course, in effect, the only route which aircraft now traverse commercially.

A copy of our bulletin, as printed in the news columns of the "Times," is appended herewith for your perusal. Had it been our intention actually to claim a London-Paris speed record the wording of our paragraph would, of course, have been very different.

In the page advertisement in the technical Press, of which Messrs. Martinsyde specially complain, though here again there is no claim to a record, the fact that for the sake of brevity the preceding paragraphs from the "Times" announcement were omitted might, it could perhaps be argued, make it less clear that what we were claiming was merely the fastest time between Hounslow and Le Bourget; and if any misapprehension should have arisen in this regard we desire naturally to express regret.

(Signed) ARTHUR E. TURNER,
Director.

Copy of Airco Bulletin mentioned above:—

LONDON-PARIS AIR EXPRESS.

Two specially chartered Airco machines, in addition to the scheduled 12.30 p.m. service, were required yesterday to deal with the passengers and parcels from London to Paris.

The machine on the 12.30 p.m. service from Paris, carrying passengers and express goods, alighted at Hounslow at

London-Paris
Air Express

Summary of First Ten Weeks' Flying.

August 25th, 1919, to November 1st, 1919.

Flights Scheduled	154
Flights accomplished	147
Prevented by weather	1
Interrupted by weather	3
Interrupted by mechanical defects	3
Number of Miles flown	37,750
Average Speed (M.P.H.)	105

The following is a summary from official reports of the weather flown through during these ten weeks.

Days favourable for flying	17
„ unfavourable for flying	30
„ noted officially as "unfit" for flying	13

LONDON:
AIRCRAFT TRANSPORT & TRAVEL, LTD.,
25-27, Old Queen Street, S.W.1.

Full particulars regarding rates and freights can be obtained from Aircraft Transport and Travel, Ltd., 25-27, Old Queen Street, S.W.1, or from the American Express Co., Queen Street and Haymarket; Thos. Cook & Son, Ludgate Circus, E.C., and 38-39, Piccadilly, W.; General Transport, Ltd., 52, Cruiched Friars; J. Jackson & Sons, 7-8, Charing Cross, and King William Street, E.C.; Henry Johnson & Sons, 18, Byward Street, and Beak Street, W.; Lepaerial Travel. Piccadilly Circus (Criterion Corner); Carter Paterson & Co., 6, Maddox Street, W., and 3, Cannon Street, E.C.; and Hernu, Peron & Co., 98-100, Queen Victoria Street, E.C.

PARIS:
COMPAGNIE GÉNÉRALE TRANSAERIENNE,
118, Champs Elysées.

2.54 p.m., after having combated successfully a 50-miles-an-hour wind in the Channel.

A racing Airco machine, piloted by Capt. Gathergood, leaving for Paris at 12.30 p.m. with some specially urgent dispatches, accomplished the flight from Hounslow to Le Bourget in 1 hr. 20 min., at the rate of 180 miles an hour, which is the greatest speed attained so far on the London-Paris route.

THE BLACKPOOL-MANCHESTER SERVICE.

The daily air service between Blackpool, Southport, and Manchester carried out during the recent summer by A. V. Roe and Co., Ltd., came to an end on Sept. 30th. Out of 222 flights scheduled, 194 were accomplished. Twenty-eight were prevented by weather and none interrupted by mechanical trouble. The total number of miles flown was 8,730.

The service was started three and a half weeks after civil flying was legalised in Great Britain. It was the first daily service by air to be instituted in this country and to be mentioned in railway guides.

At noon each day at least one Avro left the sands at South Shore, Blackpool, and headed for Southport, which was reached at 12.15 p.m. At 12.45 the machine descended at Alexandra Park, Manchester. The return flight started from Manchester at 2 p.m. The fare was five guineas for a single and nine guineas for a return ticket.

By degrees the service became popular and before long it was paying its way.

Whatever the Post Office may think, the people of Lancashire have no doubts as to the reliability of an air service carried out by Avro aeroplanes.

DOVER.

A Fairey seaplane belonging to Lieut.-Col. G. L. P. Henderson, M.C., A.F.C. (late R.A.F.), was wrecked on Dover beach in a gale on Oct. 30th. Col. Henderson started on a flight from Southampton to Amsterdam on the previous day, and had landed at Dover on account of the bad weather.

HALIFAX.

Mr. Herbert Sykes, O.B.E., of the Central Aircraft Company, arrived at Lightcliffe, near Halifax, on the afternoon of Oct. 26th, after a long flight from London. A temporary aerodrome was laid out in Stoney Lane, Lightcliffe, and a flying week was held.

Two machines, one piloted by Mr. Sykes, left Northolt aerodrome on Oct. 25th in very bad weather, heavy rain and fog. A landing was made at Bedford, and owing to difficulties it was decided to spend the night at Huntingdon.

The journey was resumed on the next day and the machines landed at Lightcliffe at 5.10 p.m.

On Oct. 27th Mr. Sykes made an exhibition stunting flight over Halifax.

LONDON.

HENDON.—On Saturday, Nov. 1st, Teniente Fernando de Mendoza and Teniente Fernando Navarro Capdevile, members of the Spanish Aviation Mission at present in this country, accompanied by Lieut.-Col. Spenser Grey, D.S.O., visited Hendon for the purpose of inspecting the machines of the British Aerial Transport Company. Major C. Draper, D.S.C., exhibited the B.A.T. saloon passenger and commercial aeroplane and also the B.A.T. Bantam. The visitors were greatly impressed with both machines, especially the evolutions of the Bantam.

HOUNSLOW.—The Air Ministry announced on Oct. 30th: The following "Notice to Airmen" has been issued:—

"Hounslow aerodrome is temporarily equipped for night-flying. Each evening, for a period at sunset, a lighthouse in the aerodrome will give three flashes every ten seconds in the following order: flash, one second; eclipse, one second; flash, one second; eclipse, one second; flash, one second; eclipse, five seconds. Ground searchlights and landing flares will also be displayed.

"These lights will be provided at any time during the night if notification is made to Hounslow that machines intend to land, or if a machine is heard in the air. These arrangements are subject to alteration, of which due notification will be given."

The mechanism of the lighthouse does not differ substantially from that of those used at aerodromes overseas during the war. It is of French origin and burns acetylene gas. The vertical beam is thrown from the flame reinforced by powerful reflectors. The lamp is so designed that there is no glass immediately above the burner.

The lighthouse is at present in an experimental stage. The next station to be equipped for night-flying will be Lympne.

NORTHOLT.—On Oct. 31st the Basuto chiefs who are on a visit to this country were taken up for flights at the Northolt Aerodrome. The Paramount Chief is named Griffith. Both he and his fellow-chief, Suko, are of bulky build.

It took several air mechanics to get Griffith into his flying kit, and as there was not a suit large enough for Suko he had to be wrapped in white overalls. Both chiefs laughed so heartily while they were being strapped up that their hilarity threatened to hold up the flight.

They were eventually wedged into the cockpit, and soon after leaving the ground encountered a heavy rain-storm. Griffith ducked behind the wind-screen, but Suko could not get all his massive frame under cover and was stifled by the rush of air and rain. Being a practical man he covered his nose with his goggles and thereafter thoroughly enjoyed the half-hour flight.

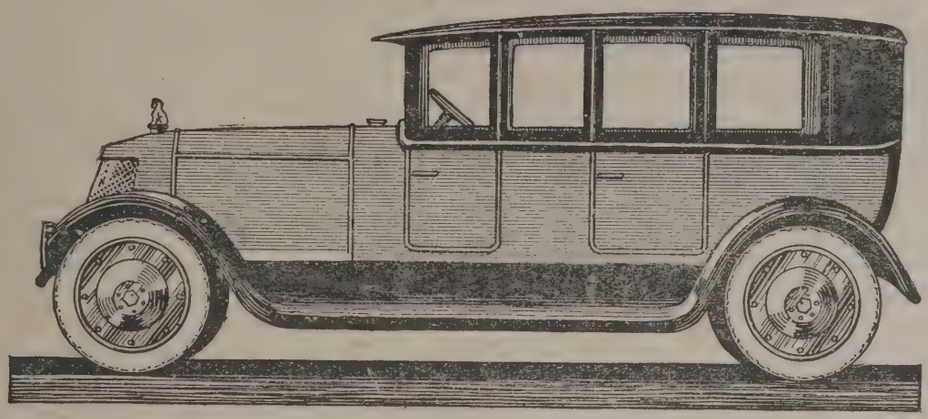
The Paramount Chief said he was very proud of being the first of his race to fly. The rest of the party were taken up for shorter periods.

WINDERMERE.

It has been decided to keep the Avro seaplane station at Bowness open during the winter. In addition to taking up passengers, Capt. Howard Pixton is prepared to train a limited number of pupils during the winter. Capt. Pixton is almost the *doyen* of all pilots now regularly flying. His own flying ticket dates from 1910, in which year he joined Mr. A. V. Roe and went with him to America. Capt. Pixton won the Schneider Cup in 1914, and has also won many other prizes for flying contests.

CANADA.

CIVIL AERODROMES.



Colonel Biggar, vice-chairman of the Canadian Air Board, has announced that municipalities will be expected to erect their own landing grounds for aircraft. Saskatoon has already a civic aerodrome.

CREATING A PRECEDENT.—The first of the inhabitants of Basutoland to fly were Griffiths, the Paramount Chief (in front) and Suko, his fellow-Chief. In very unpleasant weather of mist and rain they made a half-hour's flight over London in an Avro biplane owned by the Central Aircraft Co., at Northolt on Oct. 31st. On account of his massive stature, tight lacing was necessary to get Griffiths into flying kit. Suko was too large for ordinary clothes and had to be rigged up in a capacious dustcoat. Dressing the Chiefs for the flight took half an hour, as they were very ticklish, and their continued hilarity almost prevented them from going up at all.

The ARMSTRONG SIDDELEY Six Cylinder Car

R.A.C. Rating 29·5 H.P. *Treasury Tax £8 8 0*

Olympia Stand 72.

THE new Armstrong Siddeley 6-cylinder car is of entirely original design and embodies the experience gained during the past four years in the production of aircraft engines aggregating over 2,000,000 (two million) horse-power.

¶ You cannot buy a better car.

¶ It is a motor carriage of high efficiency, stately appearance, ample power, and constructed of the best materials. It is light. It is comfortable. It is dependable. It runs smoothly, silently and is easily managed.

¶ Maintenance costs are small. Three years' free inspection.

¶ The low price at which it is sold is made possible by its simple design and by quantity production.

Godbolds

SOUTH AFRICA.

A combination of important interests connected with commercial aviation has been effected by the amalgamation of the South African Aerial Transports, Ltd., and the South African Aerial Navigation Co., the result of which is that Colonel Armes, C.M.G., Major Miller, D.S.O., and Captain H. Tatton will direct the policy of the South African Aerial Transport, Ltd. The additional technical staff includes Major Honnett, Major Young, D.F.C., Captain Ross, D.F.C., Bar., Lieut. Thompson, D.F.C., and Lieut. Rutherford.

The Johannesburg "Star" of Oct. 2nd stated that flying would be undertaken in Johannesburg within a fortnight. The machines they have at present are Avro biplanes with 110-h.p. Le Rhône engines, and carry certificates of airworthiness issued by the British Air Ministry. As the company receives further machines the services will be rapidly extended.

The company's offices will be situated at 26-29, Exploration Buildings, Johannesburg.

CHINA.

The Purchase of Vickers' Aeroplanes.

The Chinese Government have purchased 100 "Vickers-Vimy-Commercial" biplanes for use in commercial aeroplane services. Their speed is 100 miles an hour and the endurance five hours. They carry sixteen passengers (in addition to the pilot) or one and a half tons of goods.

DENMARK.

The Danish correspondent of THE AEROPLANE writes :—

The first instance of commercial aerial photography work has now taken place here, the Sleswig pilot Schmidt having flown over Slesvig with a photographer, who took views in a Sablatnig biplane of the Danish Air Express Co. for a book to be issued in commemoration of the return of Sleswig to Denmark. A mechanic and one of the authors of the work were passengers in the flight.—E. H.

FINLAND.

It is stated in the "Times" of Nov. 1st that an air route covering practically the whole length of Finland has been started from Sortavala on the Lagoda to Murmansk. British and French aeroplanes are said to be used.

FRANCE.

Landing-grounds in France.

The Société de Navigation Aérienne has made a list of landing-grounds in France available for general use. The list is as follows, but it must be understood that the places enumerated are not the only aerodromes in France, but are those which are entered in the books of the S.N.A.

1. Landing-grounds without accommodation or fuel store :—Avignon (Pujaut), Lille (Rouchin), Angers, Angoulême, Bar-le-Duc, Buc, Chambéry, Chaumont, Commercy, Evreux, Joigny, Le Mans, Montelimar, and Nice.

2. Unoccupied landing-grounds with accommodation :—Ambérieu, Orly, Amiens (Bertangles), Belfort (Chaux), Colmar, Douai, Epinal, Habsheim, Hageneau, Le Perthe, Besançon (Le Valdehon), Maubeuge, Neu-Brisach, Ochey, Sarreguemines, Schlestadt, Strasbourg (Neuhof), Thionville, Toul, and Villeneuve-les-Vertus.

3. Military landing-grounds occupied and with accommodation and fuel store :—Avor, Le Bourget, Cazaux, Chateauroux, Clermont-Ferrand (Aulnat), Courban, Dijon, Etampes, Metz (Frescaty), Issoudun, Istres, Luxeuil, Lyon, Nancy (Mabzeville), Pau, Romilly, Saint-Cyr, Saint-Dizier, and Tours. In this category should be included seaplane stations (French Navy) : Aubagne, Brest (Guiparas), Cherbourg (Monteburg), Rochefort, and Saint-Raphael.

4. Landing-grounds of the S.N.A. with accommodation and fuel store :—Bordeaux (Theynac) and Le Bourget.

A Paris-Casablanca Flight.

Lieut. Boussotrot, who piloted the Farman "Goliath" in the attempt to reach Dakar, left Tousseus-le-Noble on Nov. 1st, flying the tiny Farman biplane "David" (40 h.p. engine). He is alone and intends to fly to Casablanca *via* Bordeaux, Biarritz, Saint Sebastien, Vittoria, Madrid, Cordova, Seville, Gibraltar, Tangiers, and Rabat. If he reaches Casablanca safely he intends to make a tour throughout Morocco calling at Mogador and Agadir. Later he will return to Paris by Gibraltar, Barcelona, Madrid, Perpignan, Toulouse, Marseilles, Avignon, Lyon, and Dijon. No special preparations are made for this flight, and he will be for a space a genuine tourist of the air. He is to keep a careful diary of his flight in order that his experiences may be of value to others.

Aerial Navigation Firms.

The following list of French companies engaged in aerial navigation, extracted from "L'Auto," is published for information :—

Société des Avions H. et M. Farman, 167, Rue Silly, Billancourt.

L'Aero Navale, 46, Rue de Villier, Levallois-Perrot.

Compagnie des Messageries Aériennes, L. Breguet, 2, Rue Galilée, Paris.

Compagnie Générale Transaérienne, M. Amand, 28, Avenue Carnot, Paris.

Compagnie Aérienne Française, M. Ballyguier, 89, Rue Cambon, Paris.

Syndicat du Réseau Aérienne Transafricain, MM. de Valitch and Cohen, 126, Rue de Provence, Paris.

Compagnie des Transports Aériens en Guyane, M. Dutertre, 6, Rue de Hanovre, Paris.

Compagnie des Grands Express Aériens, M. T. Villiers, 3, Rue d'Anjou, Paris.

Compagnie de Navigation Aérienne, M. Latecoère, 182, Boulevard Haussmann, Paris.

Société des Transports Aéronautiques du Sud-Ouest, M. Gindner, 24, Rue Grange-Batelière, Paris.

The Salon de l'Aeronautique.

A Handley Page aeroplane is to be exhibited at the Sixth International Aircraft Exhibition which will open at the Grand Palais, Paris, on Dec. 19th.

A Paris-Metz Air Service.

The Italian correspondent of THE AEROPLANE writes :—

In the course of a speech recently pronounced at Rome, Col. Piccio, Aviation Attaché at Paris, stated that last June he carried out a 500-kilometre flight three times weekly between Paris and the Rhine Provinces (Metz). The trip took three hours, and was continued regularly for the whole month without any let or hindrance, the route flown over being Paris, Chalons, Metz, and the Rhine, leaving Orly

MINISTRY OF MUNITIONS.

BESSONEAU HANGARS.

A quantity of the above are available in different parts of the country. These Hangars are constructed with an exceptionally strong wooden frame-work, easily and quickly erected. No foundation is required and they are covered with strong weatherproof canvas, and besides being suitable for aircraft would be also suitable as temporary buildings.

A typical size of Hangar is **60 ft. by 60 ft. by 13 ft. high.**

The locality, together with any further information required, may be obtained from the—
CONTROLLER, AIRCRAFT DISPOSAL DEPARTMENT, WELCOME CLUB, EARL'S COURT, (nearest Station—West Kensington District).

Telephone—Western 4950. Telegrams—Clearhouse, Aerosupply, London.

IMPORTANT.—Note change of address from York House, Kingsway, to Earl's Court, as above.

NOTE.—For further particulars of other Government Property for sale see "SURPLUS" price 3d., at bookstalls, or by quarterly subscriptions of 2s. post free, payable in advance to the Director of Publicity, Ministry of Munitions, Whitehall Place, London, S.W 1.

FOR SALE.

WYE AERODROME,

KENT.

Area: About 86¾ Acres.

For disposal as a whole, or the buildings and the land on which they stand, without the Aerodrome itself.

The BUILDINGS are of CORRUGATED IRON, BRICK and WOOD; the Flight Sheds Corrugated Iron with wood frames, tarmac floor, concrete foundations. Electric Light Plant, Water Supply including Storage Tank. Permanent tarmac roads. Asphalte Paths.

In addition to its use as an
AERODROME,
the Buildings are suitable for
FACTORY, SANATORIUM,
STORAGE, TRAINING INSTITUTION,
and many other similar purposes.

The site is occupied by the Government under the Defence of the Realm Regulations and can, if necessary, be acquired under and subject to the provisions of the Defence of the Realm (Acquisition of Land) Act, 1916.

For further particulars, apply to Disposal Board D.B.1.a 3, Room 135, Charing Cross Buildings, Villiers Street, London W.C.2.

NOTE.—For particulars of other Government Property for sale, see "SURPLUS," price 3d. at all Bookstalls; or by quarterly subscription of 2/- post free, payable in advance to the Director of Publicity, Ministry of Munitions, Whitehall Place, London. S.W.1.

G. R.

MINISTRY OF MUNITIONS.

(Huts and Building Materials Section).

For Sale by Tender.

KITE BALLOON SHEDS AND COVERS.

Tenders are invited for the following

At No. 16, Kite Balloon Base, Menefield, near Plymouth.

6 Kite Balloon Sheds and Covers,
96 ft. by 36 ft. by 35 ft.
Wooden Frame, Canvas Covers.

Tender Forms, permits to view, and full particulars may be obtained on application to the AREA DISPOSAL OFFICER, 27, High Street, Salisbury. Telegrams:—Hutments, Salisbury.

NOTE.—For particulars of other Government Property for sale, see "SURPLUS," price 3d., at all bookstalls, or by quarterly subscription of 2s. post free, payable in advance to the Director of Publicity, Ministry of Munitions, Whitehall Place, London, S.W.1.

on Monday, Wednesday, and Friday, returning on the alternate days. Radio-telegraphic and meteorological stations ensured the safety of the service, which was thus highly successful.—T. S. H.

FLOWER TRANSPORT.

The Danish correspondent of THE AEROPLANE writes :—

On Nov. 6th a French aerial transport service of flowers is to be started to Denmark, as a Copenhagen firm has contracted with Breguet to have the Paris-Casablanca pilot, M. Roget, to fly, accompanied by a mechanic, with one intermediate landing in Holland, to the Danish capital in one day. Halt a ton of Nizza flowers will be carried for a payment of 12,000 frs., which includes the right of a return load of 200 kg. or two passengers.

It should be possible to sell flowers sent in this way more cheaply than home-grown roses and gilli-flowers. If successful, this aerial flower service will be established as a regular feature.

MANAGERS OF AERO-STATIONS.

Certain aviators in France are demanding that the following qualifications shall be possessed by all entering for the examination which is to be held for the selection of managers for the new series of aero-stations now being laid out throughout France :—(1) To have been pilot; (2) to have passed a stated period at the front or in hospital owing to wounds received in action; and (3) to have been decorated or mentioned in dispatches.

THE PARIS-MELBOURNE FLIGHT.

M. Poulet is now at Avlona, where he has been detained by the bad weather.

GERMANY.

The Danish correspondent of THE AEROPLANE writes :—

A NEW AIR TRAFFIC COMPANY.

The negotiations for months *re* the formation of a commercial aviation enterprise in Bavaria have now taken the final form of "The Bavarian Air Traffic Co., Ltd.," with a capital of 500,000 marks (£25,000 normal value), by the co-operation of the following firms : Bavarian Rumpler Works in Augsburg, Bavarian Air Lloyd, Bavarian Aircraft Works, Bavarian Motor Works and Gotha Aircraft Works. The new concern will carry out no direct service. This will be carried out by the above-mentioned companies. The Air Traffic Co. will limit its activities to organising development of the enterprise, to propaganda, daily and technical work, besides co-operation with other concerns.

The Bavarian Government will not participate directly in the new enterprise, but has supported it by granting it the exclusive concession rights for aerial business transport of passengers and mail and for photography work within Bavaria. For this work a "Bavarian Photo Co., Ltd.," has been formed chiefly by the co-operation of the photographic industry.

The Army authorities are to sell aeroplanes, aerodromes, with works and equipment, to the concern on favourable conditions. The passenger fares have not been fixed so far, but 10 pfennings (1½d.) is to be paid for letters beyond the ordinary stamp, and a dispatch fee is to be paid extra if express service is asked for. The price for paper-sending has not been settled yet, but is likely to be fixed at 10 marks (10s.) per kilo.

ANOTHER NEW COMPANY.

A "Southern Germany Aerial Navigation Co." for Württemberg and Baden is under preparation, to be formed mainly by the Zeppelin concern and the Daimler Motor Works. A close co-operation of the "Southern Germany Aerial Navigation Co." and "The Bavarian Air Traffic Co., Ltd.," is being arranged. Their main task will be to bring out first the true commercial aeroplane; for, as German military aircraft is a thing of the past, the outlook is for going ahead at commercial aviation, as German papers express in their comments when saying : "It is no secrecy that the successful military aeroplane cannot straightaway be employed as a commercial aircraft."

A NEW ZEPPELIN.

Words to the following effect are contained in a note in the German aero-paper "Illustrierte Flug-Welt" : "The Zeppelin concern has completed a giant airship for oversea voyages of the dimensions of a war cruiser."

THE ANTICS OF THE "BODENSEE."

The very favourable results of the first month's service of the airship "Bodensee" are now available, as she has between Aug. 24th and Sept. 23rd carried 1,300 persons in 30 voyages of 208 hours' duration, thereby covering a distance of 20,006 kilometres without any incidence (incidents ?).—HI.

The Bodensee on a voyage from Friedrichshafen arrived at the aerodrome near Berlin at 6.30 p.m. on Nov. 2nd. About thirty persons were in the airship. The wind was very strong. No order was given for landing the vessel, and the crowd who were holding the landing ropes appeared to be the friends of the passengers in the airship, with the exception of some half-dozen officials.

The Bodensee nose-dived five times, and bumped the ground three. One of the people on the ground was killed and five were injured. The Zeppelin then ascended, the lights went out and she vanished. When the airship was being held down the passengers were able to speak to their friends on the ground. One lady was heard to tell her husband that they had had a very bad voyage, and that she would never undertake it again.

The Hamburg-Amerika Line afterwards issued the information that the vessel was safe, and came down in the Harz Mountains. All the passengers were saved. The ship was not seriously damaged, and will return under its own power.

GREECE.

A Handley Page machine, piloted by Capt. W. Shakespeare, arrived at Athens on Oct. 30th after a journey by stages from London. The machine is visiting Greece for the Aviation Exhibition in Athens.

Bad weather delayed the progress of the machine, and during its flight down the Italian coast from Pisa to Rome it encountered a severe wind-storm which threatened to divert its course over the Mediterranean. The stages of the journey were London-Paris-Lyons-Gulf of Genoa-Pisa-Rome-Benevento-Taranto-Athens.

HOLLAND.

AT THE E.L.T.A. AERODROME.

Capt. Hinchcliffe and Mr. Shanks are still over in Holland with their Avros, but the weather has been too bad of late to permit of much flying. In the intervals Capt. Hinchcliffe finds occupation and amusement in negotiations with the Customs authorities over the valuation of material.

They are still using the E.L.T.A. Aerodrome, which is now a most deserted place, overshadowed by the presence of Herr Fokker, who has purchased all the exhibition buildings and the fencing surrounding the aerodrome. The rivalry of commercial aeroplanes seems to be no less keen than were the contests of the war.

A four-engined Handley Page aeroplane, which had been exhibited at the E.L.T.A., flew from Soesterberg, Amsterdam, to Hounslow on Oct. 30th in 2½ hours.

SWITZERLAND.

On Oct. 19th about 3,000 people assembled at Echallens, not far from Lausanne, for a flying meeting. Mr. Bradley, chief pilot of the Ecole Aero, flew over on his Avro at 2.30 p.m., and before landing gave a performance of trick flying, ending in three successive loops. Passengers were then taken up, among them many ladies and several people of note in the place. All were delighted with the machine and the pilot. The Avro was kept busy for 3½ hours, and when the meeting was over a passenger booked a seat for the flight back to Lausanne.

On the following Sunday a meeting was held at Geneva on the football ground, from which one of the goals was removed to make landing space. The ground does not seem to have been too good, however, as "La Suisse" writes that the "biplan Avro" shaved over the poplars bordering the cliffs of the Arve and pulled up about a dozen metres short of the other goal-posts.

The booking of passenger seats was brisk, and most of the passengers "ont demandé a faire des loopings."

Capt. Bradley made several exhibition and passenger-carrying flights at Nyon on Nov. 2nd. Whilst flying with a passenger he crashed while trying to avoid overhead electric cables. The pilot and passengers were only slightly injured, but the machine was destroyed.

UNITED STATES OF AMERICA.

ANOTHER CROSS-ATLANTIC PRIZE.

A Frenchman, who has resided for many years in New York, has offered a prize of 125,000 francs (nominally £5,000) to the first aviator who flies from New York to France or France to New York. The Aero Club of America is drafting the regulations.

Either a seaplane or aeroplane may be used for the flight which must be made between May 20th, 1919, and May 20th, 1924. The entrants must be subjects of one of the Allied Powers, and must hold the pilot's certificate of the F.A.I. The entrance fee of £46 must be paid to the Aero Club of America, and should be forwarded with the notice of entry at least 14 days before the entrant intends to attempt the flight. He must also inform the Club of the point from which he intends to start and (approximately) the area in which he proposes to land.

If an aeroplane is used the point of departure must be within 50 miles of Paris or New York. A single machine must be used for the flight.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

A first instalment of an article describing the products of the Marine Aircraft Experimental Depôt at the Isle of Grain appears in this number.

This article and the accompanying illustrations are published by permission of the Director of Research, the Air Ministry, who has placed a large number of the photographs at the disposal of THE AEROPLANE for this purpose.

The work carried out at this establishment has never been widely advertised and is generally little known, but, as this article indicates, a large amount of useful experimental work was carried out, and some very original machines were produced there during the war.

A brief history, profusely illustrated, of the German seaplanes designed and built by the Friedrichshafen Flugzeugbau during the late war will be found on page 1609 *et seq.* German seaplanes are of even greater interest than are German land machines, if only because very little was actually seen of them during the war, and the number of captured specimens—in any recognisable state—was almost nil.

The Martinsyde two-seater machine which is to attempt the Australian flight is illustrated and described on page 1596.

A note on the Italian-built semi-rigid airship bought by the British Admiralty appears in this issue.

THE WORK OF THE MARINE EXPERIMENTAL AIRCRAFT DEPOT, ISLE OF GRAIN.

By Capt. W. H. SAYERS, Late R.A.F.

At the outbreak of war the Isle of Grain Air Station was one of the largest of the seaplane stations of the Royal Naval Air Service. During the first six months or so of hostilities it was regarded as an important war station, and in addition to seaplane patrols it provided a reception depôt for seaplanes, and a fitting-out establishment for the earlier seaplane-carrier ships. Its proximity to Sheerness Dockyard and to Short Bros.' works at Eastchurch and Rochester—then practically the only source of seaplane supplies—particularly fitted it for that purpose

Grain Repair Depot.

Even before August, 1914, it had been decided to make Grain Island something more than merely a seaplane station, and it was intended to establish there the Royal Naval Air Service Repair Depôt. This project survived the beginnings of war, and what had been early in 1914 the Salvation Army Congress Hall in Kingsway, purchased by the R.N.A.S. during that summer, was re-erected at Grain some hundred yards from the Air Station proper, and equipped with tools, power plant, and drawing-office. It was commissioned under Squadron Commander G. W. S. Aldwell, R.N., as the R.N. Aeroplane Repair Depôt early in 1915, as an entirely separate command. The Port Victoria Station Hotel was commandeered and converted into quarters for the men, and the Royal Corinthian Yacht Club-house was used as the officers' mess. This establishment became known as Port Victoria to distinguish it from the adjacent Air Station.

Although the establishment continued to be known as the Repair Depôt for some considerable time, very little repair work was carried out there. For a short time in its early history it was nicknamed the Royal Naval Tail Plane Factory, because for some months its only productions were a series of new tail units for various machines which had been found in service to be insufficiently stable.

A notable incident of this phase of its career was the evolution from the Sopwith "Schneider" of the "Baby" seaplane, involving the abolition of warping wings and the substitution of ailerons, the fitting of an entirely new tail unit of considerably greater area, and some modification to the floats.

Thus Port Victoria Repair Depôt was gradually diverted from its proposed functions and turned into a purely experimental workshop.

The Experimental Armament Department.

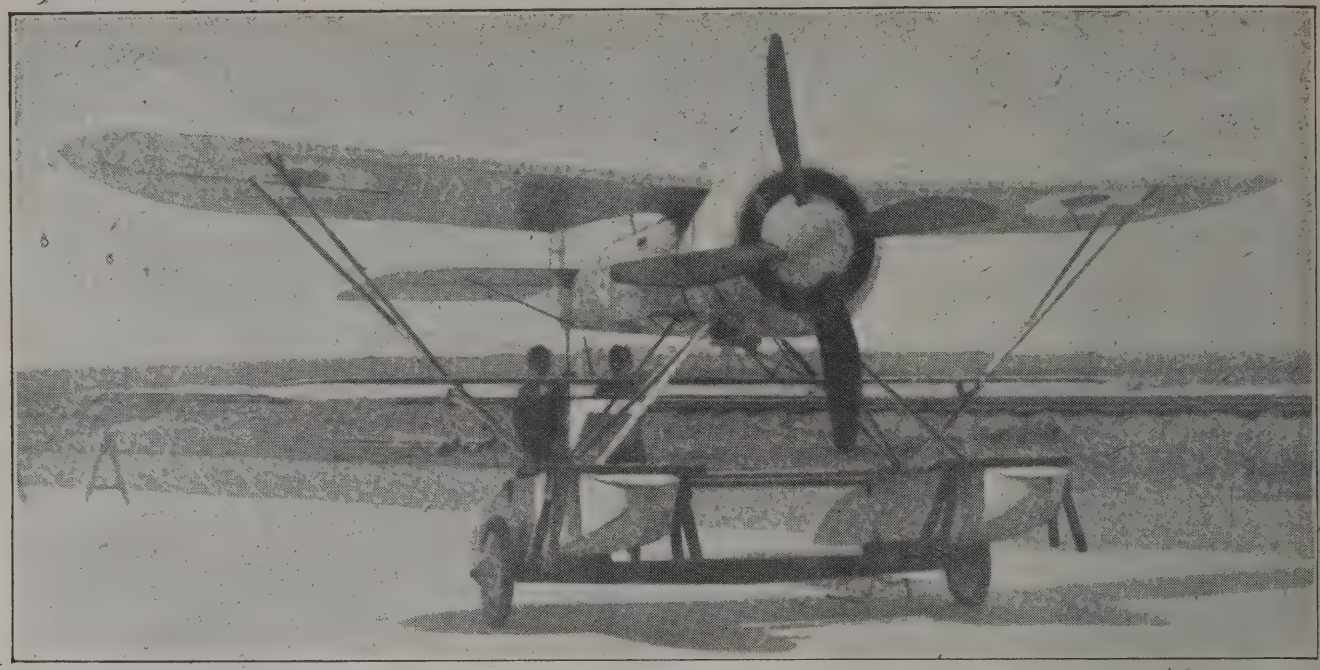
During the latter part of 1915 a second shed at Port Victoria intended as an extension to the Repair Depôt was erected, but it was annexed by an Armament Experimental Department for their workshops.

This department, although it was in many ways more akin to the Repair Depôt than to a war station, was placed under the command of the Grain Air Station, with Lieut.-Commander Robertson as the head of the department.

The Test Flight.

At a date early in 1916 the third of the Grain experimental sections had its origin in the shape of one single Flight Sub-Lieutenant, attached to Port Victoria for discipline, but under the orders of K Section, Air Department. This officer—one F. E. Sandford, now Squadron Leader in charge of what was then Port Victoria—constituted the Seaplane Test Flight.

At the end of 1916 Wing Commander Aldwell was transferred to the command of the Dunkirk Repair Depôt, Grain Repair Depôt was placed for discipline under Grain Air Station, with Squadron Commander H. M. Cave-Brown-Cave as O.C. Repair Depôt. By this time Port Victoria had grown to three large sheds, the original shed being now machine and fitting shop only, a further shed served as an erecting shop, and the third was a running shed with one aisle partitioned off as a drawing-office.



The Test Flight became a separate department under Squadron Commander Travers, and had been allocated sheds at the Air Station—now declining in importance as a war station—and Grain as a whole became practically a seaplane experimental station and acceptance depôt under the command of Wing Commander (Major, R.M.L.I.) C. E. Risk.

At this date the R.N.A.S. possessed a test flight for land machines at Eastchurch, with Squadron Commander H. R. Busteed in command.

On the formation of the Air Board it was decided that all future land machines should be tested at Martlesham, and Commander Busteed was transferred to Grain, succeeding Commander Cave-Brown-Cave at the Experimental Construction Depôt, as Port Victoria was now officially named.

Grain had now become the Naval Aircraft Experimental Depôt, uniting under a single command Experimental Construction Depôt, Seaplane Test Depôt, and Experimental Armament Section. In addition it was used to some extent as a seaplane acceptance depôt.

Wing Commander Risk was succeeded in the command of Grain by Wing Commander L'Estrange Malone, Wing Commander E. F. Briggs, and finally by Wing Commander Busteed. Squadron Commander Robertson was raised to Wing Commander and translated to the Bolo House, and was succeeded at the Experimental Armament Depot by Lieut.-Commander Chalmers, R.N.V.R., who held the position, as Major, R.A.F., till after the conclusion of hostilities.

P.V.2 (100 h.p. Mono Gnôme engine), the first machine completely designed and constructed at Grain in her original form.

Squadron Commander Travers also received merited promotion and was translated to the Technical Department, being succeeded in the command of Test Depôt by Squadron Commander (later Major) M. E. A. Wright, and on Col. Busteed's accession to the whole command, the original test flight pilot at Grain, then become Major F. E. Sandford, succeeded as the officer commanding the Experimental Construction Depôt. Since the armistice other changes have occurred, but the above outline serves to indicate the general history of the establishment during the war.

Of the three main departments into which the Station was divided, the work of the Experimental Construction Depôt (known as E.C.D.) is probably the most generally interesting.

A good deal of the work done by the Armament Depôt was extremely important, dangerous, and at times amusing, but the nature of its work cannot here be described in detail for obvious reasons.

Except in very general terms the present writer is unable to do justice to the experimental work of the technical officers of the Test Depôt, but it is hoped that a description of some of their trials in the work of devising methods of measuring aeroplane performance will one day be forthcoming.

Experimental Machines Built by E.C.D.

The most important step in the diversion of the Port Victoria Repair Depôt from its original purpose was due to the initiative of Squadron Commander J. Seddon, R.N., as he then was, of K Section, Air Department, Admiralty. The habit, persistent for long after, of attempting to fly Sopwith "Baby" seaplanes with two 65-lb. bombs attached to them was then in its infancy, but Commander Seddon had even then realised that the "Baby" was not really up to the work. What was really needed was a seaplane of about the same overall dimensions as the "Baby" which, carrying the bomb load, should possess a getting-off and landing speed no higher than that of the "Baby" and a considerably greater ceiling.

P.V.1.

A study of certain N.P.L. wing tests convinced him that a wing section might be developed giving much higher lifts than those usually employed, and that with such a wing the desired machine might be produced by some sacrifice of top speed.

The matter was referred to Port Victoria and it was decided, early in 1916, to experiment by converting a Sopwith "Baby" and fitting it with high lift wings.

The result of this experiment was a curious machine known as P.V.1, which consisted of a Sopwith "Baby" fuselage and chassis, equipped with a pair of heavily cambered wings of the same total surface as the original wings, but of greater aspect ratio and with a fair stagger, and a pair of enlarged floats.

As it was desired to carry out the trials in the shortest possible time, and as the machine was meant purely as a wing test and not as a war machine, no attempt was made to save weight in the structure. The old wing root spars in the fuselage were sawn off flush and their remains left *in situ*, the wings were put on where they gave the pilot the best view, and the machine's centre of gravity was adjusted to the new wings by putting lead into the floats.

Thus when complete the weight was nearly 300 lb. more than that of the "Baby," and yet with an additional 300 lb. of lead as load P.V.1 with 100-h.p. got off and landed at 35 knots and took her 600 lb. total of added weight to over 8,000 ft. and was entirely free from "sogginess."

True the top speed was only 67 knots—but that was little worse than had been hoped for, and rather better than was feared. The minimum speed and climb were, however, at least as good as had been expected.

This machine was kept at Port Victoria for some time and was used for experimental purposes. Amongst other trials she was once taken off a truck on the Grain railway siding in the course of some of the earliest tests connected with the problem of catapult gears for shooting machines off ships' decks. Eventually she was sent to Calshot as a preliminary training machine for "Baby" seaplane pilots.

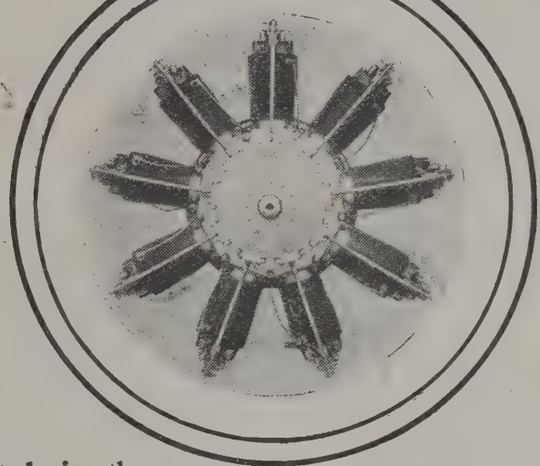
Early Deck Landing Trials.

At about the same date the Repair Depôt began experimental work on deck landing devices. The first of these—an inclined wire-rope way to be fitted over the stern of the ship—was tried and a B.E. fitted with a special chassis was actually landed thereon. This idea was dropped in favour of sandbags attached to ropes stretched across the landing deck and an attachment to the machine which picked up successive ropes during the process of pulling up. This line of experiment went as far as the manufacture of all the fittings for test on a standard Avro, but was then dropped for nearly eighteen months, and later developments of this line of work will be dealt with in future instalments.

P.V.2.

The idea of designing a bomb-carrying seaplane of the "Baby" type at Grain was abandoned in the belief that the "Hamble Baby" would supply the need, and Grain was instructed, at the instance of Commander Seddon, to design a small, fast seaplane for Zepp.-strafing. The special features of this machine was to be its armament—one two-pounder Davis gun, which had to be carried over the upper plane, to be clear of all wing bracing, and yet accessible to the pilot for loading. A low landing speed—not more than 40 knots—the ability to reach and cruise at 10,000 ft., and a high speed of approximately 80 knots were asked for, with three hours' fuel, 10 rounds of ammunition, and a 100-h.p. Mono. Gnôme engine.

Commander Seddon suggested that a monoplane with the P.V. high-lift wing would meet the case, and actually the machine designed was almost a monoplane. The upper wing sprung from the top rail of the fuselage, with a lower plane of much smaller span and chord beneath the fuselage, carried therefrom by short centre section struts. The wing bracing consisted of a steel tube strut from the float chassis to the lower wing, and thence two struts to front and rear spars on the upper wing on each side.



The lower wing was really used more as a stiffener for the main bracing struts than as a lifting surface.

Ailerons, which washed out from the normal wing camber at their inner ends to a pronounced reflex curve at the tips, were fitted to the upper wing only.

POWER

—an outstanding point in "the most efficient Aero Engine in the world"

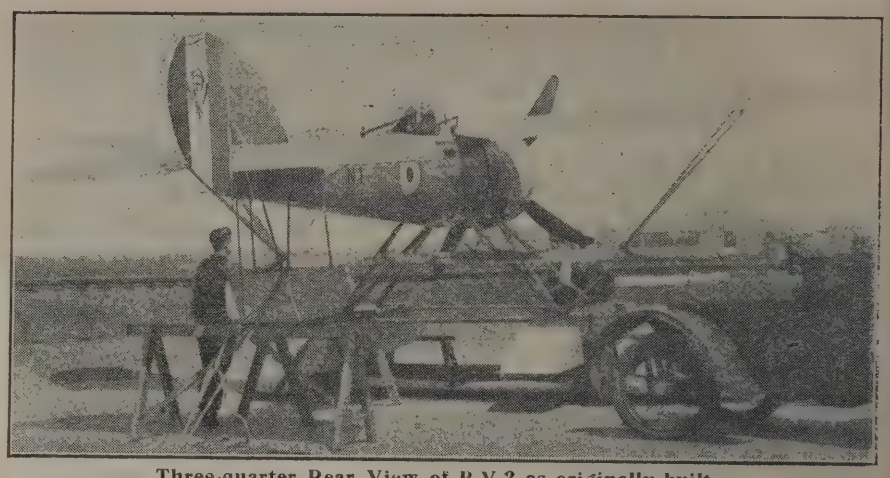
The Engine illustrated is the DRAGONFLY—340 h.p.—9 cyl. (Static Radial).

WALTON MOTORS, Ltd.
Walton-on-Thames.

Telephone:
ESHER 306 and 307.

Telegrams:
"MOTORS, WALTON-ON-THAMES."



There were neither flying, landing, nor incidence wires in the structure, the wing lift being transmitted *via* the s... tubes to the chassis and thence to the fuselage.

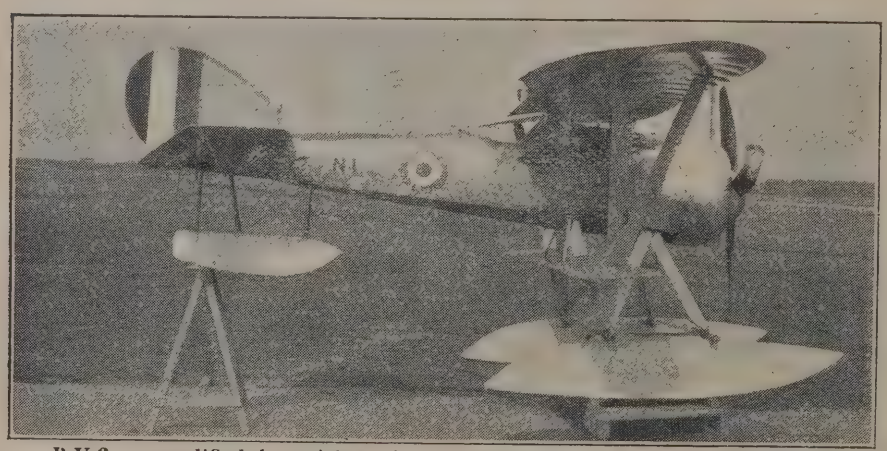
The fuselage was of the usual wire-braced type, carrying a 100-h.p. Mono Gnôme at its front end, and faired out to a circular section which gradually washed out aft the wings.

The pilot's seat was just behind the upper rear spar, and was fitted with t usual "joystick" control, instrument board, etc.

Apart from the wing structure the machine was of conventional design, and illustrations are given which show the general arrangement.

Particular attention was paid to reducing head-resistance throughout, and a method of fairing circular tube struts by enclosing them in three-ply sheaths, steamed and die-pressed to form a single-piece fairing, was developed for this machine.

Three-quarter Rear View of P.V.2 as originally built.



The machine was flown for the first time in June, 1916, giving promising results, but suffered from defective lateral control traced to the very long ailerons which extended nearly to the body, flexing when they were operated.

These were reduced to half their length and stiffened, which effected a complete cure.

Seaplane testing in these days was in its infancy, and the reported high speed of 83 knots was probably too high. Nevertheless the machine flew uncommonly well, and its landing speed, which certainly did not exceed the 38 knots given, was remarkable considering the loading of 9.5 lb. per sq. ft. This machine (N.1) was known as P.V.2, and was of the dimensions given in the attached specification :—

SPECIFICATION.

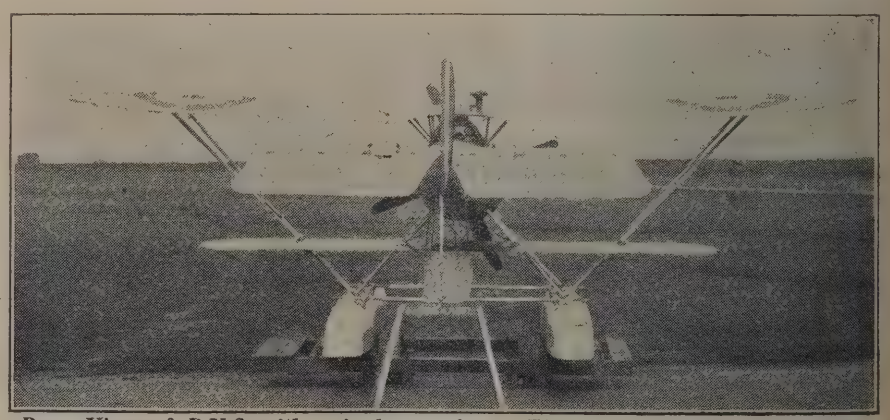
Type of machine	Seaplane scout.
Name or type number of machine	P.V.2 (original).
Purpose for which intended	Zeppelin-strafing.

P.V.2 as modified by raising the top plane to improve the Pilot's view.

Span	top, 27 ft.; bottom, 19 ft.
Gap	3 ft. 6 in.
Overall length	22 ft.
Maximum height	8 ft. 4 in.
Chord	top, 5 ft. 6 in.; bottom, 2 ft. 6 in.
Total surface of wings	168 sq. ft.
Engine type and h.p.	Mono Gnôme 100 h.p.
Weight of machine empty	1,087 lb.
Disposable load apart from fuel	200 lb.
Total weight of machine loaded	1,590 lb.
Load per sq. ft.	9.5 lb.
Weight per h.p.	15.9 lb.
Tank capacity in gallons	petrol, 30; oil, 9.
PERFORMANCE—	
Speed low down	*72 knots.
Landing speed	38 knots.
Climb—	
To 3,000 ft.	5 min.

A MODIFICATION.

By the time the machine was ready, however, the Davis gun had relapsed from favour—to reappear later on it is true, but not in this story. It was therefore decided to fit two Lewis guns on the wings and make a fighter seaplane of it. However, test pilots complained of the blanketing by the upper plane before them of the view when alighting, and the machine was therefore modified by raising the upper wing 1 ft. to the level of the pilot's eyes, and inserting a centre section of such a span as would keep the inter-wing struts in their original line. This alteration was greatly delayed by other work, but eventually the modified machine was tested in early 1917 and was greatly liked by those who flew it.



SPECIFICATION.

Type of machine	Seaplane scout.
Name or type number of machine	P.V.2 (bis.).
Purpose for which intended	Fighting.
Span	top, 29 ft.; bottom, 19 ft.
Gap	4 ft. 6 in.
Overall length	22 ft.
Maximum height	9 ft. 4 in.
Chord	top, 5 ft. 6 in.; bottom, 2 ft. 9 in.
Total surface of wings	180 sq. ft.
Engine type and h.p.	Mono Gnôme, 100 h.p.
Weight of machine empty	1,211 lb.
Disposable load apart from fuel	192 lb.
Total weight of machine loaded	1,702 lb.
Load per sq. ft.	9.5 lb.
Weight per h.p.	17 lb.
Tank capacity in gallons	petrol, 30; oil, 9.
PERFORMANCE—	
Speed low down	*72 knots.
Landing speed	38 knots.
Climb—	
To 3,000 ft.	6 min.
To 10,000 ft.	*35 min. 36 sec.

* Official test report figures. Actually realised a speed of 81 knots and a considerably better climb on later tests.

THE P.V.4.

Early in 1916 the Armament Section asked Port Victoria if they could design a two-seater fighter in which a gun could really be used. Sketch designs of a two-seat pusher

Rear View of P.V.2 with raised top plane. This view gives an excellent idea of the wing-bracing.

The Success of the R.34.

Extract from General Maitland's Log:

MIDNIGHT—

"*As we lay in our hammocks we listened to the rain beating pitilessly down on the outer cover of our trusty ship of the air, and our feelings, despite the weather, are those of complete confidence and security.*"

The success of this history-making trans-Atlantic flight and of the subsequent long distance voyages under adverse weather conditions, was largely contributed to by the fact that her cover was finally doped by our **SCHEME H.2.** which was applied

ON THE TOP

of the ordinary dope, thus rendering the cover weather-proof and water repellant.

SPECIAL DOPE H.2

is manufactured entirely by

THE BRITISH CELLULOSE & CHEMICAL MFG. CO., LTD.

the largest manufacturers of Cellulose in the World, and has been supplied exclusively by them to the British Government for the final doping of the outer cover of

R.32, R.33, R.34.

Half Side View of P.V.4 (110 h.p. Clerget). Note the Linton Hope Floats.

land machine with the 110 Le Rhône were prepared, and after some discussion were developed in detail. These designs never materialised—in that form—for they attracted the attention of certain higher authorities, who demanded a seaplane of somewhat similar arrangement for reconnaissance work, to carry wireless, a Lewis gun, and eight hours' fuel. An engine, known as the Smith "Static" radial, weighing 380 lb. and giving a guaranteed h.p. of 150 on a very low fuel and oil consumption, was promised for this purpose.

On the engine's promised performance it was estimated that the required load could just be carried within the limits of performance specified—40-80 knots and 5,000 ft. in 15 min.—and the machine known as P.V.4 was put in hand.

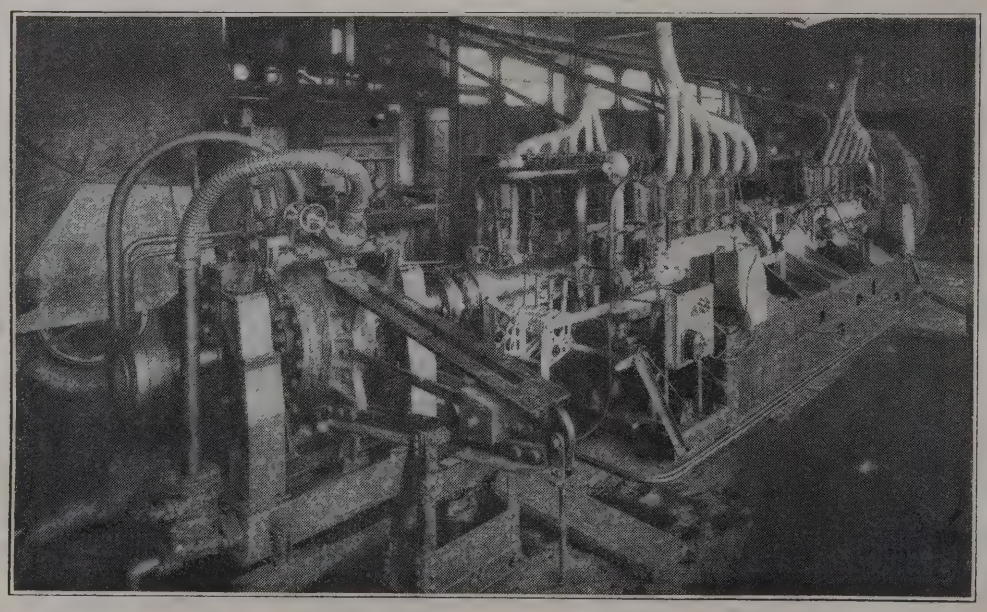
The number P.V.3 had been allotted to an Admiralty design which actually was built elsewhere, and the number remains unoccupied.

The whole structure of the machine was manufactured by the autumn of that year, but the promised engine never materialised. In the middle of 1917 the machine was put together with a 110 h.p. Clerget engine, the installation whereof led to a number of complications due to the extremely compact general arrangement of the machine and the much greater overall length of the Clerget engine, whose carburetter was in the midst of what should have been fuel tanks and whose airscrew hub was nearly a foot further aft than that of the intended engine.

As eventually put together for trial purposes the machine weighed 2,400 lb. with pilot, passenger, Lewis gun, and four hours' fuel. The span was 32 ft. and the total surface 220 sq. ft., and with a loading of nearly 11 lb. per sq. ft. and 22 lb. per h.p. the machine showed a top speed of about 70 knots and possessed a discernible climb—not a discreditable showing under the circumstances.

One very serious defect in the machine was due to the very close proximity of the airscrew to the tail plane, which, coupled with the change in the position of the centre of gravity, caused by the change of engines, made it impossible to balance the machine both with engine on and engine off. With a tail setting giving correct balance in the full blast of the propeller, the machine was tail-heavy with the engine off, and lost all longitudinal control below about 55 knots.

This could very easily have been remedied by redesign of the tail plane, but the machine was not thought of sufficient importance for this alteration to be made.



This characteristic led to her alightings being quite picturesque affairs, and incidentally afforded an excellent strength test of the experimental Linton Hope type floats with which she was fitted.

Though the type has never been perpetuated, it represents one of the most satisfactory general arrangements for a fighting and reconnaissance machine which has ever flown. Both seats are ahead of the wings, and the upper plane is on the nacelle top rails. The observer has an absolutely clear view over the whole hemisphere ahead and over a complete quarter-sphere to the rear above the wing level, and could use a gun freely over the whole range of vision. Given a reasonable weight per horse-power—*i.e.*, a modern power plant—and a very high performance could be obtained from the type.

(To be continued.)

Three-quarter Front View of P.V.4. This gives an idea of the excellent view and field of fire from the front seat.

THE POWER UNIT OF THE LINKE-HOFFMANN BIPLANE.

The accompanying photograph represents the four 260 h.p. Mercédès engines, which form the power plant of the Linke-Hoffmann R.2 "Giant" aeroplane (described in THE AEROPLANE of July 30th, 1919)—together with the airscrew drive gear—assembled on the test bench. Particularly interesting is the brake to which the plant is coupled—a Heenan and Froude hydraulic dynamometer of British manufacture.

WESTLAND

The Westland "LIMOUSINE"

with the "Rolls-Royce" engine. This is not a converted war machine, but has been designed and built for high-class public passenger service or for the convenience of the private owner.

During the strike a Westland "Limousine" was taken over by the Air Ministry for carrying H.M. Mails. In that week the machine flew nearly 1,000 miles without the slightest defect appearing. A great part of this distance was covered in very bad weather, testing the air worthy qualities of the machine to the utmost.

It combines the speed of an aeroplane with the comfort of a Limousine.

For full particulars and arrangements as to trial flights apply to our London Representative, **Lieut.-Colonel C. H. MEARES,** c/o MESSRS. PETTERS, LIMITED, 6, DEAN'S YARD, WESTMINSTER, LONDON, S.W.1.

THE AUSTRALIAN MARTINSYDE.

The Martinsyde A.S. Machine (275 h.p. "Falcon" Rolls-Royce engine) for the Australian flight.

The machine in which Capt. Howell will make his attempt to fly to Australia is, with a few exceptions, the standard Martinsyde type "A.1" especially designed for commercial purposes. The Australian machine has a slightly larger tank capacity than the standard, enabling it to remain in the air over 10 hours. The fitting of these tanks has not involved any structural alterations. The machine is a biplane fitted with a single Rolls-Royce Falcon III engine of 275 h.p. Its main dimensions are :—

Length overall	27 ft. 5¼ in.
Span (extreme)	43 ft. 4 in.
Chord	6 ft. 6 in.
Gap	5 ft. 6 in.
Tail plane	Adjustable
Area of top planes (all in, including C. section)	272 sq. ft.
Area of bottom planes (all in)	250 sq. ft.

In addition to the extra petrol, spare engine and machine parts, tool kits, etc., weighing about 1,000 lb. are carried.

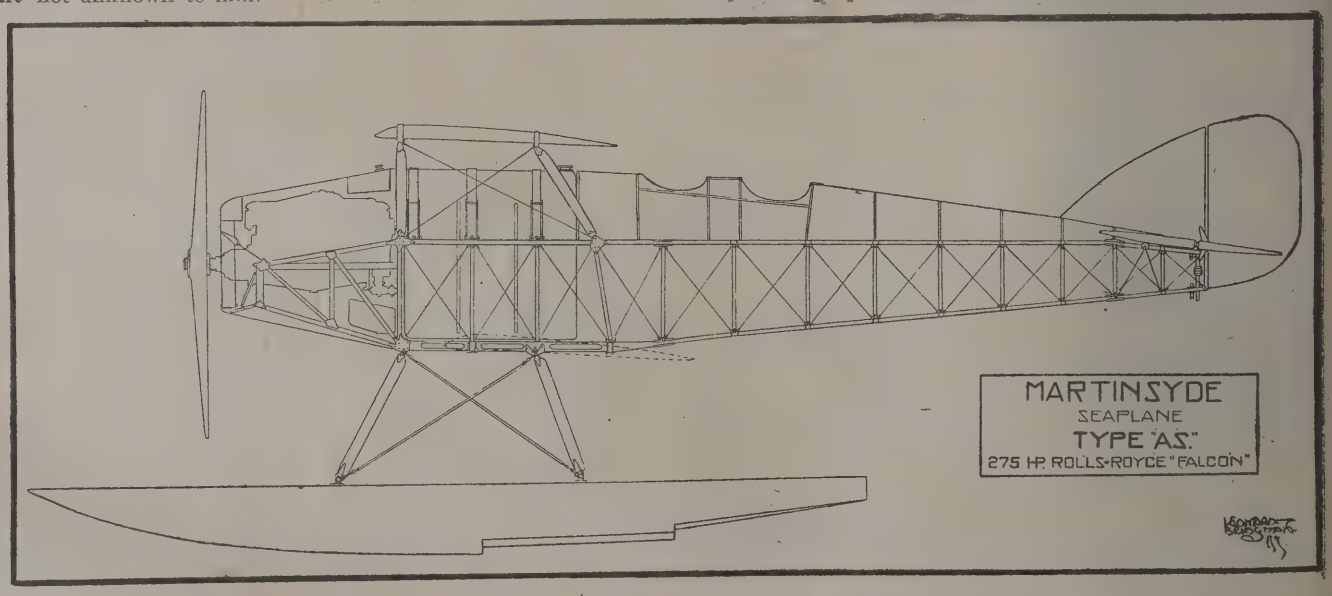
The machine carried this weight very comfortably, and so loaded the most economical cruising speed is the high one of 100 miles per hour. The machine is remarkable in that although it has a very high maximum speed—130 m.p.h. (faster than many fighting scouts in 1918)—it has the very low landing speed of 40 m.p.h , enabling it to land in a very small confined space.

These two factors, high cruising speed and low landing speed, are of tremendous importance in a journey of this kind, the high cruising speed cutting down the flying time between stops, and the low landing speed facilitating landing on the many indifferent aerodromes en route.

Faith is not being pinned entirely to these qualities. Even a helicopter cannot land on mangrove swamps or volcanoes. Capt. Howell has spent some time in the East Indies, and the difficulties which are confirmed by General Borton's report are not unknown to him.

Floats of a special design have been constructed, and with but very little labour the land carriage can be removed and the floats attached. These floats have been tested and dispatched to Calcutta, where the change will be made.

The machine is equally efficient with floats as with a land carriage, and on test it was found to maintain the normal cruising speed. Capt. Howell does not place much reliance in instruments. In the course of some 2,000 hours' flying under various conditions, and on many types ranging from scouts to twin-engined bombers, he has tried out many and various instruments, and is convinced that the minimum number is the best. With the exception of the main compass, which is of special pattern, only standard instruments are fitted. The pilot will take his own navigating instruments.



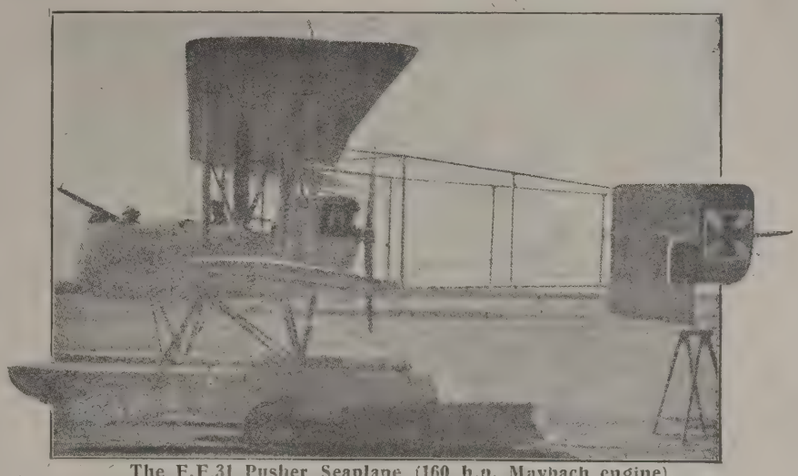
The fuselage of the machine is deep in section and the pilot and mechanic have plenty of protection. As, however, this machine is meant for hard work no attempt has been made to fit cabins as on the "A.1" passenger type.

An airscrew is among the spares carried on the machine, and, with those distributed to the various stopping places, should enable any but the biggest repairs to be accomplished.

AN AERONAUTICAL MOLESWORTH.

The review of Mr. A. W. Judge's "Handbook of Modern Aeronautics" published in The Aeroplane of Oct. 22nd has apparently given the impression in some quarters that the book as a whole is some five years out of date.

The reviewer wishes to put it on record that this applies solely to the sections in regard to which the particular criticism was made, that is to such aerodynamic statistics as the properties of aerofoils as determined by model tests, and to strength calculations and the like, which actually form only a very small proportion of the whole.—W. H. S.



THE GERMAN FRIEDRICHSHAFEN SEAPLANES.

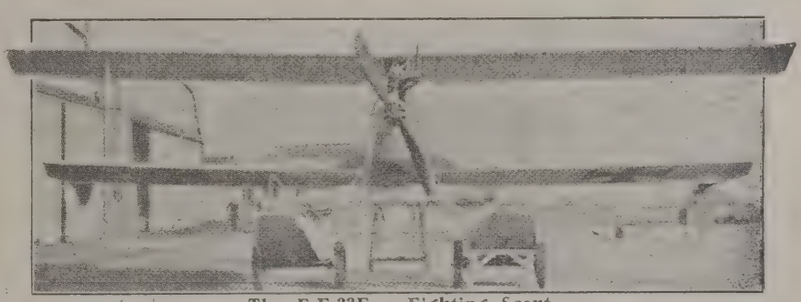
By ERIK HILDESHEIM.

Formed in 1912 as a branch of the Zeppelin Airship Building Co. at Bodensee, the Friedrichshafen Flugzeugbau ("F.F.") was the first German aircraft works devoted solely to seaplanes, and was during the war one of the two chief contractors to the navy, the other one being the Brandenburg Company, the Sablatnig and the Gotha firms coming next.

F.F. seaplanes were built under licence also by the L.F.G., Sablatnig, and Travemünde works. In all, 20 different models were produced—viz., the F.F. Nos. 29, 31, 33, 33B, 33E, 33F, 33H, 33J, 33S, 33L, 34, 35, 39C, 40, 41A, 43, 44, 48, 49C, 64—two of which were pushers, sixteen being ordinary tractors, and two twin-engined seaplanes developed from the Friedrichshafen land model.

The first seaplane, F.F.29, equipped with a 120-h.p. Mercédès motor and intended for bombing, was still of the pre-war type, with the observer in the front cockpit, with a gravity half-hour's flight emergency tank hanging in the cabane, and with the radiator above and

The F.F.31 Pusher Seaplane (160 h.p. Maybach engine).



The F.F.33 Bombing Seaplane (120 h.p. Mercédès engine).

supported from the cylinders. F.F.33 was an identical seaplane except for the floats, which applies again to the 33B version.

In these machines the boat-form bows were abandoned and a stern with flared bottom was adopted. The pilot and observer changed places, and the latter was provided with a gunring, as the seaplanes were used for scouting. The "Hazet" type strip radiator fitted on the side was employed and a 160-h.p. Maybach engine installed.

33E is again very similar to the above-mentioned models, being equipped with a 150-h.p. Benz engine and having a front radiator mounted at the leading edge of the top plane. The floats had by now increased so much in length that during the production of this seaplane the tail float could be abandoned. 33E was provided with wireless and employed either for bombing or scouting, or for both services, and was the first Friedrichshafen aircraft with the characteristic twin tail fin (both above and below the body) and balanced rudder.

33F is again a development of the 33 type with reduced dimensions to improve controllability, and was the first German naval fighting scout. A further improvement was the 33H variation with shortened body and redesigned ailerons and floats, aiming at reduced head resistance. Yet the main change was a new cabane and the provision of load struts between the floats, duplicating the cable wiring so that the gunner could fire between the screw circle and

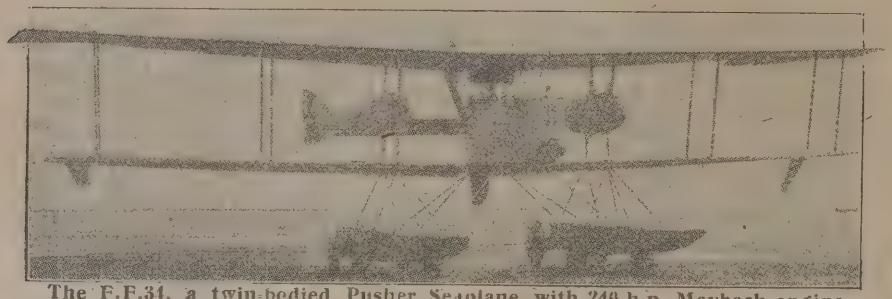
The F.F.33F, a Fighting Scout.

The F.F.8, with 240 h.p. Maybach engine.

the inner set of struts without fearing a breakage if the cable wiring here should be shot through.

The 33J was the direct successor to the 33E, especially seaworthy and equipped with a 150 h.p. Benz motor and wireless for scouting. It was employed on board the raider cruiser "Wolff" and was superseded by 200 h.p. seaplanes from military points of view only, being maintained as the chief German naval training machine, as the model 33S.

For scouting it developed into the type 39C of increased dimensions to suit the new 200 h.p. Benz power plant, the top planes being further provided with an increased stagger.



In time this seaplane was improved as the F.F.49C model of pronounced Hunnish aspect from the efforts of paying high attention to seaworthiness. This type was in service for two years up to the end of the war and satisfied German demands of seaplane performance with a speed of 140 kilometres per hour and a climb to 6,000 ft. in 25 to 30 min., as the seaplane would most often fly at low heights.

It is quoted that this model often rescued and flew with the crews of other seaplanes, and that the crew of a Friedrichshafen 49C patrol seaplane with wireless was rescued after a week's drifting at sea, when all hopes had long been given up.

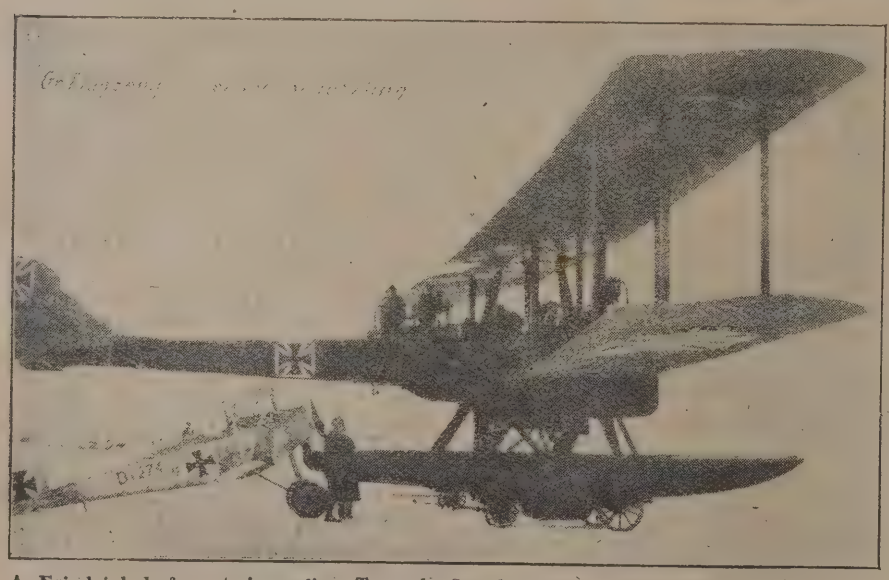
The 49B model was identical but for the adoption of the front observer cockpit with aiming device, as the model was turned out for bomb dropping.

The F.F. Reconnaissance Seaplane, Type F.F.33E. (150 h.p. Benz engine).

The F.F.31, a twin-bodied Pusher Seaplane, with 240 h.p. Maybach engine.

The second seaplane model to be turned out by the Friedrichshafen works was a pusher biplane with 160-h.p. Maybach motor, the F.F.31 model, bearing much resemblance to the Vickers gun-'bus, with its fixed tail fin. Here, too, the gunner-observer with his bombs sat in front, as the model was primarily intended for patrolling. Once again later another pusher biplane was brought out for the same object, being the F.F.34, equipped with a 240-h.p. Maybach engine and wireless, which was of the empty twin-fuselage design made of three-ply wood. An experimental model was the F.F.40, with twin tractor-screw drive by a 240-h.p. Maybach motor, which was satisfactory but for the excessive weight of the transmission gears.

Another experimental Friedrichshafen seaplane was the F.F.44, with single screw driven by the same power plant through a spur-wheel reduction gear.



F.F.33L was a further development of the H version, equipped with a 150-h.p. either Benz or Mercédès motor, and was used for fighting, representing a compromise between performance and seaworthiness.

The F.F.43 was produced as a single-seater fighter, its chief feature being that the eyes of the pilot were level with the main top plane spar to afford a good view above and below the top planes.

The F.F.48 model was turned out as a two-seater fighting seaplane for long flights, fuel being carried for 5½ hours. A 240-h.p. Maybach engine and one fixed and one turnable machine-gun were installed, forward firing of the latter between the screw circle and the inner strut sets being possible.

Twin-engined Seaplane. Model F.F.35 (two 150 h.p. Mercédès engines).

A Friedrichshafen twin-engine Torpedo Seaplane and the captured Nieuport which acted as escort.

The twin 150 h.p. Mercédès-engined F.F.35 model was the first two-motored Friedrichshafen G class seaplane, the engines being mounted in A struts on the lower planes, independent of the interplane strutting. To protect the tail unit well from the sea the fixed plane, as well as rudder and elevator, were raised above the fuselage end, the latter being made of three-plywood with a vee-bottom to act as float support and thus reduce shock stresses on the body in rough sea. Another feature was that in this aircraft all main plane fuselage and float fittings were machined from solid steel forgings.

From the experience of the land-going F.F.G. class bombers the naval authorities ordered special torpedo-carriers, being mainly the F.F.41A model equipped with two 150 h.p. Benz motors mounted in V struts. Experience showed this twin-engined seaplane to be seaworthy.

To provide the scouting seaplanes with better facilities for defence the F.F.59C model was provided with in-

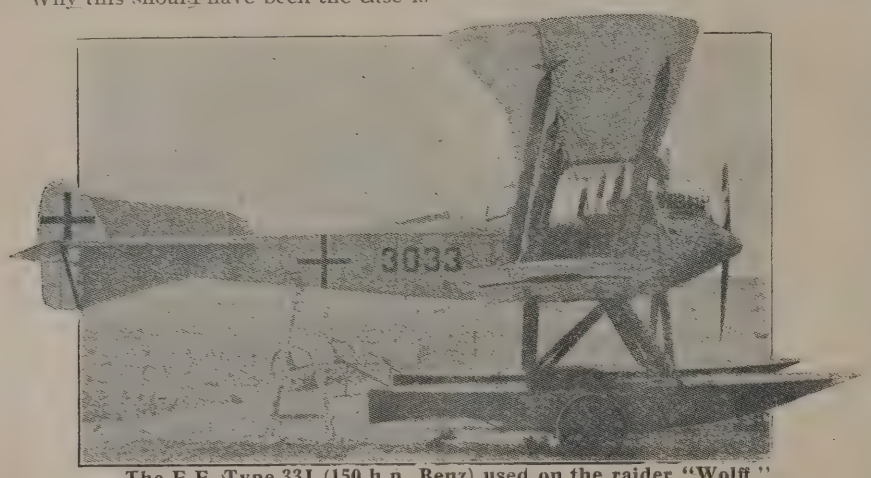
KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

creased interior strut distance, leaving out the wiring for better front firing of the rear gun. The last Friedrichshafen seaplane type during the war, the F.F.64, was designed on the results obtained with the "Wolff" air-raider. This seaplane was equipped with a 160 h.p. Mercédès motor, and for hoisting on board ships and for easy complete dismantling was made to fold its wings.

This record of achievement on the part of a single firm would seem to show—or rather emphatically to confirm what is otherwise known—that the German authorities assessed the seaplane more nearly at its true value than did the British.

The Friedrichshafen seaplanes performed extremely well in service in the North Sea, and were generally reported to be faster than the British seaplanes which were in service against them.



Why this should have been the case is not particularly obvious from the illustrations given herewith, since the machines show no striking features of design.

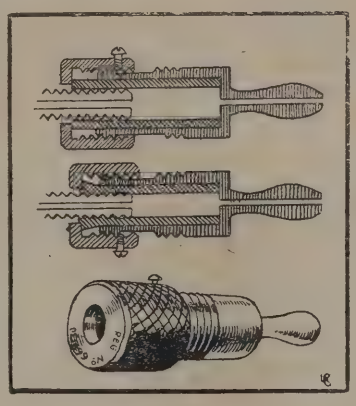
They are generally of clean design, and their floats appear to have been designed with an eye to low resistance, but it seems probable that in the main they owed their advantage over their opponents to the fact that the Germans did not load their seaplanes up with all sorts of gadgets as did the R.N.A.S., but confined them to their designed load, and that the German authorities were as quick as possible in putting improved types into service.

At least the German naval authorities seem to have had a fairly clear idea of what types of machines were required for war purposes, and to have persisted in the development and improvement of machines of those various types—a policy in rather marked contrast to that of their British rivals.

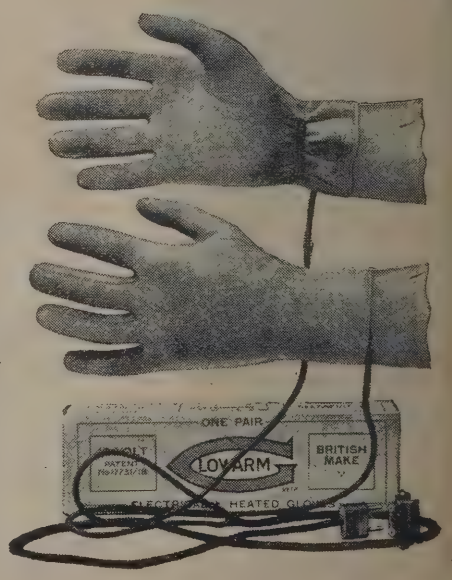
The F.F. Model 41A Torpedo-carrier (two 150 h.p. Benz engines).

The F.F. Type 33J (150 h.p. Benz) used on the raider "Wolff."

Finally, the main figures are compiled of a few of the out-standing Friedrichshafen naval aircraft :—



Type.	Max. Length.	Max. Span.	Height without trolley.	Distance between Floats	Float Volume.	Horizontal Speed	Speed when leaving water.	Climb.	Flight Duration.	Weight empty without water.	Useful Load.
F.F. 33J	10.3 m	16.7 m.	3.7 m	3.77 m	1 750 litres	115-125 km.	80 km.	1,300 m. in 25 min.	5 hrs.	1,045 kilos	540 kilos
F.F.33L	8 95 ,,	13 2 ,,	4 ,,	2.82 ,,	1,400 ,,	130-140 ,,	85 ,,	2,000 m. in 30 min.	3½ ,,	940 ,,	475 ,,
F.F.41A	13.7 ,,	22 ,,	4.65 ,,	4.5 ,,	3,850 ,,	115-125 ,,	85 ,,	1,000 m. in 25 min.	5 ,,	2,300 ,,	1,370 ,,
F.F.49C	11.6 ,,	16.7 ,,	4 ,,	3.97 ,,	2 300 ,,	130-140 ,,	80 ,,	2,000 m. in 30 min.	5½ ,,	1,485 ,,	650 ,,



TWO INTERESTING NOVELTIES.

Brown Bros., Ltd., are to show two interesting novelties on their stand at the Olympia Motor Show which can be of use to both motorists and aviation firms, aviators, etc. These are the "Glowarm" gloves and the "Boyce" lightning tyre-valve connector.

The "Glowarm" electrically-heated gloves are made of a kind of stockinette material into which are interwoven the very flexible elements made from a special alloy. The current is usually supplied by the lighting system and the gloves give off a gentle and steadily increasing warmth which is exceedingly comfortable. They are supplied for 6 and 12 volts, and are obtainable in three sizes (large, medium, and small). Complete with cable and two-pin plug, socket and clip, the price is 30s. per pair.

The "Boyce" lightning valve connector is an improved form of push-on adaptor which eliminates the screwing and unscrewing of pump connectors to tyre valves. The connector is wired onto the pump flex in place of the present fitting and when it is desired to attach to the valve the attachment is pushed on, and by giving the knurled union a turn the short length of rubber tubing is compressed into the tyre valve thread and firmly locks it. To disconnect it is only necessary to give the union a turn in the opposite direction. Its action can be seen in the accompanying sketch. The price of this handy little fitment is 3s. 6d.

THE NAVAL AIRSHIP S.R.1.

The Italian-built semi-rigid S.R.1 acquired by the Admiralty.

As is well known to anybody who is interested even in the smallest degree in airships, this form of aircraft is of three distinct types—(1) the rigid, (2) the semi-rigid, (3) the non-rigid. These three types all have their separate characteristics and differ very radically from each other.

The rigid, of which the German Zeppelin has been the leading example and which has been developed to a high state of efficiency in this country, consists of a rigid framework composed of wood, duralumin, or some other suitable material, which contains a number of chambers or balloons filled with gas. The semi-rigid is an adaptation of a non-rigid envelope which is reinforced by the addition of a rigid keel from which the principal weights, such as engines and cars, are suspended, and its advantage over the non-rigid comprises its resistance to buckling in the event of the envelope losing pressure.

The non-rigid airship has its weights suspended from the envelope itself and consequently requires an internal pressure slightly in excess of the pressure of the air without to maintain its shape.

Since the early days of British airships, production has been confined entirely to the first and third of these types. The rigid has been exploited for ships of a huge size, while for small ships whose duration of flight could be limited the non-rigid type was selected as being simple in construction and therefore quick and inexpensive to build.

The semi-rigid has been neglected entirely since the days of the Army airships "Beta" and "Gamma," which, though not strictly speaking of this design, employed a long boom in which the car and engines were incorporated.

The Italians, on the other hand, throughout the whole period in which they have been concerned with airships, have relied almost entirely on the semi-rigid principle. Airships of various sizes and different models have been constructed, ranging from the D.E. type of 92,000 cubic feet capacity to the Forlanini of 635,400 cubic feet. The Italians, it must be confessed, appear to be very satisfied with their results, and do not apparently possess any intention of experimenting with the other types, with the possible exception of the rigid.

In the spring of 1918 the Naval authorities in this country came to the conclusion that, however satisfied they might be with the airships which they had built and were building, it would be wise for experimental reasons to acquire, if possible, one of the latest types of semi-rigid ships as employed by the Italians.

With this object in view a party of airship officers visited Italy to inspect the various ships in commission and to report on their suitability for work with the Naval airship squadrons.

On the return of this party it was decided that a ship of the "M" class should be purchased, and three officers and an airship crew were sent over in the late summer of the same year to be present while the ship was inflated and rigged.

This airship was given the number of S.R.1 (semi-rigid 1) and was finally completed about the end of September.

The M class of airship is one of the most successful which has been designed by the Italians and has achieved everything that was expected of it. For several reasons, however, apart from experimental purposes, it is not likely to be of any value to our airship service, as, owing to its design, its speed is, comparatively speaking, slow, and in endurance is not to be compared with the "North Sea," the nearest airship to it in size which we possess.

Its design and construction is so totally different to any airship with which we in this country are familiar that a few words of description will probably prove of considerable interest.

The Italian airships, although all are of semi-rigid design, follow two distinct lines of thought in that the keel, which reinforces a non-rigid envelope, is constructed on two entirely different principles.

In the first system the keel is completely rigid, either enclosed within the envelope or external to it, and assists in maintaining the shape of the envelope.

In the second system the keel is hinged or is in effect a series of rigid links and comparable to the chain employed in cycles. The shape of the ship is therefore maintained by envelope pressure and not by the keel, but the latter, owing to its resistance to compression, enables a lower pressure to be maintained than is possible in the purely non-rigid type of airship.

S.R.1 is designed in accordance with the second of these systems.

The keel is composed of high-tensile steel tubing built up into triangular girder sections, and all connections are universal joints provided with lubricated ball joints which leave it quite free to bend in a vertical plane. This keel is carried throughout the entire length of the ship and is enclosed within the envelope.

It is attached by means of flexible cables secured to the cross girders, which, meeting in pairs in the form of inverted Vs, pass through the ballonet through gastight sleeves to a point about two-thirds of the envelope's height. Here these wires again separate and the two ends are attached to canvas bands suspended from each side of the envelope near the top. Parabolic wires are also provided, sewn to the envelope, which are connected at each end to the side girder lengths of the keel. The keel is covered underneath by a canvas covering sewn to the envelope and laced together at the centre line.

The envelope has six gas compartments and is of a total volume of 450,000 cubic feet. The gas compartments have diaphragms of varnished silk, while the envelope itself is built of two-ply fabric covered with a thin coat of aluminium dope. One single ballonet of approximately 200,000 cubic feet is fitted to the bottom of the envelope and extends throughout its entire length. Fourteen air-valves, fitted with opening and closing controls, are situated along the bottom of the envelope. Air is admitted through a shutter type of valve situated in the nose. Each gas compartment has two valves, making a total of 12, and a ripping patch on the top.

The M ship is fitted with a top and bottom stabilising fin

composed of girder work covered with canvas, and the elevators and rudders are constructed on the box principle, as is universally adopted in all Italian airships.

The car is by no means commodious, and for flights of long duration involves the crew in great discomfort. The frame is made entirely of high-tensile steel tubing, the joints being formed of nickel steel, and the flooring is of wood. In the car are carried, in addition to the machinery, all the petrol, oil, and water ballast required for flight. Bombs, machine-guns, and ammunition are also disposed in the cars, so that it can be readily understood that a very great weight is concentrated in one place, and that a large number of suspensions are required to distribute the load throughout the length of the envelope. These have a tendency to decrease the speed of the ship, but owing to the prevailing winds being light, and for other reasons, speed is considered not to be of paramount importance in the Italian Service.

The forward portion of the car is utilised as a navigating compartment, and here are placed the various instruments, and the controls are accordingly led to this end. The engines—in this case two 200-h.p. Maybachs—are situated amidships on the port and starboard sides, each driving a single propeller astern of the car through a system of gearing and a long tubular shaft.

The Car of S.R.1.

The transmission, according to British ideas, appears to be very heavy and cumbersome, the drive being taken through these long shafts, which introduce universal joints and clutches, which are necessary as the propellers are fitted with adjustable blades for giving variable speed and reverse. The tendency in more recent ships is to dispense with this system and to employ a direct drive with propellers of a fixed pitch.

The car is suspended by means of 16 cables on either side, which, with the exception of the foremost one, are all attached to the side girders of the keel. These are supported in turn by the parabolic wires in the envelope before-mentioned.

In conclusion a summary of the leading dimensions will give some idea of the size of the ship. The same dimensions are also included for the North Sea airship, which will enable interesting comparisons to be made.

	M Type.	North Sea.
Length	290 ft.	262 ft.
Overall width	58 ft.	56 ft. 9 in
Overall height	72 ft.	69 ft. 3 in.
Disposable lift	7,700 lb.	8,500 lb.
Maximum speed	46.5 m.p.h.	57.5 m.p.h.
Capacity	450,000 cu. ft.	360,000 cu. ft.

S.R.1 was flown over to England by a British crew shortly before the signing of the Armistice. During the flight very bad weather was experienced, and, as no shed was available in France in which she could be housed, she had to be moored out in the open whenever it was necessary to descend to replenish fuel.

Fortunately, no disaster was experienced, and the ship arrived finally at her destination, Pulham, in Norfolk.

It escorted the German submarines into Harwich Harbour on the occasion of their surrender, and was seen fairly recently over London when she flew over the metropolis to assist in the Victory Loan. Her peculiar appearance on that occasion caused considerable interest and curiosity. This was not surprising, as no airship like her had been seen over this country before.

AN IMPRESSIVE PUBLICATION.

A. V. Roe and Co., Ltd., who may safely claim to be the pioneers of British aviation, have now attained to the dignity of issuing a large and elaborate catalogue of their productions. It is produced with a magnificence which would not be unworthy of the motor trade at its most prosperous period, and the style of the illustrations appears to follow rather the custom of the motor trade in that instead of being "straight" photographs of the firm's machines, the original photographs have been touched up with wash so that they lose a certain amount of that convincing quality which is obtained from a really cleverly taken photograph. Nevertheless, because of this, the catalogue may carry more weight with those who are accustomed to ordinary commercial catalogues.

The catalogue contains a foreword which gives a short history of the Avro firm. One could have done with more of this history, and something might have been said about the various pilots who, from time to time, have made Avro history, which has been almost always equivalent to making the history of British aviation.

A very fair idea of the shapes of the different types of Avro machines is given on a couple of pages illustrating the evolution of the Avro aeroplane from 1902 to 1915, but one cannot help remarking that a very few pounds extra spent on a more artistically minded artist would greatly have improved these pages. Quite apart from the fact that the pictures themselves are as flat as a foot-print, there are, one believes, technical inaccuracies in the drawing of the machines.

Nevertheless, the catalogue is sufficiently impressive, though one takes leave to state that nothing can possibly impress prospective customers half as much as personal experience of the excellent flying and the equally excellent design and construction of the Avro aeroplanes themselves.

TO CAR OWNERS.

Readers of this paper who own cars, and perhaps more especially those readers who are engaged in selling second-hand cars, will be interested in a composition put on the market by Brown Brothers, Limited, Great Eastern Street, E.C. This composition is called "Radiator Neverleak," and is guaranteed to stop any ordinary leak in a radiator. The composition itself in a liquid and readily mixes with water, and the makers guarantee it to contain no acid or chemical which will injure or clog the cooling system.

It operates by forming a kind of plug—or perhaps one should rather say a species of icicle—on the outside of the leak. This plug, when dry, is insoluble in either hot or cold water or alcohol. "Neverleak" is used simply by adding it to the water already in the radiator, and after the leaks have been stopped it is not necessary to change the water, so that the amount of "Neverleak" which has not actually come into operation remains in the radiator to seal automatically any fresh leaks which may occur.

The composition is sold in two sizes of tins, one at 2s. 6d. for radiators not holding more than three gallons, and one at 3s. 6d. for radiators holding from three to eight gallons. As a comfort to the car user the utility of "Neverleak" is obvious, and as an aid to the seller of second-hand cars its use is perhaps still more obvious.

BY ERROR.

Owing to a printer's error it was stated in The Aeroplane of Oct. 29th, on page 1518, that the price of "Aeroplane Structures," by Mr. A. J. S. Pippard and Capt. J. L. Pritchard was 2s. net. The correct figure is 25s. net.

AIRCRAFT IN PARLIAMENT

HOUSE OF LORDS.

Earl CURZON (the Secretary of State for Foreign Affairs) on October 28th made the following reference to the activities of the Royal Air Force in the course of a speech made in reply to Lord Sydenham on questions relating to the Peace Treaty with Afghanistan.

The Afghans committed a series of acts of unprovoked aggression on the Indian frontier. We were compelled to retaliate. We bombed some of the towns in the interior, and thereupon the Afghans sued for an armistice. In consequence a conference took place at Rawal Pindi, which eventuated in an agreement.

The following is extracted from the answers to questions which the Earl of Wemyss asked the Government on October 30th:—

EAST FORTUNE AIR STATION.

The Marquess of LONDONDERRY said he could assure the noble Earl that the Air Ministry were as fully alive to the interests of economy as the noble Earl himself. At the date of the Armistice there were sixteen airship stations in the United Kingdom. The Admiralty originally intended to retain four rigid airship stations, but in view of the necessity of greatly reducing the programme it was decided that only one station (*i.e.*, Howden) should be retained. Howden would accommodate two ships of the R38 type and one of the R34 type, whereas East Fortune could accommodate only one ship of the R38 type.

With regard to weather conditions at East Fortune, the wind was often a serious difficulty to navigation, coming as it did from the mouth of the Forth The high ground in the vicinity of East Fortune, known as North Berwick Law, constituted a serious danger to airships coming low to find an aerodrome. Howden was more suitable for the airships which they were entitled to contemplate for the future.

The huts and sheds at Howden were of a semi-permanent type To substitute permanent structures would cost £60,000, while to transport the airship sheds at Howden to East Fortune would cost £250,000. The total amount of public money spent on East Fortune from August, 1916, to September 30th, 1919, was £567,700. There were still outstanding liabilities on account of contractors' claims and balances of accounts which were estimated at £35,000. It was anticipated that these claims and balances would be brought to a close at a comparatively early date. Of the total expenditure of £567,700 on East Fortune, the sum of £77,330 had been paid since the Armistice. A certain amount of that payment was due to commitments before the Armistice.

He wished the noble Lord to bear in mind that it was no cheaper to give up a contract when by carrying it out it would add to its value for the purposes of the Disposal Board.

Lord WEMYSS said the reply had been very full and fair. He asked leave to withdraw the motion.

* * *

HOUSE OF COMMONS.

The following oral answer was given on October 28th:—

ROUTE TO EGYPT (CASUALTIES).

Sir WILLIAM JOYNSON-HICKS (*by Private Notice*) asked the Under Secretary of State for the Air Ministry whether his attention had been called to the statements recently made by Col. G. L. P. Henderson as to the serious number of deaths to pilots on the new air route to Egypt, and whether he can make a full statement to the House in regard to the whole position?

The UNDER SECRETARY of STATE for AIR (Major-Gen. Seely): I cannot go into detail within the limits of a Parliamentary answer, but I shall be glad to make a full statement on the first possible occasion.

The broad facts are these:- In the spring and early summer the War Office communicated to us the urgent demands of Egypt for aircraft of large size and endurance in order to cope with the situation, which was described as critical. At the end of March the request was for as many Handley Page machines as could possibly be spared, and at the end of April they telegraphed urgently for additional squadrons. In view of the fact that no Handley Page machine had ever been packed and sent by sea, it was decided that the machines must be sent by air to meet the critical emergency, although considerable risks were necessarily involved.

At the end of April the first squadron was ordered to proceed, and special measures were taken to assist the move of this squadron. An officer with a special and practical knowledge of the route was sent out to arrange for facilities such as landing-grounds, spares, petrol, etc. Flying-boat escorts based on Taranto at first and then on Alexandria were also arranged. The squadron left on May 3rd.

On account of the accidents which occurred, an officer was then stationed at each aerodrome on the route, whose primary duty it was to assist machines in getting through. Great difficulty, however, was experienced by these officers in getting messages by telephone or telegram through in time for action to be taken, and also in getting the necessary spares to the points required, owing to the difficulty of transport. Train communication was equally ineffective. A further difficulty was that owing to rapid demobilisation it was impossible to get the best qualified personnel within the time available.

It was further arranged that replacements for the three squadrons who had gone to Egypt should be sent by air by the staging method. Two pilots and a few mechanics were stationed at each staging aerodrome. At the present moment fifty-one Handley Page machines have left for Egypt; of these twenty-six have arrived, ten are on later stages of the route, and fifteen have been written off.

A month ago the Chief of the Air Staff requested that a special committee of inquiry should be instituted, composed of officers outside his own Department, and that inquiry is now proceeding. I should here like to emphasise the fact that the making of this route had nothing whatever to do with civil aviation, the whole being organised by the Service side. One machine crashed badly and four lives were lost. Three other bad accidents occurred, involving four fatal and four non-fatal injuries.

This loss of life is greatly to be deplored, but it must be borne in mind that the situation was critical, and that prompt action was essential. I am advised that the sending of these machines by sea would have meant that they could not have been ready for action until many months after they were required.

Sir W. JOYNSON-HICKS: Having regard to the very large loss of life and large cost involved, would not the right hon. Gentleman consider the desirability of having a more independent inquiry than that by some officers of the Air Service?

Major-Gen. SEELY: This inquiry is as independent as it can be. The Chief of the Air Staff realised that it was important to have as independent an inquiry as possible a month ago, owing to the accidents involved in transporting this great number of machines over a practically untried route. The officers who are investigating it—I think they must be officers, because practically everyone who understands the air has been in the Air Service during the War—are outside the Department of the Chief of the Air Staff and are quite independent of that Department.

An HON. MEMBER: Who are they?

Major-General SEELY: I know some of them. If the hon. Member will put down a question I will give him full details. The fullest inquiry will be made, and if it be found that a mistake has been made by anyone concerned, from myself downwards, I need hardly say appropriate action will be taken.

Mr. STEWART: How many of the Air Force are missing?

Major-Gen. SEELY: The machines lost—fifteen—have been totally written off and others have been damaged. The total casualties so far are what I have given.

Mr. HOUSTON: When the right hon. Gentleman says fifteen machines have been written off does he mean that these machines have crashed?

Major-Gen. SEELY: It means that they are of no further use—either fallen into the sea or so broken up that they are of no use. Twenty-six have arrived.

The following written answers were given on Oct. 28th:—

BLANDFORD CAMP.

Major-Gen. SEELY, replying to Major Colfax, said that about fifty women are conveyed by lorry from Blandford to the camp. They return home by Service train. The women staff are of two categories—mobile and immobile. The former are housed in the camp. The terms of service of the latter do not allow this to be done compulsorily. As the Records Office is shortly to be moved from Blandford, it is not considered desirable to substitute and train fresh mobile staff to take the place of the latter. Reductions in personnel are continuously taking place, and the women staff show a reduction of 37 per cent. between July 31st and Sept. 30th.

The construction of the railway from Blandford to the camp was started in July, 1919 [1918?], and the line was first used for traffic in February, 1919, whilst still under construction

AIR STATIONS.—ORKNEY AND SHETLAND.

Major-Gen. SEELY, replying to Sir W. Joynson-Hicks, said that the air stations in the Orkneys and Shetlands have been, or are being, closed down with the exception of two. No new huts are being built, but at one of the stations to be retained wooden huts from other stations in the Orkneys and three small aeroplane sheds are being re-erected.

There are three air stations in the Orkney Islands; one of these is being closed down as speedily as possible. There are eight air stations in the Shetland Islands. The personnel of these stations was 292 officers and 1,836 airmen. There are now 21 officers and 305 airmen. As soon as all valuable stores have been evacuated the two stations which are being retained will be placed in charge of care and maintenance parties, except during the months when the fleet is exercising, at which times the personnel will be temporarily increased.

It is not possible without an unjustifiable expenditure of labour to give the total expenditure at those stations during the war on flying and to give the cost per hour of flying. No large quantities of stores have been left in the open, but Major-Gen. Seely is having further inquiries made on the point.

A Court of Inquiry was held in the spring of this year into the causes for deficiencies in the stores of the Shetland Wing. The Court found that, owing to the difficulties experienced in the administration of these outlying stations, the system of storekeeping was in certain instances imperfect, with the result that the book and actual stocks did not agree, both deficiencies and surpluses being shown. The amount of the deficiency was about £1,000.

WOODSFORD AERODROME.

Dr. MACNAMARA, replying to a question Major Colfox asked the Under-Secretary of State for Air, said that he had been asked to reply as the Woodsford Aerodrome is in Admiralty occupation. The completion of the aerodrome as an airship station has been abandoned. A few minor works are still in hand to complete the buildings required for use by the Admiralty. Special workmen's trains are not being run; they were stopped on Sept. 13th. The approximate total cost of the aerodrome will be £185,000. The station is to be used for the temporary storage of machinery. As regards the land, the farm tenant has never been dispossessed of the portion referred to, and is still in occupation. The requisition cannot, however, be withdrawn until the question of the ultimate disposal of the station is settled.

The following oral answer was given on October 29th:—

GERMAN AIRCRAFT.

Sir F. HALL asked the Under Secretary of State for Foreign Affairs if the German Government have been required to furnish particulars of all aircraft and air materials sold or exported since the Armistice; and to pay its value by January 31st, 1920; if the Allies have any definite information that Germany has sold or exported aircraft or air materials to Sweden, contrary to her undertakings; if so, why no practical steps have been taken sooner to prevent such action; and what means will be adopted to ensure that information furnished under this head by Germany in accordance with the requirements of the Allies will be accurate?

Mr. HARMSWORTH: This question is receiving the consideration of the Peace Conference, who are taking all the necessary measures on the matters raised by the hon. and gallant Member.

Sir F. HALL: Is the hon. Gentleman aware that sales of aeronautical material have taken place in Sweden for and on behalf of Germany; who has received the proceeds of those sales; and has the Supreme Council of the Allies declared these sales null and void?

The following written answers were given on October 29th:—

AIRCRAFT FACTORY, FARNBOROUGH.

Mr. HOPE, replying to a question asked the Under Secretary of State to the Air Ministry by Sir W. Joynson-Hicks, said: I have been asked to answer this question. The present strength of the personnel at the Royal Aircraft Establishment, Farnborough, is 2,330, of whom 237 are trade lads and 356 are women. Reductions in staff are continuing, and it is anticipated that the strength will eventually be reduced to 1,200. It is proposed that the factory shall be used in future as an experiment and research establishment for the investigation of aerodynamical and aero-engine problems.

AIRCRAFT PRODUCTION AND INSPECTION DEPARTMENTS.

Mr. HOPE, replying to Sir W. Joynson-Hicks, said: The Aircraft Production Department, of which the Aircraft Inspection Directorate forms a part, is still in existence. The total headquarters staff is 1,932; the annual cost in salaries being £422,897. These figures include the staffs of the three Directorates of Supply, Research, and Inspection, together with the Accounts Branch and other common ser-

vices. The staff of the Aircraft Inspection Directorate alone numbers 300, of which the annual cost is £88,507.

EAST FORTUNE STATION.

Major.-Gen. SEELY, replying to Mr. John Hope, said: I am informed that the payments made for works, buildings, land, machinery and plant, etc., from the date of the Armistice to September 30th have amounted to £77,000. The cost of maintaining the aerodrome in peace time may be estimated at £29,000, but it is difficult to estimate the saving entailed in giving up the station in other directions, as that would depend on the amount of personnel and material transferred to other airship stations.

NO. 2 NORTHERN AIRCRAFT DEPOT.

Major.-Gen. SEELY, replying to a question by Sir W. Joynson-Hicks, asking how many men are employed at No. 2 Northern Aircraft Depot, said: This repair depot is being closed down. The strength at present is 894, or 33 per cent. less than it was at the end of September. The strength will be reduced to a care and maintenance party by the middle of next month. Since October 15th, when repair work ceased, the staff have been employed in clearing up and concentrating stores for disposal.

RECORD DEPARTMENT, BLANDFORD.

Major-Gen. SEELY, replying to Sir W. Joynson-Hicks, said that the number of women clerks and typists employed at Blandford on September 30th, 1919, was 669. Special trains are still run from Bournemouth.

STORES DEPOT, MILTON.

Major-Gen. SEELY, replying to Major D. Davies, said: No. 3 Stores Depot, Milton, near Didcot, is used for the storage of aeroplane spare parts, raw material, soft goods, and canvas hangars. The strength at the present time is 1,648, and it is intended to reduce this number by December 1st next to 1,221. This is one of the three stores depots which it will be necessary to retain for the Royal Air Force.

ORDNANCE SURVEY (AERIAL PHOTOGRAPHY).

Lieut.-Col. MOORE-BRABAZON asked the Under Secretary of State to the Air Ministry what steps, if any, have been taken to use the experience obtained during the War in aerial photography for mapping purposes towards revising and helping in ordnance survey work in England, in view of the fact that so many maps are now out of date?

Major-Gen. SEELY: The Board of Agriculture is responsible for Ordnance Survey Maps. A Committee, with representatives of the War Office, Admiralty, and Air Ministry, have been considering the general question of maps, including those specially required for air purposes, for which, undoubtedly, aerial photography will be of the greatest value.

The following written answers were given on October 30th:—

ROYAL AIR FORCE.—AIR STATIONS.

Major LANE-FOX asked the Under Secretary of State for Air what is the present staff employed at the aerodromes at Tadcaster and Sherburn-in-Elmet, respectively; what has been the average monthly cost of these aerodromes during the past three months; what useful purpose have they fulfilled; and what is the policy of the Government as to their continued existence?

Major-Gen. SEELY: At September 30th, 1919, the number of staff employed at these stations was as follows:—

Tadcaster	242
Sherburn-in-Elmet	89

The average monthly cost during the last three months (July to September) has been £5,700 and £1,700 respectively. This has been greatly reduced during the present month. These stations are being utilised as headquarters for the storage of standard aeroplanes, and can be used for civil aviation purposes. They are to be closed down when the valuable stock now stored there has been evacuated.

Mr. R GWYNNE asked the Under Secretary of State for Air for what purpose the air station at Polegate is still being retained; when the airships were removed; how many men and women were employed there in June last; and how many are employed there at the present time?

Major-Gen. SEELY: As the responsibility for lighter-than-air craft has now been transferred to the Air Ministry, my right hon. Friend the First Lord of the Admiralty has asked me to reply to this question. The airship station at Polegate is being closed down. At the moment it is used for the storage of small airships and stores which are in course of transfer to the Disposal Board. As soon as these have been disposed of the station will be evacuated. The strength at the dates mentioned by my hon. Friend was as follows:—

	June 30th, 1919.	Oct. 28th, 1919.
Royal Air Force—		
Officers	5	2
Other ranks	24	22
W.R.A.F.	15	—
	—	—
	44	24

Four of the personnel (at October 28th) are employed on meteorological duties at Beachy Head.

ROUTE TO EGYPT (LOSSES INQUIRY).

Sir W. JOYNSON-HICKS asked the Under Secretary of State for Air who are the officers making inquiry into the recent losses on the Egypt Route, and if evidence is being taken on oath?

Major-Gen. SEELY: The Members of the Committee of Inquiry referred to by my hon. Friend are as follows:—

President: Air Vice-Marshal F. L. Ellington, C.B., C.M.G., C.B.E., Director-General of Supply and Research, Air Ministry.

Mr. G. B. Cockburn, O.B.E., Head of the Accidents Branch of the Department of the Controller-General of Civil Aviation, Air Ministry.

Air Commodore H. R. M. Brooke-Popham, C.B., C.M.G., D.S.O., A.F.C., Director of Research, Ministry of Munitions.

Air Commodore A. R. Borton, C.M.G., D.S.O., A.F.C.

The last-named officer has had great experience of the work to be investigated by the Committee. He has flown in a Handley Page machine over the route to India and has surveyed part of the route on to Australia. The Committee is not taking evidence on oath.

THE ROYAL AERO CLUB.

GOLF MEETING.

Addington Golf Course, near Croydon, Tuesday, November 18th, 1919, commencing at 9.30 a.m.

MORNING ROUND.—Eighteen holes, under handicap medal round. First prize, value £10, presented by Lt.-Col. F. E. McClean and Lt.-Col. J. T. C. Moore-Brabazon, M.P. Second prize, value £5, presented by Mr. E. W. Touboul.

AFTERNOON ROUND.—Eighteen holes under handicap. Bogey. First prize, value £10, presented by Mr. Stanley May. Second prize, value £5, presented by Lt.-Col. Charles Jarrott.

Handicap limited to eighteen. Entries close Thursday, November 13th, 1919, at 6 p.m. No entrance fee. Members wishing to compete are to forward their names to the Secretary, giving name of golf club and handicap.

November 3rd, 1919. HAROLD E. PERRIN, Secretary.

THE ROYAL AERONAUTICAL SOCIETY.

(SCOTTISH BRANCH).

Sir William Beardmore presided as chairman at a meeting of the Scottish branch of the Royal Aeronautical Society held in Glasgow on Oct. 29th. In the course of the proceedings it was announced that the Council in London had elected Sir William Beardmore, General James G. Weir, Dr. T. Blackwood Murray and Professor J. D. Cormack of the Glasgow University as Fellows of the Society.

The Chairman said that already over 140 members had joined the Scottish branch. Their immediate aim was a membership of 1,000, and when that was attained the Society would be on a self-supporting basis To carry on the work in the meantime the Council proposed to raise an initial establishment fund.

Professor Cormack, who was largely responsible for aircraft equipment and supply during the war, delivered the inaugural address. He pleaded that women ought to be admitted to membership. He did not think that a single aeroplane had been built in Scotland before the war. But during the war a total of 2,250 aeroplanes of seven types were constructed in the country.

The R.34 was a feather in the cap of Glasgow. Flying-boat hulls were constructed on the Clyde and elsewhere, and 2,127 aero engines were constructed. He felt that those who had been pilots or observers should be provided with opportunities of meeting together.

THE METEOROLOGICAL OFFICE.

It is expected that at an early date the reorganisation which will combine the Meteorological Office with the weather services of the Air Ministry, the Navy, and the Royal Engineers will be effected under the Department of the Controller-General of Civil Aviation. The arrangements for this amalgamation are now practically complete. Sir Napier Shaw, the present Director of the Meteorological Office at South Kensington, will be the Director.

The headquarters of the amalgamated services will be at the Air Ministry, Canada House, Kingsway. It is understood that the forecasting department and other departments of the Meteorological Office will be transferred from South Kensington to the Air Ministry, while the statistical department and the library will remain at the present office in Exhibition Road.

The British Rainfall Association, which was founded in 1860, and which has been a very successful private enterprise, will come under the Director of the Meteorological Office, but it is expected that its special work will continue to be carried on at Camden Square.

The combined services will be in close touch with all the Colonial and foreign observatories, and the Air Minister will assume Parliamentary responsibility for the new combined department.

"BLINDED."

The following letter was addressed to the "Times" by Admiral of the Fleet Lord Fisher of Kilverstone, and appeared in that print on Oct. 31st:—

Sir,—It is said of the Jews that "their eyes are blinded to this day" to what is, to us Christians, so transparent a truth. That can be said of the politicians, Parliament, and the public.

It's as clear as daylight that future war at sea absolutely precludes the use of any vessel of war that can't go under water, because aircraft will compel it. So why keep any of the present lot? Not only that, but you've got also to scrap all the admirals and superior officers because they won't do for the new job! Put them all in some museum—like Greenwich Hospital. (Keep the submarines and Co.)

All you want is the present naval side of the Air Force—that's the future Navy—only costing a few millions!

But what is one to say of the Army Estimates being over four hundred millions sterling one year after the most devastating Armistice the world ever heard of? (Are we at war? Who with?) The Navy Estimates the year we built the Dreadnoughts and had war in sight with Germany for certain were only 38 millions sterling!

Four hundred and five millions now for the Army—35 millions then for the Navy! What a contrast. Is the whole nation blinded like the Jews?

And yet "the Articles of War" which were read by the captain in old days (when I first came to sea) every Sabbath Day in the Navy had this preamble in the Act of Parliament:—

"It is upon the Navy whereon, under the good Providence of God, the wealth, peace and safety of this kingdom doth chiefly depend" (or words to that effect).

Yours, FISHER.

EXTRACTS FROM "THE LONDON GAZETTE."

GREAT BRITAIN.

MILITARY.

WAR OFFICE, Oct. 27th.

REGULAR FORCES.—OVERSEAS FORCES.—CANADA.—E. ONTARIO R.—Temp. Lt. G. D. Gillie, M.C., ceased to be secd. to R.A.F. (Sept. 21st) (substituted for "Gazette" notification May 28th, page 6016, incorrectly describing date as May 15th); Temp. Lt. A. E. de M. Jarvis, D.F.C., relinquishes his commn. in the O.M.F.C. on appt. to a Short Service commn. in the R.A.F. (Oct. 9th).

WAR OFFICE, Oct. 28th.

TERRITORIAL FORCE.—INFANTRY.—4TH BN., GLOUC. R.—Sec. Lt. D. Jones to be Lt., and to remain secd. R.A.F. (May 1st); Sec. Lt. W. H Hadfield to be Lt. (May 1st).

6TH BN ARG. AND SUTH'D HIGHRS.—Lt. W. A. S. Brown is secd. for service with R.F.C. (April 23rd, 1916).

WAR OFFICE, Oct. 29th.

REGULAR FORCES.—CORPS OF ROYAL ENGINEERS.—Temp. Sec. Lts., from R.A.F., to be temp. Lts.:—C. W. Pidcock, H. N. Thornton, Sept. 30th. Temp. Sec. Lts., from R.A.F., to be temp. Sec. Lts.:—F. E. West, Sept. 30th; E. A. Stratton, Oct. 6th.

WAR OFFICE, Oct. 30th.

REGULAR FORCES.—ROYAL REGIMENT OF ARTILLERY.—R.H. AND R.F.A.—Lt. C. R. Robbins, M.C., D.F.C., resigns his commn., Oct. 31st, and is granted the rank of Capt.

WAR OFFICE, Oct. 31st.

REGULAR FORCES.—MEMORANDUM.—Observer Officer C. Lillicrap, from R.A.F., to be temp. Lt. for duty with I.W.T., Oct. 16th.

WAR OFFICE, Nov. 1st.

TERRITORIAL FORCE.—INFANTRY.—2ND BN., LOND. R.—Sec. Lt. J. Oliver to be Lt., and remain seconded (R.A.F.), May 1st; Sec. Lt. W. F. List to be Lt., and remain seconded (R.A.F.), May 1st.

AIR FORCE.

AIR MINISTRY, Oct. 24th.

R.A.F.—The classification of Maj. H. J. Newton-Clare, O.B.E., is "T," and not "S.O.," as stated in "Gazette" of Aug. 1st.

The classification of Capt. F. Workman, M.C., is "T," and not "A," as stated in "Gazette" of Aug. 1st.

The classification of Capt. K. R. Park, M.C., is "A," and not "T." as stated in "Gazette" of Aug. 1st.

The classification of Capt. W. P. Groves is "S.O.," and not "T." as stated in "Gazette" of Aug. 1st.

The classification of Capt. G. L. Hunting is "S.O.," and not "T." as stated in "Gazette" of Aug. 1st.

The classification of Capt. A. A. B. Thomson, M.C., is "A.," and not "S." as stated in "Gazette" of Aug. 1st

The classification of Lt. J. M. McEntegart is "S.O.," and not "T." as stated in "Gazette" of Aug. 1st.

The classification of Lt. H. C. Pyper is "S.O.," and not "Ad." as stated in "Gazette" of Aug. 1st.

The classification of Lt. H. O. Long is "O.," and not "Ad." as stated in "Gazette" of Aug. 1st.

The notification in "Gazette" of Sept. 5th concerning Capt. H. W. G. Jones, M.C. (A.), is cancelled. (The notification in "Gazette" of Aug. 1st is to stand.)

Staff Officer, 3rd Class (P.).—Flt. Lt. H. R. Kavanagh, M.B.E., Oct. 15th, vice Flt. Lt. H. H. Clarke.

FLYING BRANCH.—Flt. Lt. J. A. Hartcup to be Flt. Lt. (A.), from (S.O.), Sept. 10th.

Flt. Lt. (actg. Sqdn. Ldr.) N. G. Stewart-Dawson, D.S.C., relinquishes the actg. rank of Sqdn. Ldr. on ceasing to be empld. as Sqdn. Ldr. (A. and S.), Oct. 15th.

Pilot Officer J. L. Airey to be Flying Officer, Aug. 7th.

The following relinquish their commns. on ceasing to be empld.:—Sec. Lt. C. Maddox (Sec. Lt., Welsh R.), July 14th; Lt. (Hon. Capt.) O. M. Greg (Capt., R. War. R.), Sept. 18th; Lt. E. J. Dease (Sec. Lt., Rif. Brig.), Lt. M. Tod (Lt., Black Watch), Sec. Lt. (Hon. Lt.) C. R. A. Wallis (Lt., R.G.A.), Oct. 8th; Capt. W. McKay (Lt., Sea. Highrs.), Lt. F. Coxen (Lt., R.F.A.), Oct. 13th; Lt. R. S. Butler (E. Surr. R.), Oct. 14th; Capt. C. Gordon-Davis (Capt., N. Staff. R.), Maj. A. P. Pargiter, M.C. (Capt., R. Ir. Regt.), Oct. 15th.

Transferred to unempld. list:—Sec. Lt. N. P. Aldred, Sec. Lt. B. R. Brinton, Sec. Lt. R. H. Cole, Sec. Lt. J. W. Grier, Sec. Lt. W. J. Hoxworth, Sec. Lt. E. A. Hunt, Sec. Lt. E. L. R. King, Sec. Lt. BURBERRY
CARAPACE AIR-SUIT

Illustrated Catalogue & Patterns Post Free

Every Burberry Garment bears a Burberry Label.

BURBERRY CARAPACE AIR-SUIT

Worn by Sir John Alcock on his Trans-Atlantic Flight.

The Carapace Air-Suit is made up of three layers, each of a different material, scientifically combined to ensure the greatest possible resistance to wet or cold. The outside is of Burberry Gabardine so densely woven and proofed that it will withstand intense pressure from wind or rain.

The second layer is in the form of a luxurious lining of Fleece, that supplies a wealth of warmth, yet is extremely light.

The innermost lining is of Glissade, a smooth surfaced material, which enables the airman to slip into or out of the suit with celerity.

A double plastron of Burberry Gabardine across the chest and shoulders, a Burberry Puttee Collar, an adjustable waist-belt, and devices for tightening the sleeves and legs add comfort and stability to an outfit which ensures complete security, yet is much less weighty and cumbersome than leather kit.

BURBERRY MATERIALS ventilate naturally and thus avoid the condensed moisture which cold causes to form on the inner surface of air-tight fabrics, rendering them useless for flying.

Complete Flying Kit in 2 to 4 Days ready for use.

A Steel that hardens True

Edgar Allen's standardized oil-hardening steel is the enemy of distortion. It practically eliminates expansion or contraction due to hardening, and is uniform in grain and composition. These properties make it specially suitable for tools of extreme accuracy.

Edgar Allen's
K.9
Oil-hardening Steel

can therefore be used with confidence for Dies, Stay Taps, Milling Cutters, Plugs, Gauges, and Master Tools. A small piece for trial purposes will be sent free, on receipt of a request stating the name of the firm.

Write for K.9 Folder

which reproduces an untouched photograph of a fracture, showing the fine grain and uniformity of this steel. Instructions for hardening are also given.

Lt. F. C. Rayson to be Lt., Grade (B), from A'ship, July 17th (substituted for notification in the "Gazette" of Sept. 5th).

Sec. Lts. to be Lts. :—P. S. Riach, April 15th, 1918 (without pay and allowances of that rank prior to May 1st, 1918); C. C. Parrott, Jan. 29th (without pay and allowances of that rank prior to March 13th) (substituted for notification in the "Gazette" of April 4th); Sec. Lt. (Hon. Lt.) C. J. Poole is graded for purposes of pay and allowances as Lt. whilst empld. as Lt., Grade (B), from May 1st to July 31st.

Sec. Lts. to be Lts. without the pay and allowances of that rank :—J. Butcher, G. G. Hargrave, April 2nd, 1918.

Sec. Lt. S. Graves to be Sec. Lt., Grade (B), from (A.), June 7th.

Transferred to the unempld. list :—Sec. Lt. H. E. Brain, Sept. 13th (substituted for notification in the "Gazette" of Sept. 30th); Capt. F. H. Burgess, Sept 15th; Lt. J. W. Askham, Sept. 17th; Lt. M. V. Barton, Sept. 25th; Sec. Lt. J. O. H. Norris, Sept. 27th; Sec. Lt. H. J. Kibble, Capt. G. Sykes, M.B.E., Sept. 28th; Lt. R. M. Baird, Sept. 30th; Capt. H. G. Harrison, Oct. 8th; Maj. S. T. Baker, Sec. Lt. A. Shepheard, Oct. 9th Sec. Lt. (Hon. Lt.) J. C. Boughton, Sec. Lt. W. S. Hay, Lt. M. E. Holroyd, Sec. Lt. R. H. Nicol, Lt. W. B. Rayner, Lt. H. F. Wilkinson, Oct. 10th; Sec. Lt. J. A. Anderson, Lt. A. W. Armstrong, Sec. Lt. A. A. Gardner, Sec. Lt. (Hon. Lt.) H. Hellier, Capt. J. Honey, Lt. P. H. Paul, Capt. W. H. B. Sandes, Lt. (Hon. Capt.) C. Shears, Lt. C. R. Heber-Trevor, Oct. 11th; Capt. G. E. Lucksted, Maj. R. Orme, Oct. 12th; Capt. H. R. Lecomber, O.B.E., Lt. T. C. Martin, Lt. J. G. Peacock, Oct. 13th; Lt. L. E. Heather, Sec. Lt. E. S. Olney, Oct. 14th; Lt. C. A. Brook, Sec. Lt. H. L. Vahey, Oct. 15th; Lt. (actg. Capt.) J. R. Frankish, M.B.E., Sec. Lt. M. Thompson, Lt. W. S. Vale, Sec. Lt. H. S. Whitley, Capt. C. W. Willcox, Oct. 16th; Capt. T. J. Hamp, Capt. H. L. Hill, Capt. W. H. Sharpe, Capt. R. C. Shortt, Lt. C. J. Strother, M.B.E., Oct. 17th; Lt. T. McI. Mackay, Sec. Lt. J. E. Tyrrell, Maj. S. M. Cleverley, Oct. 18th; Capt. C. Fairbairn, Lt. N. V. Harle, Capt. R. Stephenson-Peach, M.B.E., Sec. Lt. F. C. Warren, Oct. 21st; Sec. Lt. R. C. Carline, Capt. J. K. Fryer-Smith, Oct. 22nd; Lt.-Col. H. Burchall, D.S.O., Lt. J. R. Shanks, Sec. Lt. (Hon. Lt.) A. E. Thorne, Lt. F. Tingle, Sec. Lt. E. T. E. Welburn, Oct. 23rd.

Capt. H. Lancaster (Norf. R.) relinquishes his commn. on account of ill-health, Oct 20th.

The notification in "Gazette" of April 29th concerning Sec. Lt. (Hon Lt.) R. W. V. Midlane is cancelled.
The notification in "Gazette" of June 3rd concerning Sec. Lt. (Hon. Lt.) R. W. V. Midland is cancelled.
The notification in "Gazette" of May 30th concerning Sec. Lt. G. R. Wills is cancelled.

MEDICAL BRANCH.—Transferred to the unempld. list:—Capt. R. B. Adams, Sept. 10th; Capt. (actg. Maj.) J. M. Kirkness, Sept. 13th; Capt. S. G. Smith, Sept. 28th (ssubstituted for notification in "Gazette" of Oct. 10th, wherein this officer was shown as Lt.); Capt. A. D. Kennedy, Oct. 9th.

MEMORANDA.—The following temp. Hon. Lts. relinquish their commns. on ceasing to be empld.:—J. B. Mitchell, R. K. Roberts, J. P. Tweedy, Sept. 16th; E. D. Burley, H. E. Portsmouth, H. E. G. Rowley, R. G. Sharp, Oct. 16th.

Transferred to the unempld. list:—Sec. Lt. P. Gent, from (S.O.), Capt. J. E. A. Greatorex, from (S.O.), Lt. P. E. Stubbs, from (S.O.), Oct. 14th; Lt.-Col. F. R. Drake, C.B.E., from (S.O.), Capt. R. G. Mitchell, O.B.E., from (S.O.), Sec. Lt. E. A. Cogswell, from (S.O.), Lt. J. E. D. Samuel, from (S.O.), Oct. 15th; Capt. H. E. Weaver, from (S.O.), Oct. 16th; Capt. E. H. Haworth, from (S.O.), Oct. 17th.

Sec. Lt. G. P. Pinney relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Oct. 8th.

The notification in the "Gazette" of Oct. 10th concerning temp. Hon. Lt. (Hon. Capt.) W. S. Kellar is cancelled.

PERSONAL NOTICES.

NAVAL.

ENGAGEMENT.

HARDMAN—BUSHBY.—The engagement is announced between Capt. Edmund Parfitt Hardman, D.F.C., son of the late John Bernard Hardman, of Edgbaston, Birmingham, and Mrs. Hardman, of 25, Fitzgeorge Avenue, London, and Betty, youngest daughter of the late Percival White Bushby and Mrs. Bushby, of Torquay, and youngest step-daughter of Capt. Arthur P. James, R.N., of Braydon Hall, Minety, Wiltshire.

BIRTH.

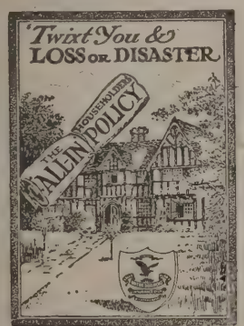
READ.—On Nov. 3rd, at 4, Grove Road, Frindsbury, Rochester, to the wife of Capt. S. J. Read, R.A.F. (Payr. Lt., R.N.)—a daughter.

MILITARY.

ENGAGEMENT.

CAVE—PIGGIN.—The engagement is announced of Capt. T. Walford Cave, M.C., R.F.A., R.A.F., eldest son of the Rev. Thomas Cave, vicar of St. James, Handsworth Wood, Birmingham, and Gwendolin Mary, only daughter of Herbert H. and Mrs. Piggin, of Hendon Hall, N.W.

AIR FORCE.



DEATH.

KNIGHT.—Capt. Gerald Fetherston Knight, R.A.F., who died at the R.A.F. Hospital, Eaton Square, on Oct. 30th, was the son of Robert Lynam and Lena Fetherston Knight, and the grandson of the Rev. Robert Knight, late of "Stanmore," Torquay. His death was caused by illness contracted while a prisoner in Germany. Some two years ago Capt. Knight escaped into Holland from the prisoners' camp at Strösken, and his experiences are described in his book "Brother Bosch," which was published recently.

Cover ALL your Household Risks by the
"ALL-IN" POLICY

NOW is a good time to consolidate all your domestic Insurances under One Policy, with One Premium and One Renewal Date, by taking up an "ALL-IN-" Policy which, for an inclusive premium of 5s. per £100 per annum (minimum premium 7s. 6d.), covers practically every serious risk to which the Householder is liable in respect to the contents of his home. The Policy is renewed free every sixth year if no claim has been made.

N.B. If you have policies in force terminating at different dates you can immediately enjoy the benefits of the "ALL-IN" Policy, full deduction from the Premium payable being allowed by the Company for the period in respect to risks for which policies are still in force.

A Special "ALL-IN" Policy for Houseowners covers the building only for 1/6 per £100

Write at once for full particulars and take up an "ALL-IN" Policy and thus free yourself from all anxiety of monetary loss in respect to your home. Address "ALL-IN" Policy Dept., 41, Threadneedle Street, E.C.2.

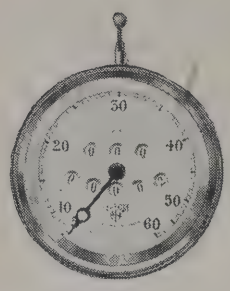
THE AEROPLANE IN THE GREAT WAR.
Air Thrills and Heroic Adventures.
An entirely new Publication just published, written by Mr. W. L. WADE.

The Author is well qualified to handle such a subject in its true perspective. He has been actively associated with Aeronauts since 1908, and this period represents the whole lifetime of Practical Aviation.

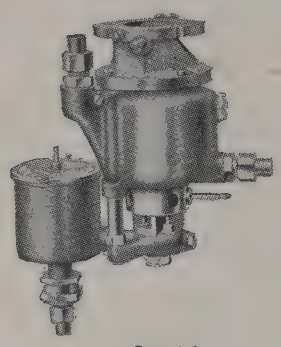
For several years he was connected with THE AEROPLANE newspaper, and has followed the whole progress of Aerial Warfare from a vantage point available to few. He has been in a position to collect information denied even to the Flying Officer whose fund of knowledge is normally confined to the immoderate area of his own operations.

A true story showing how the Royal Air Force and other flying Services, both friendly and enemy, have all grown up and developed in direct association with the Armies and Navies with which they have worked.



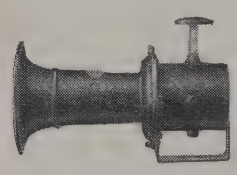
THE BOOK IS BEAUTIFULLY BOUND IN CLOTH AND FULLY ILLUSTRATED IN COLOUR AND BLACK AND WHITE.

The Artist, MR. GEOFFREY WATSON, has the gift of portraying artistically and realistically Aeroplanes as they appear in the air. His work has the merit of unrivalled accuracy in every detail. Great pains have been taken to confine this volume to facts.

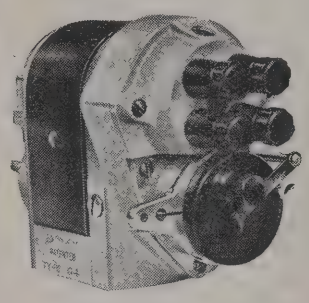


In years to come this Volume should be a reminder of deeds which otherwise would have been lost in the oblivion of time.

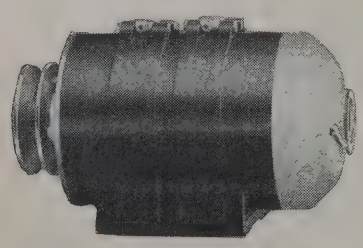
Price 16s. net. To be obtained at all Messrs. W. H. Smith and Sons' bookstalls, and all booksellers, or from Virtue and Company, 7, City Garden Row, London, N.1.



The Smith Equipment



The Smith British Speedometer
(Flush Fitting Model)



The Smith Five-Jet Carburetter
(Vertical Model)

The Smith "Safety First" Warning Signal
(Pleasure Car Model)

The M.L. Magneto
Type Nos. G3, G4, and G6.

The Smith Lighting Dynamo.

comprises the most complete and the most up-to-date range of motor accessories ever offered.

Every article is built to the highest standards of quality and efficiency and is guaranteed thoroughly reliable in operation. Prolonged expensive and independent tests prove them worthy the paramount place as post-war accessories.

That is why they are being standardised by nearly all the leading British Car Manufacturers.

GRAY CO.

NOTES ABOUT THE OLYMPIA MOTOR SHOW.

THE OLYMPIA MOTOR SHOW.

Many of the firms primarily engaged in aeronautical work are also interested in the automobile industry, and it is therefore thought desirable to publish the following notes for their information. The Motor Show which will open on Nov. 7th has additional interest in that it is the first to be held since 1913. The public have had little opportunity to estimate the progress made in motor engineering in the intervening years.

All the firms whose work is outlined in the following notes have during the war been engaged in aeronautics and have contributed ably to the successes attained by the Royal Air Force. The influence of the experience gained by these firms in aeronautical matters has served to add improvements to engines and car bodies which were already excellent in their way.

THE CULT OF PERFECTION.

As a schoolboy learnt to recognise a car by the radiator form, so a connoisseur in motor-carriages could tell, by the look of good taste and refinement in a coach body, the product of the Regent Carriage Co. It is, perhaps, natural that a firm, who had attained perfection in the old-fashioned craftsmanship handed down to them from the days when woodworking was a great British art, should be in a position at the outbreak of war to reorganise their extensive shops for the construction of aircraft and commence straight-away on production work.

Much of our success in the air has been due to the excellent work put into our machines by skilled artisans who have been accustomed to turn out fine jobs long before the A.I.D. existed. In the early days of the war, Mr. Myles Scarff, the able managing director of the Regent Carriage Co., realised that his firm with so experienced a staff would become a valuable asset to the nation, and, consequently, reorganised and expanded the works. As a result they were soon in a position to, and did turn out many types of aircraft, thousands of motor-lorries, ambulances and aeroplane trailers.

The firm manufacture all the metal parts for their work, and although the factory was replete with all types of wood-working machinery, every new labour-saving device placed on the market was carefully studied, and, if found satisfactory, it was installed within model workshops.

As an instance of their painstaking and thorough methods, the varnishing room can be taken as an example. The room contains the most approved and modern heating apparatus, and has a specially constructed floor so as to make it quite dustproof. Before a coach-body is varnished, both coach and room are thoroughly swilled down with a water-hose so as to remove every particle of dust. Even the workers must cover or remove all woollen articles of apparel before working in this room.

With their pre-war experience, and the result of the knowledge gained in building aircraft, where they have learned how bodies can be made lighter, stronger and more artistic in appearance, the British public can rely on the Regent Carriage Co. to hold its own against any competition, American or otherwise, and that it will contribute in keeping British industry and commerce in its premier position throughout the world.

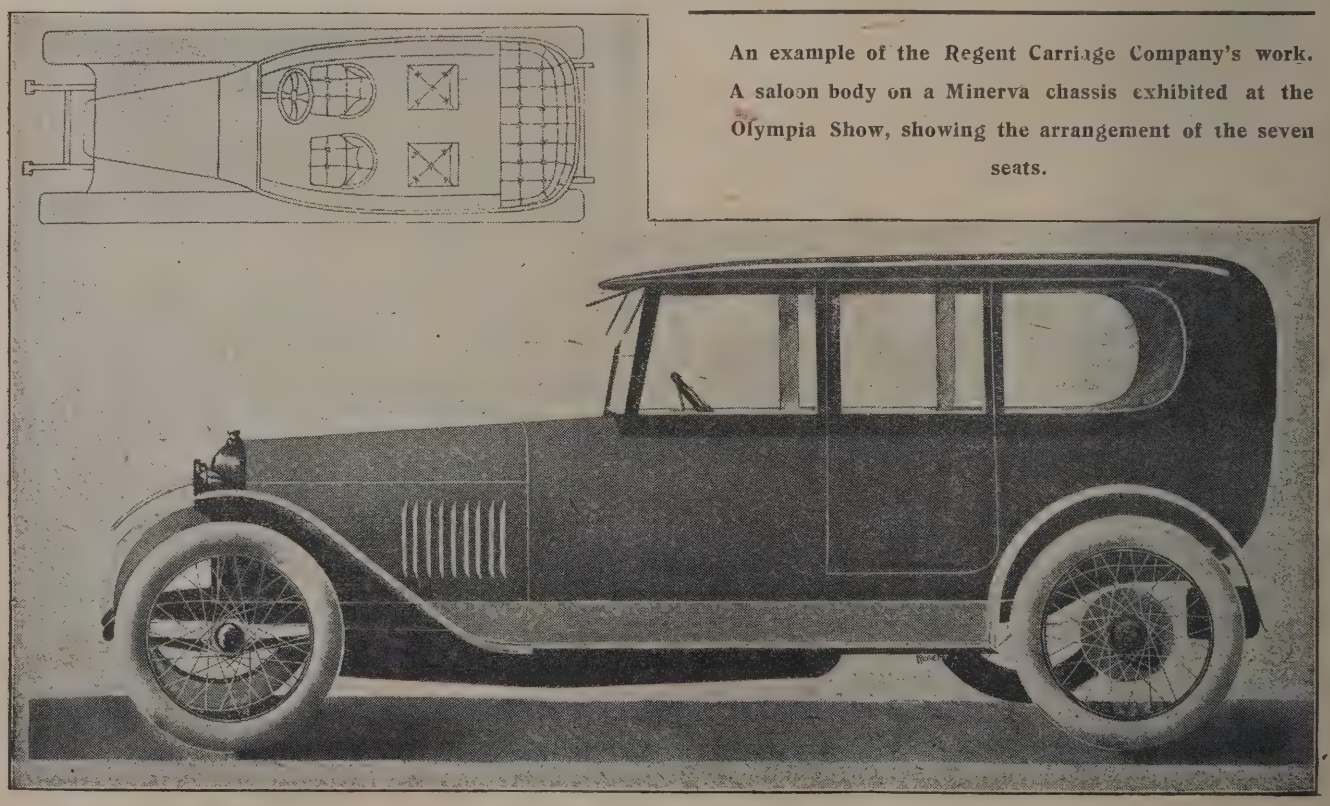
THE ARROL-JOHNSTON CAR AT THE OLYMPIA SHOW.

The Arrol-Johnston Co. is exhibiting two models at the Olympia Show—a "Victory" car and a new 15.9 h.p. car.

The "Victory" model has a four-cylinder engine, with a bore of 80 mm. and a stroke of 140 mm. The R.A.C. rating is, therefore, 15.9 h.p. Unlike earlier cars made by this company, overhead valves are used. The lubrication is automatic. A four-speed gear-box is fitted.

Both brakes operate on the rear wheels. Detachable steel wheels are supplied.

The body is an open five-seater, in which the driver's seat is adjustable, so that comfort is obtainable without adjusting one's own body to the design of the car. A C.A.V. lighting and starting outfit is supplied.



One of these cars has been supplied to H.R.H. the Prince of Wales, K.G.

The 15.9 h.p. model is that on which the Arrol-Johnston Co. has built its great reputation. The stroke is 20 mm. shorter than that of the "Victory" model, and overhead valves are not used. This car also has both brakes operating on the rear wheels. Electric lighting and starting are installed.

The Arrol-Johnston firm, which is one of the subsidiary companies of William Beardmore and Co., Ltd., has devoted its efforts during the war mainly to the building of aero engines, notably the B.H.P. Their experience in these matters cannot fail to have influenced the design and construction of their car engines.

THE SKOOTAMOTA.

At a recent board meeting of the Gilbert Campling Company, Ltd., the price of the A.B.C. Skootamota was considered, and it was decided to advance the selling price of each machine to 49 guineas.

An example of the Regent Carriage Company's work. A saloon body on a Minerva chassis exhibited at the Olympia Show, showing the arrangement of the seven seats.

THE EXHIBITS OF WILLIAM COLE AND SONS, LTD.

Another firm which during the war built aeroplanes for the Government is William Cole and Sons, Ltd. Their long experience of designing and building car bodies of the highest class naturally helped them in their war work in aeronautics. They have now returned to their original work, and three specimens of their skill will be exhibited at the forthcoming show. The description of these is given below.

A 30 h.p. Daimler (not the "light thirty") equipped with a standard Daimler electric light and starting set, also wire wheels; fitted with Cole four-seated Cabriolet body. The body covers the full length of the chassis. It is capable of seating six people quite comfortably, although only constructed with one door each side. The seating capacity is of the usual Cole arrangement, namely, detachable spring cushion at back, and two Cole patent sliding chair seats, which are of specially light construction, with patent undercarriage to give freedom of movement. These are operated at the side by means of a small trigger lever. Two very light folding chairs are also supplied to seat two extra passengers, the chairs when not required folding away in pockets at the back of the chair seats.

The Cole patent hood opens or closes in one movement. A special point in this connection is the ease of action and general simplicity considering the length of body. In spite of this length the appearance is the same as the standard four-seater type of body, which is comparable to a comfortable two-seater. The hood is covered with the best enamel leather; the interior is trimmed with the usual quartered and inlaid choice woods highly polished. The instrument board is of polished wood to match. A V-shape wind screen is fitted, with top portion of each side made to open.

A 25 h.p. Vauxhall, fitted with standard model four-seated Cabriolet. The general details are as above, with the exception of the wind screen, which is of the straight pattern. A special feature of this body is the front pillars, which are of very light wood construction. It provides seating accommodation for four or five people, and is trimmed in grey leather and cloth.

A 25 h.p. Talbot with Cole Standard Imperial Limousine Landaulette body. Frameless windows are fitted throughout, and are raised or lowered by special lever arrangement instead of glass strings. The seating inside is for four or five passengers, and one passenger can sit in front beside the driver.

INSTRUMENTS AND ACCESSORIES.

Before the war, S. Smith and Sons (M.A.), Ltd., were known as the foremost Motor Accessories House, not only in Great Britain, but throughout the world. During the war their entire output consisted of instruments for aircraft, and they claim to have produced more aviation instruments for the British and Allied Governments than any other firm. As a result of the experience thus gained they have been enabled to perfect their vast organisation for the production of post-war accessories.

At the Olympia Motor Show, which opens to the public on the 7th inst., S. Smith and Sons will show on their stand (No. 345) specimens of their complete and up-to-date range of motor accessories, and will include examples of the following Smith products:—Speedometers, revolution indicators, air speed indicators, motor-clocks, pressure gauges, petrol tank gauges, carburetters, starting and lighting systems, electrical, mechanical and bulb horns, mascots, canteens and interior fittings, tyre pumps, double acting jacks, and also M-L. magnetos, K.L.G. sparking plugs, Euk easy starters, etc., for which S. Smith and Sons (M.A.), Ltd., are the sole selling agents.

The M-L Magneto Syndicate, Ltd., for whom S. Smith and Sons are the sole selling agents, will have a separate stand (No. 346), where all types of M-L. magnetos will be exhibited and demonstrated.

In pre-war days the usual practice was for a man to buy his car, and then fit all the accessories at additional heavy cost, but the post-war principle and ideal, which is showing itself in the policy of some motor manufacturers to turn out cars "ready-for-the-road," will tend to make motoring much more popular in the days to come.

Before the war 13 out of 14 British car manufacturers standardising instruments fitted the Smith equipment, and there is no doubt that most of the post-war cars will be similarly fitted and equipped.

Every article has undergone a complete change in design, its quality consistently improved, the finish and durability perfected, its operation made absolutely reliable and prolonged, expensive and independent tests have proved them worthy of the paramount place as post-war accessories.

THE ANGLO-AMERICAN OIL CO., LTD., AT OLYMPIA.

The Anglo-American Oil Co. will be exhibiting all their grades of motor spirit, illuminating and fuel oils at the Olympia Motor Show which opens on Nov. 7th.

The range includes Pratt's "Aviation" spirit as used by the R.34 on its East Fortune-Mineola-Pulham flight; Pratt's "Perfection" spirit, in the familiar green can, suitable for all classes of motor vehicles and motor boats; "Taxibus" spirit; Anglo's benzol; "Victory" spirit, a well-balanced petrol-benzol blend for all types of cars; "White Rose," "Royal Daylight," and "Crown Diamond" refined oils for domestic uses; Anglo's vaporising oil for oil-engines and agricultural tractors, as used at the Lincoln Tractor Trials in September, 1919; fuel oil for bunkers, Diesel engines, steam-raising, etc.; gas oil for motor-boats; and "Valor Perfection" oil for cooking and heating stoves.

THE GOOD COMRADE.

In connection with the proposed Australian flight the Sopwith Co. were desirous of obtaining certain information respecting the running of the Rolls-Royce "Eagle VIII" engine with which their machine is fitted, and so got into communication with the Aircraft Manufacturing Co., Ltd., as being the aircraft firm who have had most experience with that engine, and asked if they would have any objection to their seeing the log-books, etc., of the engines used in the successful London-Paris service. Brig.-Gen. Festing very courteously replied that they could have access to any figures or information that would be of any use to them respecting the running of the "Eagle VIII" under various conditions.

It is indeed encouraging to see that such a spirit of sportsmanship exists even in this age of commercialism, but General Festing was ever a good comrade.

A SPORTING VENTURE.

BATTLEFIELD BUREAU, LIMITED.—Private company registered Oct. 9th. Capital, £3,000 in 2,000 8 per cent. part preference shares of £1 each and 4,000 ordinary shares of 5s. each. To carry on the business of tourist and shipping agents, hotel proprietors, owners of aerial, motor and horse conveyances, etc. The subscribers are:

H. H. Beamish, 175, Piccadilly, W., newspaper proprietor	10	10

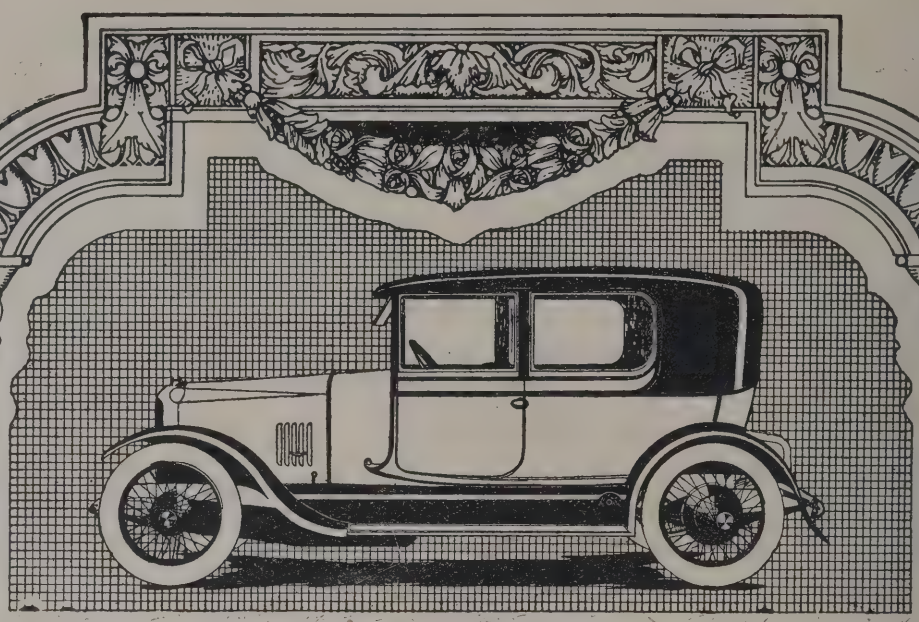
Table "A" mainly applies. Qualification, £100. Solicitor: W. H. Behrens, 3, London Wall Buildings, E.C.

QUICK DELIVERY.

The following letter has been received:—

Sir,—One hears a lot of the advantages of sending mail of all description by air; presumably the greatest merit of the aerial post is its supposed speed. In two recent experiences of mine this has proved its very drawback. I will quote the latter as an example. My brother in Paris sent over a small gift by air, as he particularly wished it to reach me in the course of the next three days (this was 11 days ago). The first intimation I had as to its arrival was an incorrectly addressed letter from a (foreign) firm of carriers, stating that if I would be "good enough to forward them the small sum of 7s. 6d. for clearance they would forward the parcel at once." Knowing that my brother must have paid all charges, I sent a post-dated cheque, asking for particulars of the charges referred to. I did not date the cheque late enough, however, and after waiting to cash it they wrote and informed me that these were the "usual charges," and enclosed a Customs form for me to fill up. I filled this up and returned it, and four days later received another form to fill up before a Commissioner for Oaths (another 1s. 6d.!). This I did and returned the form. I have not even yet received the parcel!

If these are the "quick" methods adopted by our civil aviation firms no wonder civilian flying is not "booming"! I for one shall certainly send all my mail by post in future, on the ordinary land and sea routes.



Further to the disadvantages related above, in neither case was I able to obtain any information as to where my parcel could be found should I wish to collect it myself, and my inquiries as to the whereabouts of the aerodrome upon which it was landed were politely ignored!

(Signed) "BOAZ."

[Further particulars concerning the circumstances related in this letter may be obtained by any aerial transport firm which knows that its methods of delivery are more rapid and reasonable than those mentioned.—ED.]

THE WHITEHEAD AERODROME CANTEEN CLUB.

The Feltham Justices on Oct. 27th made an order striking the Whitehead Aerodrome Canteen Club, Hanworth Park, off the list of registered clubs. An inspector stated that the firm had gone into bankruptcy, and that the works were closed.

Cole Carriages at Olympia

THE 4-SEATED C.C.C. ON 30 H.P. DAIMLER
THE 4-SEATED C.C.C. ON 25 H.P. VAUXHALL
AND
COLE IMPERIAL LANDAULETTE-LIMOUSINE ON 25 H.P. TALBOT

THE Cole Coupe Cabriolet—popularly designated the C.C.C.—is the master four-seated all-purpose carriage. It was the original idea of Wm. Cole & Sons, Ltd.—in conception, in execution, and in name. The C.C.C. created the fashion in the all-open or all-closed car at will; it leads the fashion; it leaves imitations ten years behind in beauty of design, graceful appearance and exquisite finish. It is incomparable in execution of workmanship.

THE series of Cole Imperial Coachwork represent the highest standard of the coachbuilders' art. Every design gives the requisite suggestion of modishness without exceeding the bounds of dignity; luxurious while retaining quiet distinction. An exclusive atmosphere surrounds every production, and bears the impress of ripe experience and master craftsmanship.

ON ONE HUNDRED SQUADRONS.

It is an old saying that one has to go abroad to get news of things at home, and it is a very true saying. The latest example is a brief paragraph which appeared in the Paris paper "L'Auto" one day last week saying :—

"Le maréchal Wilson demandait a maintenir cent escadrilles á 18 appareils; le budget etait de 65 millions de livres sterling. Le gouvernement a reduit les escadrilles á 51 et le budget á 25 millions de livres. Sur ces 51 escadrilles, 13 sont employees dans les camps d'instruction, et sur les 38 escadrilles actives qui restent, 18 sont prevues pour la defense de l'Angleterre et 20 pour le resies de l'empire."

Leaving out what the Government has done according to the second part of the paragraph, this being interpreted means that Field-Marshal Sir Henry Wilson, Chief of the Imperial General Staff, has demanded that the British Army shall have at its disposal, ready for war at any moment, one hundred squadrons of military aeroplanes, as distinct from seaplanes, ship-planes, torpedo-planes, flying-boats, and other varieties of aircraft not suitable to co-operate with an Army in the Field.

Now, 'L'Auto" is a singularly well-informed paper. Also there has been a rumour to very similar effect floating about in other than R.A.F. circles for some time. Also, though one may not have a high regard for Sir Henry Wilson's political associates, one believes him to be a soldier of great ability and of a very enlightened outlook. And so the statement of "L'Auto" and the military rumour would seem to have a reasonable foundation of probability.

Furthermore, Sir Henry Wilson being in high favour among politicians in power at the moment—as one judges from the fact that Sir William Robertson, a very great soldier indeed, was displaced to make room for him, and that Sir Henry Wilson was made a Field-Marshal when Sir William Robertson, despite all his great services, was not—is very likely to have his way, despite all opposition from the Treasury, the Bolshevists, and the Pacifists. Therefore it seems worth while to discuss the hundred squadrons mentioned in the statement as being within the bounds of possibility.

The Three Services Again.

The mere idea of having a hundred squadrons for the Army alone naturally obliges one to consider the position of the Air Ministry in the case of such an eventuality. If the Army is to have those squadrons, are they to be part and parcel of the Army, or are they to be supplied to the Army by the Royal Air Force? The answer to the conundrum seems to depend largely on the solution of the problem propounded last week—namely, whether the Navy is to take over all the sea-going personnel and matériel of the R.A.F. and revive the Royal Naval Air Service, or whether the R.A.F. is to take over the Navy?

One has never been a believer in the ability of a single Air Force to do all the air work of the Navy and the Army, let alone the work proper to an Independent Air Force in addition. When a crowd of misguided politicians started the agitation for this single Air Force in 1916 one was strongly opposed to it, and one has never found any reason to alter one's opinion. The lamentable deterioration in quality of aviators and aircraft alike since the R.A.F. came into being in 1918 has confirmed one's first impressions of the evils of the single Air Force idea.

When this idea was first propounded in 1916, one stated definitely that a naval aviator ought to be a naval officer or rating, and that an aviator working with the Army ought to be a soldier, first, foremost, and all the time. A seaplane or an aeroplane is merely a vehicle conveying a sailor or a soldier on his lawful occasions. At the same time one expressed the opinion that there might be room for a Third Service, consisting of an Air Fleet for use on occasions when neither the Army nor the Navy was necessary, or to co-operate with the two senior Services in the general strategy of a war, but employing its own minor strategy and tactics.

The Three Services in Being.

Something approaching this state of affairs actually occurred in the last stages of the recent war. The Navy was co-operating, after a fashion, with the Army in a mild offensive against the enemy's coasts in Belgium, Bulgaria, and Palestine. The R.A.F. in France, under General J. M. Salmond, was to all intents and purposes part and parcel of the Army—even to the extent of local Army Commanders having power to suspend or supersede R.A.F. officers. The R.A.F. in the East, under General W. G. H. Salmond, was equally part and parcel of the Army in the East, though its sea-going units were a badly mishandled part of the Navy.

At the same time General Sir Hugh Trenchard's Independent Force, R.A.F., was an absolutely distinct Service, conducting its own campaign against the interior of Germany in accordance with the general strategy of the war, but entirely independent of the Army's strategy. On occasion the Independent Force took part in Army operations, as in preparing the ground for offensives by the French and American Armies in Alsace-Lorraine, but this was a precise parallel to the work of the Navy in bombarding the enemy's coastal positions, albeit the R.A.F.'s work was considerably more effective.

The Justification of the Independent Force.

The operations of the Independent Force were excellently planned and very well executed. That they were not superlatively well executed was no fault of the G.O.C., nor of his Staff, nor of the personnel of the I.F. Where they failed to do all that might have been done in the way of smashing the Rhine cities and bombing Berlin, the failure was due entirely to defective material. And that defective material was due altogether to the crazy idea of a single Air Force, which forced the Navy, the Army, and the Independent Force to depend for their aircraft matériel on a single line of supply, which

line was blocked at intervals by little groups of the most amazing fools or the most virulent knaves in the history of war.

In spite of this hindrance the Independent Force more than justified its existence. And there is no doubt that if hostilities had not come to a premature end the Independent Force would have acquired better matériel and would in the next six months have induced in the German people a very much more humble frame of mind than that in which they were when fighting ceased, and than that in which they are to-day.

Independent Command.

It must be evident, even to the comprehension of a politician, that the Command of the Air over an enemy country will produce a much more demoralising effect on the inhabitants of that country than can be produced by an Army hammering vainly on its frontiers, or by a Fleet innocuously blockading its ports, or by a perfectly peaceful Army of Occupation inhabiting an inconsiderable fringe of its territory.

Also, it would seem that this Command of the Air over an enemy country can only be won and held by an Air Force which is under a commander who is absolutely free from interference by any commander of a Fleet or an Army. If the Air Force to whom such a task is committed should be under the Admiral of a Fleet, it would inevitably be diverted to the uses of the Fleet, even under more favourable circumstances than those enshrouding the much-advertised British Navy. Similarly, if it were under the C.-in-C. the Army in the Field, the Air Force, or at any rate a serious part of it, would be diverted by the Army to uses within the theatre of war and the field of battle—that is to say, to the uses of Army strategy and tactics—for it became an axiom in the recent war that the Army could never have enough aircraft.

Thus one is convinced that for offensive operations a separate Air Force is essential to the Armed Forces of any nation.

Air Defence Forces.

When one comes to consider defensive operations one is met with stronger arguments against a Third Service for the Air. The brilliant success of the London Air Defence Area under General Ashmore has proved beyond argument that anti-aircraft defence is a distinct branch of the science of war, and that anti-aircraft defences must be a permanent institution in any country, just as coast defences are to-day.

Coast defences may now be abolished, seeing that half a dozen torpedo-planes can do more against a bombarding fleet than can a dozen coastal batteries of heavy guns. But batteries of anti-aircraft guns, with their accompanying search-lights and balloon aprons, and their co-operating squadrons of aeroplanes, and their specially trained personnel—each man being a specialist in his own line—under a unified and centralised command, are essential to the safety of every country.

The debatable point is whether these anti-aircraft defences should be part and parcel of the Army, or whether they should come under the commander of the Air Force of each country.

It is evident that whatever means are devised for the protection of cities at home against aerial attack will be equally valuable for the protection of ammunition dumps, hospitals, headquarters and other agglomerated institutions with the Army in the Field, and for the protection of the Fleet at sea, whether that Fleet shall consist in the future of obsolete battleships—as does the British Fleet to-day—or of high-speed aircraft-carriers as it will do in the future, if the Lord endows the Admiralty with intelligence. On the face of it, therefore, it would seem that, if only for efficiency in the working of the Adjutant-General's and Quartermaster-General's departments, the anti-aircraft defences should come under the Commander-in-Chief Home Forces. (*Note.*—One is aware that in this country there is a C.-in-C. the Forces in Great Britain and a G.O.C.-in-C. the Forces in Ireland, but one is discussing countries in general.)

But, as in fact neither the Navy nor the Army as such will have anything to do with defending a country against attacks from the air, it would seem permissible to argue that anti-aircraft defences should come under the C.-in-C. Air Forces at Home for operations, administration, and supply. If and when the defending Air Force is defeated in the air and an invading air fleet succeeds in landing considerable forces in a given country, then the Army of that country will come into action against the invaders, but that seems to be another question.

The Invasion of Great Britain.

As regards this country in particular, there are those who ask why we need trouble to prepare defences of any kind, seeing that our only enemies, the Germans, are adequately defeated and disarmed. Even that exceptionally able writer, Mr. Gerard Fiennes, the Navy's strongest defender, seems unable to believe that any other country can invade us by air.

All these writers seem to ignore the obvious war of the future, the great race-war against the Slavs.

We have seen in the recent fracas how the British Navy let us down and allowed the numerically inferior German Navy to acquire a complete command of the Baltic, thus cutting our communications with Russia and preventing us from nipping Bolshevism in the bud. Is it not evident that in the Slav War we shall again lose command of the Baltic?

For our own momentary peace of mind we have destroyed the German Navy, or at any rate we placed the German Fleet in such a position that it was destroyed by its own officers as the only way in which they as loyal servants of their Emperor could retain their honour. Likewise we have destroyed Germany's Air Fleet, the best in the world except our own. And for the pacification of the proletariat, who object to paying for health insurance and war insurance alike, we are rapidly destroying our own Air Fleet.

When the Slav Race combines against us, and brings into operation the Air Fleet which it can build without hindrance from the futile League of Nations in the inner immensities of Russia, there will be nothing, least of all our future friends and allies, the Germans, to prevent the Slavs from taking complete control of the Baltic. The Scandinavian nations are brave, but small. They may defend their fastnesses in the mountains, but they cannot hold their coastal plains. And the South-West corner of Norway is a pre-ordained jumping-off place for the aerial invasion of Great Britain.

Proofs from the Past.

Many months before this war a certain very amiable desperado, one Tryggve Gran, Norwegian sailor, Antarctic explorer, and later Major R.A.F., flew a Blériot with an 80 h.p. Gnôme from Aberdeenshire to Norway. His journey is to the Slav Air Fleet of the future what Louis Blériot's cross-Channel trip of 1909 was to the German aviators of 1915-1918. It is a very simple sum in proportion.

What kind of anti-aircraft defence would be necessary to prevent the landing of an air fleet in the vast open expanses of Aberdeenshire and Fifeshire? Mr. Fiennes remarks sarcastically that aerial invaders will need to carry "inconceivable cargoes of guns, munitions, and supplies." One may remind him that the German Riesenflugzeugen of 1918, which did so much damage to

certain Naval barracks and to certain eminently respectable houses in Maida Vale, carried cargoes of bombs which were "inconceivable" in 1914—except by those few of us who knew how aeroplanes would develop.

And, be it remembered, though Russia has been fairly futile in mechanical matters in this war, Russia none the less produced the first giant aeroplane. And Russia is the one country in the world which is entirely self-supporting in the matter of all the raw material necessary to build and operate an Air Fleet.

The lesson is fairly clear for all who have eyes to see. One has no hopes that these prophecies will have any effect on a blind and foolish people. Nor can one in this case very well hope to live to have the grim satisfaction of saying "I told you so," as one has had in the matter of one's prophecies made before the recent tribe-fight began. But perhaps some of one's very young readers of to-day will pay one the posthumous compliment of digging up these and other various remarks on the Slav War and saying, at any rate, "We were told so."

Our First Line Service.

All of which being so, and things being as they are, it seems very well indeed that the Army should want a hundred squadrons of aeroplanes of its very own, and that the Navy should be agitating internally to take over the sea-going side of the R.A.F. If these desires be gratified, one can see the possibilities of a real Third Service arising, free to concentrate its efforts on becoming the First Line of offence and defence of the British Empire.

With chiefs who are loved and trusted as are the chiefs of the R.A.F. to-day the Royal Air Force may well become worthy of its parent, the British Army. With Sir Hugh Trenchard as Chief of the Staff, with Sir John Salmond as commander of the active service branch, with General (or Commodore, if it be preferred) Longcroft training the rising generation in the tradition of the King's Service, with General (or Commodore) Webb-Bowen setting the Far Eastern units in the right path, with Sir William Salmond organising the forces for over-seas stations, and with other officers tried and trusted as the result of war experience, an Air Force free from the control of or responsibility to the Navy or Army may be built up to do its duty by King and Country.—C. G. G.

The Departure of General Seely.

Post Scriptum.—As this paper goes to press it is announced that General Seely has left the Air Ministry, to go none knows whither. General Seely is an honest man and a fervent of aviation, but he lacks practical common sense. Therefore one feels that his departure brings a step nearer the setting of the King's Flying Services on a proper footing.—C. G. G.

CONCERNING SCANDALS.

Even before the outbreak of the late war the armed Forces of the Crown provided the basis of large argument, and between those who extolled their virtues and those who belaboured their futilities there passed much inconclusive verbiage. Each side separately could produce on paper or in the spoken word apparently conclusive evidence in support of their attitude, and in the absence of a general public knowledge of the actual working conditions of the Army and Navy the side which could appeal most strongly to the prejudices of the British public obtained the larger hearing.

One point was noticeable, and that was the very small proportion amongst the disputants of those who held, or had held, any position of responsibility within the Forces in question.

Since August, 1914, this condition has been modified greatly, and, from Admirals of the Fleet to second lieutenants, persons who have been honoured by the grant of His Majesty's commission have publicly expressed the opinions which their experience within H.M. Services have engendered in their minds.

Within certain limits this is probably all to the good. It tends to remove the discussion of the merits or demerits of the Navy, the Army, and the Air Force, the efficiency of their organisation, the morality of their existence, and such like topics, from that academic sphere which is inhabited almost entirely by impracticable theorists, to a more mundane and useful level.

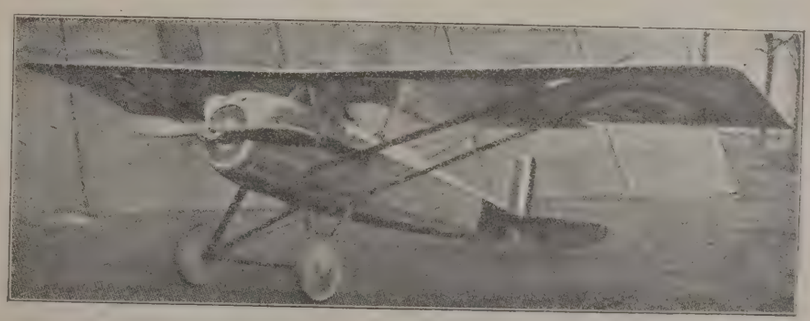
Unfortunately the desirable limits have been widely exceeded.

Salteenas in the Services.

Before the outbreak of war His Majesty's Services were in the main officered by gentlemen, together with a small sprinkling of those who, like Mr. Salteena of "The Young Visiters," were "not quite gentlemen, but you would hardly notice it."

The doctrine was generally firmly held by the former class that, as they were part of the whole, defects and deficiencies within that whole were matters which it was their business to rectify, to the best of their ability, from within, with the least possible publicity.

They were part of the Service; its defects were their defects, its improvement their duty, and its growing efficiency their reward.



Since the war this state of affairs has altered very completely. The number of gentlemen holding His Majesty's commission increased; the number of "Salteenas" similarly honoured increased to an even larger extent; and a very large number of those of whom it could by no manner of means be truly said that "you would hardly notice it" were clothed in a little brief authority and the uniform of an officer.

The leaven of gentlemen no longer sufficed to preserve the accustomed decencies of the Services. Those of the last-named class who found that the habits of the particular arm to which they were appended involved them in inconvenience, loss, or a position of less dignity than that which they felt to be their due showed few hesitancies in exposing their personal grievances to the world at large.

THE GOURDOU-LESEURRE MONOPLANE.

This monoplane is almost entirely constructed of metal. Either an unsprung (as illustrated) or sprung undercarriage can be fitted. Surface, 17 square metres; loading, 42 kilos per square metre; engine, 180 h.p. Hispano-Suiza; speed near ground, 156 m.p.h.; climbs to 15,000 ft. in 17 minutes; officially stated factor of safety, 21.

It has done well in the Deutsch Cup Competition.

Their example has proved too much for the "Salteenas," and even some few amongst these who had escaped detection for years before the war have revealed themselves in their true aspect.

The Attraction of Scandals.

Thus the Press is daily replete with Navy, Army, and Air Force—particularly Air Force—scandals, which very generally appear to have their origin in the disappointed ambitions of the disgruntled.

Sometimes these are frankly an effort to secure recompense for an alleged wrong done to an individual. This type is sufficiently to be deprecated, but it is preferable to the more common type, which bears all the signs of being engineered with the general object of discrediting the Service involved as a means of obtaining satisfaction for its having assessed the authors of the agitation at their true worth.

The efficiency of the Navy, the Army, and the Air Force is a matter of public concern, and the pre-war absence of authentic information as to their condition had many drawbacks.

Had the present state of affairs no other result than to reveal how large a number of the adult male population of these islands are devoid of the instincts of decency, it were sufficiently regrettable, but unfortunately its effects are far wider.

It tends to discredit among the decently minded any honest effort to improve the efficiency of these Forces, and at the same time makes it impossible to appeal to the masses through the daily news-sheets.

A daily column entitled "More W.R.A.F. Scandals" will always draw more readers and influence more votes than will any considered and informed criticism of Air Ministry policy in regard to the organisation and equipment of the R.A.F., and personalities thus become of more practical importance than the efficiency of the Empire's defences.

The Return of Reticence.

A return to the pre-war standard of reticence upon the internal economy of His Majesty's Forces is now impossible, even were it desirable.

A very large proportion, and that generally the more intelligent and decent-minded, of the population of this country has served with those Forces during the war, and will have to so serve again if the next great war arrives as soon as it may.

Most of these people are no longer within the Services, and they are therefore debarred from lending internal silent support to their organisation and efficiency. At the same time it is manifestly to their interest and distinctly their business to secure, by any means in their power, that, if and when the next war does break out, the Forces of this Empire shall be properly organised and equipped, and that the many defects which marked our extemporised fleets and armies shall be remedied ere it is to late.

There is thus all the difference in the world between the making of scandals out of personal grievances and agitations in favour of reforms designed to promote the efficiency of the Royal Air Force, such as those which THE AEROPLANE is wont to father.

The drastic cutting down to which that body is now being subjected must inevitably lead to disappointment on the part of many of its members who find themselves left out of the list of permanent commissions.

It is also a matter for sincere regret on the part of all those who believe in the future of the Air Force and who wish to see it take its proper place amongst the Royal Services as the first line of Imperial Defence.

But it serves no good purpose to attempt to create a disturbance on the ground that A has been demobilised while B, of much inferior attainments, has been granted a permanent commission.

If B happens to have just one rare attainment necessary to the operation of the Force, whereas A does uncommonly well a number of things each one of which can, however, be better done by one other man, A can safely be dispensed with, whereas B cannot. This is unfortunate as far as A is concerned, but the interest of the Force comes first.

Research or Suicide?

It is from this point of view that attention is again drawn to the suicidal action of the Air Ministry towards the research sections of the Technical Department.

The impending doom of Martlesham Heath Testing Station, and the probability of Grain following it, have been noted and protested against already. It appears that the Navigational Experimental Establishment and the Wireless Research Station are to follow—if they have not in fact already been disbanded.

There is no doubt that a very large number of R.A.F. officers will hear of these facts with complete equanimity.

The average pilot will feel that it is but just that technical officers who won the war in their offices be asked to make room for those who risked their necks over the lines.

But the average pilot should take thought to himself and consider just how much he and the others of his kind, without the aid of the despised technical men, could do towards developing serviceable military or naval aircraft and their necessary equipment. Let him consider his own feelings if, at the end of ten years, he were asked to take the air against an up-to-date enemy air fleet, himself mounted on a machine the product of ten years' amateurism.

Militarism versus Commercialism.

Were this country possessed even of a healthy and flourishing Aircraft Industry sufficiently wealthy and enterprising to carry out the experimental work necessary to keep British aircraft design in advance of that of the rest of the world, a strong Technical Research Department attached to the Air Force would still be needed to attend to the purely military side of design and to the armament and equipment of aircraft for military purposes.

This feature of the R.A.F. organisation will become more and more necessary as the peace goes on. During the war aeroplane designers had no aim beyond the production of machines destined for war purposes. With the advent of peace their thoughts have turned to the modification of their designs to adapt them to commercial purposes, and assuming that the peace continues for ten years or so the great majority of designers will by then have entirely forgotten the special needs of military aircraft

Just as to-day they are offering converted war machines for transport work, they will then offer converted cargo-carriers for military purposes, unless the Air Ministry maintains a strong Technical Research Department to attend to the development of military aircraft and its equipment.

At the moment the Air Ministry is doing nothing of the sort. A small nucleus of administrative officers with technical knowledge is apparently to be kept, and quite rightly—but the efforts of this nucleus of a Technical Department to keep in the Service the trained specialist staffs of the actual research establishments is being opposed tooth and nail by the Personnel Department.

The Abandonment of Progress.

Although it were better that the Techuical Department remain as a nucleus of specialist administrators than that it should disappear entirely, the abandonment

of actual research work will very seriously reduce its value.

The experience of the past five years shows conclusively that it is a relatively simple matter to pick men physically and mentally capable of becoming decent pilots, and that converting the raw material into the trained pilot is a fairly quick process.

The experience of the same period indicates that it is very difficult indeed to pick the right class of man to make a really good research officer, and that the organisation of a Government Department is entirely incapable of training men having those qualities with any certainty of success. It is just as essential that a technical officer should consider his Service before his own interests as it is with any other type of officer, but, particularly in the case of officers engaged on test or research work, it is extremely essential that they be men of knowledge, imagination, and of initiative.

Men possessing these latter characteristics are not amenable to discipline in the sense in which it is still understood in H.M. Services. They are not usually prone to refrain from doing that which they think ought to be done merely because in the opinion of their fellows that thing is amongst those "not done."

The Lessons of Discipline.

But one who possesses sufficient knowledge, imagination, and initiative to realise that a breach of discipline almost invariably does much more harm to the Service than any abuse which may be the motive of that breach, and that for the good of the Service he must content himself with such methods of fighting abuses as the customs of the Service provide, is a much more usefully disciplined officer than he who is merely controlled by the prevailing fashions. Good technical officers—in this sense—are rare, and if, as seems probable, the Air Ministry succeed in freezing out most of those who do exist, they will find it by no means easy to replace them.

This type of man does not flourish under official tutelage, and only suffers fools—then not gladly—when he is old enough to realise that they are necessary ingredients of a very mixed world, so that in his earlier years he is not particularly amenable to the kind of training served out at Cadet Schools. Therefore the R.A.F. need not imagine that it can produce the type as needed.

In all probability, when it has successfully demobilised all its capable technical officers, it will find it impossible to replace them at all.

Therefore in the interests of the Service it would be wiser to sacrifice pilots—even the best of pilots—since they are relatively easily manufactured, and to stick to the small number of really capable research officers who do exist—since these are rare and cannot be made to order.—W. H. S.

THE BRITISH AIRCRAFT COMPETITIONS OF 1920.

In connection with the British Aircraft Competitions for prizes amounting to £64,000, the Air Ministry announced on Nov. 10th the following list of engines for use by competitors have been approved by the Air Council. It will be left to the discretion of the judges to decide whether any new engine not included in this list fulfils the conditions of the competition.

A.B.C. (all types), Beardmore (100 h.p.), B.H.P., B.R.1, B.R.2, Cosmos (all types), Galloway Adriatic, Galloway Atlantic, Galloway Pacific, Green (all types), Napier Lion, R.A.F. (all types), Rolls-Royce (all types), Siddeley Puma, Sunbeam (all types), Wolseley Viper.

The competition will be held commencing on the following dates :—

Aeroplanes (small type), March 1st, 1920.
Aeroplanes (large type), May 1st, 1920.
Seaplanes (amphibians), Aug. 1st, 1920

The places at which the competitions will be held will be announced later.

Competitors must enter machines on or before the following dates :—

Aeroplanes (small type), Dec. 31st, 1919.
Aeroplanes (large type), May 1st, 1920.
Seaplanes (amphibians), April 1st, 1920.

The following publications in connection with these competitions will be available for issue towards the end of the month :—

British Aircraft Competitions 1920, Aeroplanes, Conditions and Tests (B.A.C. Form A).

British Aircraft Competitions 1920, Seaplanes (Amphibians), Conditions and Tests (B.A.C. Form B).

British Aircraft Competitions 1920, Notice to Competitors (B.A.C. Form C).

British Aircraft Competitions 1920, Rules and Regulations (B.A.C. Form D).

British Aircraft Competitions 1920, Entry Forms (B.A.C. Form E).

These papers will be obtainable from H.M. Stationery Office or from the Secretary (C.A.L.) Air Ministry.

THE FLIGHT TO AUSTRALIA COMPETITION

A Reuter telegram from Cologne, dated Nov. 3rd, stated :—

Capt. Matthews left the aerodrome at Cologne on Nov. 2nd and came down at Mayence, in the French occupied region. Capt. Matthews refuses to divulge his plans to anyone. He came to Cologne because he could get meteorological reports and information which he could not get in England.

The Blackburn Entry.

Capt. G. H. Wilkins, M.C., is the commanding officer and navigator of the Blackburn "Kangaroo" entered for the flight to Australia competition. He was second in command of the Stefanson Arctic Expedition in 1913-17. After the return of the expedition he was engaged as an Australian Army official photographer in France, Gallipoli, and Palestine. He is now under agreement as Chief of the Scientific Staff of the Cope British Imperial Antarctic Expedition which will leave England in about the middle of 1920.

The first pilot is Lieut. Val. Rendle, who was born in Brisbane. He joined the Queensland Volunteer Flying Corps in 1915 and was commissioned in the R.F.C. in March, 1917.

The second pilot is Lieut. D. R. Williams, who was a ferry pilot and instructor in the Aus.F.C.

Lieut. G. H. Potts is the engineer officer. He was with the Australian G.E.C. of Sydney and served as a gunner officer in the Aus.F.C.

The Australian Blackburn "Kangaroo" has been fitted up to take a crew of four with dual control. The tankage has been increased and the petrol system converted to gravity feed. Rolls-Royce, Ltd., have supplied two specially tuned 275-h.p. Falcon engines fitted with 12-point magnetos and special carburetters

THE GRAIN DINNER.

The dinner of officers and ex-officers of the Marine Aircraft Experimental Depot, Isle of Grain, which was held at the Café Royal Restaurant on Saturday, Nov. 8th last, was an extremely successful affair.

Something over eighty officers and ex-officers of the station were present, and the dinner was presided over by Wing Commander E. Featherstone Briggs, D.S.O., O.B.E. (Commanding Officer, 1917), supported by Wing Commander C. E. Risk, D.S.O., and Wing Commander H. R. Busteed, O.B.E., A.F.C., his predecessor and successor in the command.

Owing perhaps to a breakdown in a Pelmanised memory, the remaining O.C. Grain did not attend.

At the conclusion of dinner, the King having been duly honoured, the past, the present, and the future of Grain were eloquently discussed, described, and forecasted by sundry competent authorities to the entire satisfaction of all present, and it was unanimously decided that the Grain dinner be a recurring annual event.

It appeared to be the general opinion of those competent to judge that the continued existence of the Experimental Depot at Grain was now reasonably assured, but it was felt that, whatever fate befell the establishment, Grain both as a war station and as an experimental depot had made a permanent mark in the history of the naval use of aircraft, and that those who had been associated with its work would never forget it.

In connection with the continuance of this festivity, the secretary of the organising committee, Capt. L. A. T. Pritchard, mentioned that the collection of addresses from ex-members of the Grain staff had in the past presented great difficulties, and asked all present to leave their permanent addresses on their name cards.

If any of those present omitted to fulfil this request, or are in any doubt as to the legibility of the address so left, will they kindly send the information to Captain Pritchard at Wadham College, Oxford, before they have entirely forgotten the matter?

CONGRATULATIONS.

HANDLEY PAGE.—On Nov. 5th, at Lymes Holme, Stanmore, Middlesex, the wife of F. Handley Page, of a daughter.

THE FUTURE OF FLYING DEPENDS ON RELIABILITY

The following is an extract from a leading Article in the DAILY MAIL, *October 9, 1919:—*

"A LANDMARK IN FLIGHT."

Flights scheduled ...	86	Interrupted by weather	1
Flights accomplished...	83	Interrupted by mechanical defect	1
Prevented by weather	1	Number of miles flown ...	20,750

"The above figures, reflecting the opening six weeks' activity of the London-Paris Air Express Service, need little elaboration. Reliability in the air has been achieved.

"At 12.30 p.m. each day from Paris and from London, the London-Paris Air-pilots have started off more punctually than many a train. They have averaged 106 miles an hour and covered the 250 miles systematically in 2¼ hours. The machines are a peace offshoot of the famous de Havilland bombers and the pilots—an all-important factor—are the cream of the R.A.F. Business men have booked up the service for a month ahead. The Company is aiming at an hourly schedule, but we believe its main immediate success will be in carrying mails at a speed by which it will be possible to get a reply, by tea-time, to a letter airmailed to Paris after breakfast.

"Reliability must be guaranteed the public. That it is so guaranteed emerges forcibly if we consider that the London-Paris stretch is the worst in the whole world for rapid weather changes, and that in the six weeks above tabulated only eight days were officially reported as 'favourable for flying.'"

ROLLS-ROYCE ENGINES, WITH FEW EXCEPTIONS, ARE USED ON ALL THE MACHINES OF THE LONDON — PARIS AIR EXPRESS SERVICE.

THE FIRST DIRECT ATLANTIC FLIGHT WAS ACCOMPLISHED WITH ROLLS-ROYCE ENGINES IN A VICKERS (VIMY) AEROPLANE

We are exhibiting at Olympia, November 7-15, 1919. Stand No. 74.

ROLLS-ROYCE LIMITED

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, Nov. 10th.

The President of the French Republic, accompanied by Madame Poincaré, arrived in London this afternoon on a visit to the King and Queen at Buckingham Palace.

The Prince Albert, attended by Major Louis Greig, received the President on his arrival at Dover, on behalf of the King.

The President and Madame Poincaré, accompanied by the Prince Albert, travelled by special train on the South Eastern and Chatham Railway to Victoria Station.

The King and Queen met the President and Madame Poincaré on arrival.

There were also present at the station: Representatives of the Royal Navy, the Army, and the Royal Air Force.

In the evening the King and Queen gave a banquet in honour of the President, who was accompanied by Madame Poincaré, at which the Prince Albert was present, and the following had the honour of being invited: The Right Hon. Winston Spencer Churchill, M.P. (Secretary of State for War and Air), and Mrs. Churchill, Air-Marshal Sir Hugh Trenchard, Bt. (Chief of the Air Staff).

NAVAL.

LIGHTER-THAN-AIR CRAFT.

As from Wednesday, Oct. 22nd, the airship service, with its stations, machinery, plant, and stores, was transferred from the Admiralty to the Air Ministry. This state of affairs has been threatened for some time past, the Government having decided during the summer to make the transfer. As airships are essential to a fleet at war, it was a foregone conclusion that such a purely naval affair as the airship service should be transferred to the R.A.F.

H.M.S. "ENGADINE."

His Majesty's Seaplane-carrier "Engadine" has arrived at Sheerness from the Mediterranean. She will be paid off at Chatham and refitted for commercial use.

H.M.S. "Engadine" is the most famous of the three cross-Channel steamers requisitioned by the Admiralty as seaplane-carriers at the beginning of the war. She took part in the air raid on Cuxhavn and Wilhelmshavn on Christmas Day, 1914, and was, one believes, the flagship of the three seaplane-carriers. In the much-disputed Jutland battle "Engadine" took part and gained a mention in dispatches therefor. She it was who sent up the only seaplane that took part in the battle, and to "Engadine" fell the honour of towing the disabled "Warrior" out of danger. Since that time she has been on active service in the Mediterranean, including, during the last few months, service against the Russian Bolshevists in the Crimea.

THE NAVAL WARRANT OFFICER AND THE R.A.F.

The formation of a new Service from sections of the two original Services in His Majesty's Armed Forces necessarily causes hardship to some of the personnel whose transfer is necessary if success is desired. But it is possible in most cases to remedy the genuine grievances by the drafting of special regulations to remove the anomalies which must arise from the sudden mixing of naval and military personnel.

The Naval Warrant Officers who have transferred from the Royal Navy to the Royal Air Force have in many cases suffered disabilities which could be removed by a small re-adjustment in the regulations governing these matters. There can be no recurrence of these cases as they all arise from the formation of the new Force. Future transfers will follow normal lines, and those who desire to be transferred must naturally abide by the consequences. Regulations will be in existence and will have stood the test of time. At present they are drafted as the occasion arises and there consequently is a high degree of incoherence.

To quote one case, there is an R.A.F. officer who in 1910 joined the Navy on a twelve years' agreement. Two years later he volunteered for service in the R.N.A.S. and became a Rigger, which he continued to be until the end of 1914. Early in 1915 he went to France, where he remained throughout the war. In 1917 he was promoted Warrant Officer 2nd Class. On the famous April 1st, 1918, he was transferred, in common with others, to the R.A.F. as a 2nd Lieut. (Technical) and became at a later date Lieut. (Acting). He applied for a regular commission but so far has not received one.

He has left the Navy and has thereby forfeited his chances of a pension. Unless he receives a permanent commission his Service life (in common with that of several dozen officers serving under exactly similar conditions) is over. His conduct has been excellent and his efficiency is unquestioned. Should not something be done to give this officer an opportunity of continuing in the Service for which he has so sincere a regard? If he is to return to the Navy—supposing that the Navy would agree to his return—his reversion from commissioned to warrant rank would be a quite unsuitable punishment for a constant adherence to the highest ideal of duty.

Would it not be well to stretch the rules and ordinances of the Personnel Department to the uttermost limit and so admit all the efficient promoted Warrant Officers to the permanent establishment of the Royal Air Force?

MILITARY.

ANOTHER WAR?

Owing to continued hostility on the part of the Waziris and Mahsuds in Afghanistan the Government of India has been forced to consider the adoption of punitive measures. The representatives of the tribes have been summoned to meet the Government to discuss the matter. As they refuse to appear and the Government's terms were refused, the tribes were given time to remove their women and children to a place of safety, when the country was subjected to an intense bombardment from the air. One questions the advisability of removing the women and children. According to certain frontier stories, the Afghan women can hold their own when it comes to atrocities.

Major-Gen. Climo, who took part in the recent Afghan campaign, will command the British forces, and many aeroplanes will be placed at his disposal besides the usual force of artillery, cavalry and infantry.

The aerial operations against the above-mentioned tribes began on Oct. 28th, when Wana was attacked by three De Havilland machines from Mainwali, and some 2,000 lb of bombs was dropped. A number of incendiary bombs was included in the equipment of the machines, and hits were observed. All the machines returned. A reconnaissance raid had been previously made on Oct. 25th, and according to one account nine bombs were dropped upon that occasion.

The tribesmen appear to have been duly impressed by the bombing of Wana, and quite a good deal of damage has been done.

A WHITE PAPER.

The following accusation is contained in the White Paper issued by the India Office on Nov. 5th. The White Paper deals principally with the supply of medical stores, etc., to the British force during the last Afghan war:—

"The arrival of squadrons of the R.A.F. without machines (there were no ships to carry the machines) had nothing to do with Indian arrangements nor the Secretary of State. It is for Air Ministry to fix the responsibility.

"As regards the obsolete machines of the squadrons in India on the outbreak of war, the General Officer Commanding, Royal Air Force, cabled to the Air Ministry on Jan. 23rd, 1919, and Feb. 25th, 1919, for their replacement by 'Bristol' fighters."

AIR FORCE.

DECORATIONS AND MORNING DRESS.

The following notice appears in the "London Gazette" of Oct. 31st:—

All members of the various Orders of Knighthood, etc., and all persons who have been awarded decorations and medals may, should they wish to do so, wear their Insigna, decorations, and medals with morning dress on official occasions and at public functions.

The ribbons of the Orders, decorations, and medals may be worn on all occasions at the discretion of the holder.

The method of wearing the Insignia of Orders, also decorations and medals, on official occasions and at public functions with morning dress is as follows:—

Knights Grand Cross, Knights Grand Commanders, Dames Grand Cross, Knights Commanders, and Dames Commanders

Should wear the Star only on the left breast of the coat or in a corresponding place on the dress, as the case may be.

Members of the Order of Merit, men who are Members of the Order of the Companions of Honour, Companions of the

several Orders of Knighthood, Commanders of the Royal Victorian Order, and men who are Commanders of the Order of the British Empire

Should wear the ribbon to which the badge is suspended under the tie, which should be a bow, the badge hanging about three-quarters of an inch below the bow.

Women who are Members of the Order of the Companions of Honour, Companions of the Distinguished Service Order, Officers of the Order of the British Empire, Members of the 4th and 5th Classes of the Royal Victorian Order, Members of the Order of the British Empire, persons who have been decorated with the Victoria Cross, the Royal Red Cross, the Distinguished Service Cross, the Military Cross, the Distinguished Flying Cross, the Air Force Cross, and persons who have been awarded medals

Should wear the badges, decorations, and medals on the left breast of the coat, or in a corresponding place on the dress as the case may be.

The method of wearing the ribbons of Orders, decorations, and medals, which will be the same in all cases, both for men and women, is as follows :—

A piece of the ribbon one and a half inches wide, or the width of the medal ribbon and half an inch in depth, mounted on a bar of metal in the form of a brooch, to be worn on the left breast of the coat, or in a corresponding place on the dress, as the case may be.

NOTE.—The above intimation only refers to morning dress.

PRESENTATION AEROPLANES.

On Saturday, Nov. 8th, the city of Birmingham presented an aeroplane to the Dominion of South Africa. This was Birmingham's contribution to the Imperial Air Fleet. The presentation took place at the Castle Bromwich Aerodrome, and among those present were Lord Desborough, the president of the Imperial Air Fleet Committee; Major-Gen. Sir F. H. Sykes, G.B.E., K.C.B., C.M.G.; and Air Commodore E. M. Maitland, C.M.G., D.S.O., A.F.C. During the ceremony a medallion was presented by the Hon. R. A. Blankenburg to Capt. Pott, D.S.O., a South African, for services rendered in the destruction of a Zeppelin off Hartlepool in 1916.

BOY RECRUITS FOR THE R.A.F.

The Air Council has asked the various education authorities to assist in recruiting boy learners for the R.A.F. The local education authorities nominate candidates on the grounds of educational attainments and general suitability, the idea being that boys of good education will thus be taught a trade and in time become skilled craftsmen.

Boys between the ages of fifteen and sixteen undergo three years' training in one or other of the skilled trades required in the R.A.F. and also receive a good general education, and at eighteen enter the R.A.F. for a further period of eight years. The syllabus for examination will be mathematics, English, history and geography, science, drawing. The first examinations are to be held in December with a view to the selection of seven hundred and fifty boys.

The scheme provides good prospects, for boys of character and ability, of early advancement to commissioned rank. And those who are not so fortunate will at least have the satisfaction of knowing that when their period of service is over they are skilled workers and able to earn their living in civil life.

RUGBY FOOTBALL.

On Saturday, Nov. 8th, the R.A.F. played Northampton with the following result :—R.A.F., 1 penalty goal—3 points; Northampton, 3 goals 2 tries—21 points.

This game opened at an exceedingly fast pace, and for the first twenty minutes very interesting play took place, the ball being at one end one moment and the other end the next, neither side gaining an advantage. The R.A.F. scored first, but Northampton immediately afterwards obtained a try, which was converted. The half-time score was 10—3.

In the second half Northampton crossed the R.A.F. line three times, while the R.A.F. did not score at all, although some excellent openings were made, and if the team had been together and in practice a score could hardly have failed to have been made more than once.

The R.A.F. forwards were excellent, especially in the loose, and for the three-quarters Flt. Lt. Thomas did some very fine saving and defence kicking. The R.A.F. especially want one or two fast and speedy wings. Northampton were unlucky in having three of their team crocked in the latter part of the game.

R.A.F. team :—Full-back, Flying Officer Damant; three-quarters, Wing Comdr. Playfair (left wing), Sqdn. Leader Neale, Flt. Lt. Thomas, and Flying Officer Smith (right wing); half-backs, Sqdn. Leader Smart and Sqdn. Leader Pulford; forwards, Flt. Lt. Wakefield, Flt. Lt. Simpson, Flt. Lt. Munday, Flt. Lt. Scroggs, Flt. Lt. Drew, Flying Officer Rose, Flying Officer Abbot, and Serjt. Smith.—W. W. W.

At Weybridge, Nov. 8th : No. 2 New Zealand General Hospital, Walton-on-Thames, 22 points; R.A.F. (Uxbridge), 3 points.—J. F. S.

AN APPEAL AND THE NEXT MATCH.

Will players and people interested in R.A.F. Rugby football please inform W. W. Wakefield, R.A.F. Depot, Uxbridge, the hon. sec., of any useful players of whom they may know?

The next match is at the Athletic Ground, Richmond, on Wednesday, Nov. 26th, against the United Services. Kick-off 2.45 p.m.

THE R.A.F. ARMAMENT SCHOOL DINNER.

All officers of the old Staff are invited to a Re-union on Dec. 5th, at the Connaught Rooms, Great Queen Street, Kingsway. Assemble 19.00; Dinner 19.30. Tickets £2 each are obtainable up to Dec. 1st from Major G. E. Smith, 10, Chevening Road, Brondesbury, N.W.6.

WANTED : A HOME.

Now that the various squadrons of the R.A.F. are settling down into something like permanent habitations, the squadron mascot habit is likely to become a permanent institution.

If any squadron wants a squadron pet with a history one can recommend it to apply to Mr. W. H. McCudden for the bull-dog "Bruiser," which was the property of the late Major J. T. B. McCudden, V.C., D.S.O., M.C., M.M., Croix de Guerre. "Bruiser" is rather big for a household pet but would make an excellent member of a squadron mess, and Mr. McCudden would rather that he remained in the R.A.F. than that he should become a mere civilian permanently.

Any squadron who would like to adopt "Bruiser" is invited to write to Mr. McCudden, c/o this office.

IRELAND.

It is understood from Irish sources that the Air Ministry has decided on establishing the headquarters of the Royal Air Force in the east of Ireland, at Gormanston, where an aerodrome was established during the war, and which still remains intact, with a number of very fine hangars and an abundance of workshops.

The Tallaght aerodrome is being closed down, sales of surplus stock are announced, and stores from that aerodrome and from Baldonnell will be removed to Gormanston, which is fifteen miles from Dublin.

The Gormanston aerodrome is free from surface water, as is a great deal of the neighbouring country, which is therefore very suitable for landing grounds. It is believed in the district that a passenger service will be started next year from England to Ireland, and that an aerodrome will be established in the vicinity of Gormanston.

FRANCE.

THE SAINT RAPHAEL-CASABLANCA FLIGHT.

The escadrille of flying-boats which has been waiting for some time to fly from Saint Raphael to Casablanca left the former place on Nov. 1st. Six started, but two returned later in the day owing to engine failure. Two of the remaining four reached Saint Sitges, 13 miles from Tarragona, and the last two Rosas on the same day.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

WAR PRODUCTION.

The following war figures are of interest. Italian works turned out 14,820 aero engines during the period 1915-18, half of these being Fiats, of which 4,000 were exchanged to the Allies for other useful wares. Some 500 or 600 were produced by several smaller firms—the Chiribiri, for instance, who just exceeded the latter figure, and the Ansaldo.

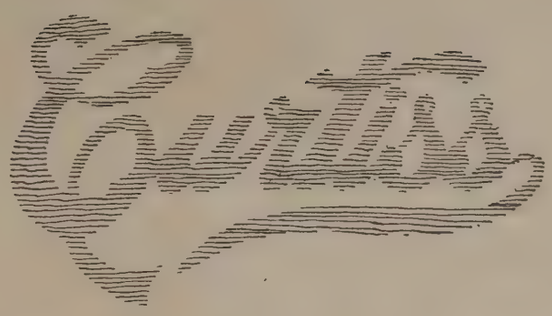
Towards the end of the war the price of 600 h.p. Capronis was advanced to 98,200 lire from about 75,000. The triplanes with bigger engines were, it has been stated, paid a rough 500,000 lire, not having reached the quantity production stage evidently at that period.

THE ROME-TOKIO FLIGHT.

Fiume reports that the wicked local Bora wind has destroyed a number of the aeroplanes pegged down there in want of sheds. Two of the Tokio flight machines are also *hors de combat* from the same cause. There still appears some likelihood of the Rome-Tokio coming on.

NEWS FROM ROME.

From Rome I learn that Col. La Polla, O.C. the Baracca aerodrome, was to stand for Parliament.



THE ENGINES OF T.34.

The six 500 h.p. San Giorgio motors of the new T.34 dirigible are of the Austro-Daimler type—as captured on a K. seaplane—built by Ansaldo.—T. S. H.

JAPAN.

THE AERIAL ARMS IN JAPAN.

The Army has in its possession several aeroplanes of European designs and construction. A Sopwith model and the

FLYING BOATS; AERONAUTICAL MOTORS
AEROPLANES; HYDRO-AEROPLANES.

THE CURTISS AEROPLANE AND MOTOR CORPORATION AND ITS AFFILIATED COMPANIES HAS ALWAYS BEEN THE DOMINATING CENTRE OF AVIATION IN AMERICA. ITS CAPACITY HAS STEADILY GROWN UNTIL TO-DAY IT IS THE LARGEST AND BEST EQUIPPED AEROPLANE MANUFACTURING CORPORATION IN THE WORLD, AMPLY PROVIDED WITH ALL FACILITIES FOR BUILDING A LARGE VARIETY OF TYPES OF AEROPLANES, HYDRO-AEROPLANES, FLYING-BOATS, AND AERONAUTICAL MOTORS.

IN *LARGE QUANTITIES* AND FOR *PROMPT DELIVERY*.

SALES OFFICES: New York City and Garden City, N.Y. Factories and Flying Fields: Buffalo, Atlantic City, Hammondsport, Newport, Newport News, Miami. Curtiss Engineering Corporation: Garden City, Long Island; The Burgess Company, Marblehead, Mass.

Member Manufacturers' Aircraft Association

Farman E.40 are allocated to bombing work. The Nieuport and the Sopwith "Camel" are classed as fighting machines. Other aeroplanes in the possession of the Japanese Government are the Salmson, Spad, and Standard—presumably the latter is American in origin.

The Navy has one base at Yokusuka for seaplanes and aeroplanes.

An airship station is in existence at Toksuka, where a hangar of 400 ft. in length is in course of construction. Two airships of 124,000 cub. ft. capacity are on order from Vickers, Ltd.

The French aviation mission has opened a flying school at Gifu and two depots for bomb-dropping and observation training at Nogoya.

SPAIN.

Mr. F. P. Raynham, who recently took an F.4 Martinsyde two-seater, 300 h.p. Hispano-Suiza, to Spain, has been doing some exceedingly demonstrative work there. He has taken up a number of officers of the Spanish Royal Flying Corps, and all have been greatly impressed by the speed and climbing quality of the machine.

Recently he has been demonstrating the F.4 as a bomber. With a 315 lb. bomb she climbed to 1,750 metres in 5½ min. The merit of this performance is enhanced by the fact that the aerodrome of Cuatro-Vientos is itself at an altitude of 750 metres above the sea, and the performance is equal to climbing from that height to 2,500 metres in 5½ min., which, of course, is considerably better than climbing from sea-level to 1,750 metres in the same time. Considering that the machine was originally designed as a single-seater fighter, its performance as a bomber is quite extraordinary.

A Madrid-Tetuan Flight.

On Oct. 29th a cavalry lieutenant on a Breguet biplane flew from Madrid to Tetuan in 3 hours 30 min.

Three Breguet Biplanes for the Spanish Army.

Three Breguet bombing biplanes were delivered at Madrid towards the end of October by MM. Massot, Walbaum, and de Romanet, who had flown them from Paris.

SWEDEN.

The Danish correspondent of The Aeroplane writes :—

The Italian Naval Attaché at Stockholm has on behalf of his Government presented Sweden with a 260 h.p. Savoia and an 80 h.p. Macchi flying-boats.

It will be remembered that the Italian Lieut. Count Robinet recently continued his transcontinental river flight from Italy to Holland on to Copenhagen and Stockholm, from where he returned to Holland to lead some more Italian Naval aircraft, staying there, on a Scandinavian circuit. So the presented specimens are likely out of a squadron of four, which reached the Swedish capital via Esbjerg and Gothenburg, where they were arrested for landing too near a fortress, Count Robinet having his flying-boat damaged at the Swedish capital from flying into some telegraph wires and losing speed, repairs yet being carried out at the Royal Dockyard there.

U.S.A.

An American aerial squadron is said to be going to visit Brazil at the beginning of next year.

The Late Col. T. F. Dodd.

The death is announced from New York of Col. Townsend Dodd, U.S. Signal Service (Air Service), in an aeroplane accident at Bustleton, Pennsylvania, on Oct. 5th, 1919.

Born in 1886, he entered the Coast Artillery Corps as a lieutenant after two years as an engineer in the Civil Service in the Navy Department. He was already a B.Sc. of the University of Illinois.

On May 9th, 1913, he was posted to the First Aero Squadron, Signal Corps, at Texas City, and qualified as an aviator on Dec. 30th, 1913. Promoted captain on Sept. 8th, 1915, he took over command of a detachment, First Aero Squadron, at Brownsville, Texas. His intimate knowledge of engineering and his personal high ability made his opinion of considerable value to the Chief Signal Officer, who frequently consulted him. The University of Illinois having asked for his services as an instructor at an aviation school attached to that institution, the Chief Signal Officer replied that his services could not be spared, as he was then holding with credit the appointment of Department Aviation Officer, Southern Department, with the rank of major.

During the fracas with Mexico in 1916 he commanded the First Aero Squadron in the Punitive Expedition, and his experiences of aviation in that strange country with the strange machines then available make an instructive and amusing story.

In the summer of 1917 he went to France with the American Expeditionary Force, and was attached to General Pershing's staff as Air Service Officer. He did excellent work in the purchase of aircraft equipment and as a member of the Joint Army and Navy Aircraft Committee of the Aircraft Production Board.

While passing through England on his way to France, Major Dodd, as he then was, took the chair at that memorable Wilbur Wright Memorial Lecture delivered by Lieut.-Col. Mervyn O'Gorman. His speech on that occasion impressed everybody by its sound common-sense, and his charm of manner gave an excellent impression of the high quality of the aviation staff of the United States Army.

Promoted Lieut.-Col. on Aug. 5th, 1917, he became Colonel on Sept. 9th, 1918, and when Brig.-Gen. Mitchell became G.O.C. Air Service, Group of Armies, Col. Dodd was appointed to be his Chief of Staff.

In December, 1918, he was recommended for the award of the Distinguished Service Medal. Gen. Mitchell's minute in this matter concluded with the words: "Col. Dodd has been untiring in his devotion, and there is no officer with the A.S. who possesses a more complete technical knowledge of airplanes or is more familiar with the history of aviation in France, in which he has played so great a part."

On Nov. 14th, 1918, Col. Dodd was appointed Chief of the Air Service with the 3rd Army, but was unable to take up the appointment owing to a nervous collapse. After his recovery he was posted in January, 1919, to be in charge of the Paris Office of the Chief of the Air Service, American Expeditionary Force. Later he returned to the United States of America, where he was employed in the Office of the Director of Military Aeronautics, until in July last he took over command of Langley Field, Hampton, Virginia. When flying, on October 5th, from that place to Mineola, New York, he was killed.

Those who had the privilege of meeting Col. Dodd during his brief visit to this country deeply regret his death and offer their sympathy to his brother-officers and to his relatives.

Demobilisation in the U.S. Air Services.

The following figures are extracted from the U.S. "Air Service News Letter," dated Oct. 18th, 1919. The number and ranks of officers demobilised between Nov. 11th, 1918, and Sept. 13th, 1919, are shown :—

The American View.

On Oct. 27th Senator Wadsworth, Chairman of the Military Affairs Committee of the Senate asked for a separate Air Service to raise U.S. Service aviation out of the position into which it has fallen since the Armistice.

At the same time he protested against the refusal of an appropriation of £3,000,000 demanded for Military aeronautics. He pointed out how far the United States had fallen behind France and England, both of which countries had recognised the commercial value of aviation.

An Army and Navy Balloon Race.

The following account of a Naval and Military balloon race is extracted from the U.S. "Air Service News Letter" dated Oct. 8th, 1919 :—

A Free Balloon Race between representatives of the Army and the Navy under the auspices of the Missouri Aeronautical Society was held on Sept. 26th, 1919, starting from St. Louis, Mo. Three balloons were entered representing the Army and three representing the Navy, each of 50,000 cubic feet capacity, using coal gas and each carrying one officer as pilot and one as aid. The object was to cover the greatest distance in any direction from St. Louis, and time was not a factor in the contest. Of the Navy balloons, one was unable to leave the park, owing to a leaking bag; one landed at Menon, Mich.; and the other, piloted by Lieut. Emerson, landed at Stittsville, Mich. Of the Army balloons, one was forced to land in the heart of St. Louis, after 20 minutes' flight; another landed at Green Bay, Wis.; and the third, piloted by Capt. E. P. Phillips with Lieut. B. T. Burt as aid, landed in the waters of Lake Michigan off Death's Door Bluff just north of Door Peninsula. The agreement was that in such an event the point on the shore line crossed just before reaching the water was to be taken as the end of the race, so that the farthest point credited to the Army balloon is the northernmost tip of Door Peninsula, and it appears from the incomplete information at hand that the result is practically a tie between Lieut. Emerson, of the Navy, and Capt. Phillips and Lieut. Burt, of the Army. The officials of the Coast and Geodetic Survey are computing the exact distance and to date the official announcement of the winner has not been made.

It is understood that all of the landings were without incident, except in the case of the Langley Field Pilot, Capt. Phillips and Lieut. Burt, whose landing presented a very narrow escape from drowning.

AIRCRAFT IN PARLIAMENT

HOUSE OF COMMONS.

The following written answers were given on November 3rd :—

ROYAL AIR FORCE—PERMANENT BUILDINGS.

Major-Gen. SEELY, the Under Secretary of State to the Air Ministry, in reply to Rear-Admiral Adair, said: It will be necessary to erect permanent buildings in substitution for hutting or temporary buildings at such air stations as are retained for the after-war Air Force. The number of stations so to be maintained is now under consideration, and I cannot, therefore, give the estimated cost at present.

CIVILIAN DISCHARGES.

Major-Gen. SEELY, replying to Mr. A. Short, said that the answers to the following questions were in the affirmative: That 1,433 civilians at present employed at No. 1 stores depôt, Kidbrooke, are to be reduced to 450 by the end of the year, and that the total number of between 6,000 and 7,000 employed by the Royal Air Force is to be reduced to 3,480 by the end of the year:

"In order to afford the men discharged better opportunities of obtaining employment, the desirability of spreading the discharges over as long a period as possible has already received very careful consideration. I have received two deputations on the matter and have discussed the situation fully with representatives of the men concerned. As a result the period has been appreciably lengthened. I much regret the hardship caused, but it is impossible to still further delay the discharges, in view of the very large reduction in the Air Force. The closest touch is maintained by the Air Ministry with the Ministry of Labour, and advanced information is given of impending discharges."

* * *

The following oral answers were given on Nov. 4th :—

LEAGUE OF OFFICERS.

Lieut.-Col. Sir FREDERICK HALL asked the Secretary for War if a considerable number of officers of the Royal Air Force who volunteered for service in Russia were sent out at short notice and without even the usual embarkation leave; if it was understood that they would be given leave privileges when opportunity occurred to make up for this; and if now on their return these officers, who in many cases have served long periods in the trying Russian campaign without any leave, are being demobilised and struck off the pay-sheets on their arrival back in this country.

Mr. PARKER (Lord of the Treasury): I have been asked to take this question. The reply to the first part is that owing to the urgency of the demands many officers were sent out at short notice, very few, if any, went without a few days' leave. To the second part, that no communication to the effect mentioned was made by the authority of the Air Ministry. The answer to the third part of my hon. and gallant friend's question is that all officers returning from Russia who had not been recommended for permanent or short-service commissions were informed that their demobilisation must be carried out as soon as they returned to this country; that the question of leave for service in Russia was being dealt with; and that if it was decided they were eligible for leave their demobilisation would be post-dated for the period sanctioned in order to enable them to draw pay for that period. Since then it has been decided to grant fourteen days' leave for each six months' service in Russia, and action is being taken to post-date the demobilisation of officers entitled to leave under this ruling. No leave is admissible for service of less than six months in Russia.

Sir F. HALL: May I ask the Secretary of State for the Air Department whether he is aware that in reply to a supplementary question a few days ago he informed me that these officers had not been summarily discharged, and that leave had been granted; and can he say whether if any of these officers have been discharged on their arrival in this country and have not had proper leave, he will take steps to see that in lieu of leave, since they are demobilised, they are paid for that period?

Mr. CHURCHILL: I will inquire into the matter. Certainly they should have their proper leave.

Sir F. HALL: Or pay in lieu of leave?

Colonel YATE: What is their proper leave? Is it not fair that an officer on demobilisation should be given twenty-eight days' grace the same as the men?

Mr. CHURCHILL: I will not say. I should like to refresh my memory.

The following written answers were given on Nov. 4th :—

SENIOR OFFICERS.

Major WARING asked the Under Secretary of State to the Air Ministry whether there are in command of the Air Force one marshal of the air and five air vice-marshals; if so, will he state what work can be found to keep these officers employed; and whether the command organisation and administration could be performed efficiently by fewer officers of high rank.

Major-Gen. SEELY: The reply to the first part of my hon. and gallant friend's question is that there is no marshal of the air at the present time, but that there are one Air Marshal and five Air Vice-Marshals, corresponding to one Lieut.-General and five Major-Generals. These officers are fully employed, and I do not consider that this small number of senior officers is excessive for so vitally important a service.

TRAINING AND STAFF—EGYPT

Major WARING asked the Under Secretary of State to the Air Ministry whether it is the intention to recommence flying training in Egypt; and, if not, what reduction it is proposed to make in the administrative staffs and units in that country, in view of the fact that only five active flying squadrons are now employed in that command.

Major-Gen. SEELY: It is hoped to recommence flying training in Egypt, but a final decision cannot be taken until the strength and constitution of the after-war Air Force is settled. The administrative staff was reduced early this year to what is considered necessary to deal with the units under the command of the Air Officer Commanding, Middle East, of which command Egypt forms a part.

AERODROMES (SHERBURN-IN-ELMET AND TADCASTER).

Major-Gen. SEELY, replying to Major Lane-Fox, said: Both these aerodromes are being used for the storage of standard-type machines and for civil aviation. Other accommodation is not at present available for the storage of these valuable machines, which would deteriorate is not constantly attended to. Tadcaster is also the station of a headquarters unit. Instructions have been given to close down both stations when cleared of stores. Sherburn-in-Elmet will, it is expected, be cleared by March 31st next and Tadcaster by the end of this year. When evacuated by the Royal Air Force both stations will be handed over to the Disposal Board for sale.

* * *

The following oral answer was given on Nov. 5th :—

UXBRIDGE ARMAMENT SCHOOL.

Major-Gen. SEELY, the Under Secretary of State for Air, in reply to Mr. Preston, said: There is no longer any armament school at Uxbridge. If my hon. friend is referring to the Royal Air Force depot at Uxbridge, the personnel on the strength of this depot (which comprises Headquarters, Southern Area, and Headquarters, No. 2 Group) is as follows:—Royal Air Force, officers, 93; airmen, 1,881 (of whom 1,561 are recruits); Women's Royal Air Force, 89 (of whom 49 are in course of being demobilised); civilian subordinates, 33; total, 2,096. It is intended that this shall be a permanent depot.

* * *

The following written answers were given on Nov. 5th :—

FERMOY CAMP.

Major-Gen. SEELY, replying to a question asked by Mr. Grundy, whether he was aware that 106th Squadron, mostly composed of young lads, is still under canvas at Fermoy, county Cork, with only boards to sleep on and a blanket covering, said: No. 106 Squadron was disbanded on October 8th last. However, regarding the detached flight of No. 105 Squadron now stationed at Fermoy, arrangements were made some weeks ago to accommodate this flight in buildings lent by the Army.

GRATUITIES (DEDUCTIONS FOR DEBT).

Major-Gen. SEELY, replying to Mr. Hogge, said: The Order granting war gratuities to airmen provides that, except in the case of airmen serving on a normal Service engagement, the gratuities shall be held liable to meet any public claim, Service debt, or Service claim.

AIRSHIP SHED, EAST FORTUNE.

Lieut.-Col. Sir JOHN HOPE asked the Under Secretary of State to the Air Ministry whether the steel airship shed constructed at East Fortune for R.34, at a cost of £250,000 is to be moved to Howden, or how this shed and five smaller airship sheds at East Fortune are to be disposed of.

Major-Gen. SEELY: It is not the intention to move to Howden Airship Station the rigid airship shed at East Fortune in which the R.34 is at present housed, and to which I assume my hon. and gallant friend refers. The cost of this shed was £160,000. This shed and the other two (not five) small airship sheds on the station, if not required for the purposes of civil aviation, are to be handed over to the Disposal Board.

STATIONS (RETENTION).

Major-Gen. SEELY, replying to Sir J. Hope, said: The retention of certain air stations has been decided upon and in the case of certain other stations a decision is awaiting the final settlement of the peace basis of the Royal Air Force. Construction work has been stopped on all stations other than those which it is definitely intended to retain, except in cases where a small amount of work has been necessary for the safety and preservation of buildings partially completed.

* * *

The following oral answers were given on Nov. 6th :—

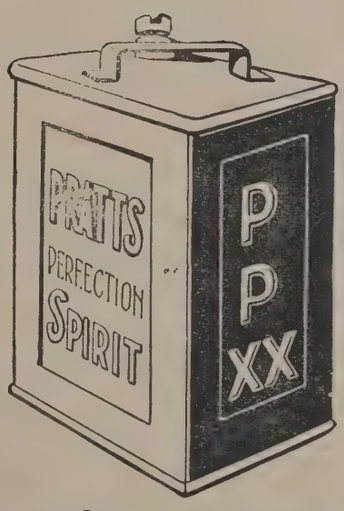
THE UNDER SECRETARY OF STATE FOR AIR (Major-Gen. Seely), replying to Major Glyn, said: There have been surrendered by the Royal Air Force since the Armistice :—

(a) Stations consisting of land only (i.e., landing grounds and camping grounds), 124.
(b) Stations consisting of land and buildings (including ten transferred to other Departments), 122.
(c) Stations at which aerodromes have been released, whilst buildings are still required for Royal Air Force purposes, 6.

Arrangements are being made whereby civilian caretakers will, pending the sale of buildings, be placed in charge of stations cleared of Royal Air Force material, vacated by Royal Air Force personnel and handed over for disposal. In some cases Royal Air Force personnel remain in charge pending the appointment of civilian caretakers and in a few other cases the local police have been requested to exercise supervision over empty buildings.

It is a fact that when the Disposal Board are unable to take over stores the Royal Air Force personnel has to be retained to look after them, and that of course adds to the charge on the R.A.F., but the matter is now being finally considered, and I hope we shall avoid any delay in the future.

Major-Gen. SEELY, replying to Mr. Billing, said: The question as to which is the more costly is a very elaborate calculation between the R.A.F. and the civilian control, but there is obviously an advantage in handing it over to the civilian personnel in order that the small R.A.F. personnel retained may be engaged in their proper duties.



You may have to wait a considerable time for delivery of your new car —the best for your purpose

But you will not have to wait for delivery of "PERFECTION" SPIRIT —it's available everywhere—and the best for your purpose

they all run best on Pratt's

GREAT BRITAIN.

The Aerial Mail Fiasco.

The first regular international air mail service in the world should have begun on Nov. 10th between London and Paris. The first regular air mail service in the world started in America over a year ago and has been flourishing ever since, but that is not an international service. Nor was the service carried out by the R.A.F. between Lympne and Cologne an international service, as the letters were only taken to and from the British Army and R.A.F. in occupation in Germany. Mails were carried from London to Paris by air during the late railway strike in this country, but that was no regular service.

The following announcement was made by the Post Office on Nov. 6th :—

The Postmaster-General has made arrangements for the establishment of an air mail service between London and Paris. The service will extend to Paris, France generally, Italy, Spain, Switzerland, etc., and will begin on Monday (Nov. 10th).

Registered and unregistered letters, postcards, packets of printed papers and commercial papers, and samples will be accepted for transmission. Parcels and insured correspondence will not be accepted. A special fee at the rate of 2s. 6d. per oz. will be charged in addition to the ordinary foreign postage and registration fee, where payable.

Correspondence for transmission by the Air Mail Service will be accepted daily (except Sundays) at the London post offices indicated below. Letters must be handed over the counter, and the latest times of posting will be as follows :—

G.P.O., King Edward's Building (11 a.m.); Threadneedle Street (10.45 a.m.); Lombard Street (10.45 a.m.); Parliament Street (10.45 a.m.); Charing Cross (10.50 a.m.); W.C. District Office (11.10 a.m.); W. District Office (11.15 a.m.); S.W. District Office (10.40 a.m.).

Registered correspondence must be at the post offices five minutes before the above times.

Arrangements will be made at certain provincial post offices for the acceptance of correspondence intended for transmission by the Air Mail Service. Such correspondence will be forwarded as express letters to London and will be dispatched by aeroplane on the following morning.

The correspondence will be conveyed to Paris by aeroplane, arriving in normal conditions in time for delivery in Paris in business hours the same day. Correspondence addressed to Paris will thus be accelerated by about 16 hours. Correspondence for places beyond Paris will be forwarded by the next available train. Correspondence for places in France will be delivered by express on arrival at the office of destination; correspondence for countries beyond France will normally be accelerated by 24 hours.

In the inward direction, correspondence posted in Paris in the morning will normally reach London in time for delivery in Central London (i.e., E.C., W.C., E.1, N.1, N.W.1, W.1, W.2, S.W.1 and S.E.1) during business hours on the same day. It will be delivered immediately on arrival by express messenger without additional charge. Correspondence for provincial towns will be forwarded by the next dispatch from London and will usually gain 24 hours in delivery.

If it is known in advance that flight will be impossible on any particular day, a notice to that effect will be exhibited at the offices mentioned above.

Responsibility for registered correspondence will be admitted under the usual conditions, otherwise correspondence will be accepted at sender's risk.

The Post Office "communiqué" calls for comment on more points than one. On the American aerial mail services such a saving in money (apart from time) was effected over the ordinary train transport that in the summer of this year the rate of postage was reduced to that of all other first-class matter.

It is certainly a sound scheme to fix such a rate that will bear reduction, but to make the rate 2s. 6d. per oz. is sufficient to prevent economical firms and all private persons from sending their mail by the air service. If the rate was decided upon by the Postmaster-General, it would almost appear that he wishes to show his critics that an air mail service is impossible.

If the rate was fixed by Aircraft Transport and Travel, Ltd., why do they charge 2s. 6d. per *oz.* when they will carry freight to Paris at the rate of 3s. 9d. per *lb.* if it weighs over 150 lb. and is carried for five or six days in the week?

"Parcels . . . will not be accepted." This seems fairly obvious, as no one would send parcels to Paris at 2s. 6d. per oz. by post when they may be sent at—at the most—7s. 6d. per lb. by the Airco service.

It seems absurd to have eight stated Post Offices only at which letters may be posted. There can be few difficulties in the way of collecting the letters from any Post Office where they would be specially stamped "air mail." The sorting would delay the letters, but they could always be posted in time to catch next day's mail.

Motor-cyclists will collect the air mail at the various stated post offices and convey it to Hounslow Aerodrome. The Airco machine will arrive at Le Bourget at approximately 2.45 p.m., and the mail again will be conveyed by motor-cycle to Paris, where the letters should be delivered by about 4 p.m.

The air mail will reach Paris in time to be put on the express trains leaving for Italy and Spain at about 8 p.m. or 9 p.m. Thus the letters will be delivered twenty-four hours earlier than by the ordinary post.

Those who have done any flying will know that it is seldom possible to know if the weather will enable a flight to be carried out some hours later, therefore one hopes that a notice that the flight is impossible will be exhibited on every occasion when the service has to be cancelled.

The Bréguet biplanes of the Compagnie Générale Transaérienne are to carry the air mails as well as Aircraft Transport and Travel, Ltd.

One can only hope that a sufficient number of persons will send their correspondence by the air mail service to justify its existence, and that the high rate of postage will be reduced.

Lieut. McMullin (ex-R.A.F.) left Hounslow Aerodrome at 12.30 p.m. on Nov. 10th with eight bags of mails, although the aerodrome commander reported the weather as "totally unfit." The machine was embellished with "*G.R.*" streamers on struts and tail. After staying in the air for five minutes the pilot landed and reported complete invisibility. It is extremely unfortunate that the air mail service has been started in November, the worst flying month of the year.

Civil Aerodromes

The Air Ministry announced on Nov. 8th that the following lists of aerodromes are issued as an addition to or amendment of the lists recently published.

List C. (Aerodromes temporarily retained for Service purposes.)

Amendments.

The following aerodromes have been transferred to List E and are now published in that list :—

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Leighterton	Tetbury	Stroud
Lopcombe Corner	Grateley	Salisbury
Rendcomb	Foss Cross	Cirencester

List D.—(a) Aerodromes licensed for all types of Aircraft.

Aerodrome.	Location of Aerodrome.	Nearest Large Town.
Cricklewood	Cricklewood	London

List D.—(b) Aerodromes licensed as "Suitable for Avro (504K) and similar types of aircraft" only. Except in very few instances accommodation does not exist. The licences have also in the majority of cases been issued for limited periods only.

Aerodrome.	Location of Aerodrome.	Nearest Large Town.
Billesley	Yardley Wood Road	Birmingham
Altrincham	Woodlands Park	Altrincham
Rugby	Polo Ground, Spring Hill Farm	Rugby
Chester	Race Course	Chester

A Visit to America.

Major-General Sir F. H. Sykes, G.B.E., K.C.B., C.M.G., Controller-General of Civil Aviation, has arranged to visit Canada, the United States, and, if possible, Newfoundland. The object of his journey relates to the development of international civil flying.

THE CONTINENTAL AIR SERVCES.

The Airco Service.

The London-Paris service has now been running for 11 weeks. Out of 166 scheduled flights, 149 have been successfully accomplished. Eight flights have been prevented altogether, owing to weather. Six flights have been interrupted owing to weather and three interrupted owing to mechanical defect.

THE WEEKLY COMMENTARY.

The description of the work of the Experimental Depot at Grain is continued in this issue.

Two seaplanes of some interest are described, and the first authentic account of the two "Kittens" with the two-cylinder A.B.C. engines is given. These machines are fairly well known by name, but the accounts which have been circulated concerning them have been very incomplete and generally inaccurate.

Illustrations and descriptions—parallel to those given last week of the Friedrichshafen machines—of the Gotha seaplanes are given in this issue by Mr. Hildesheim.

Gotha seaplanes were less heard of in this country than were those of the F.F. Company, but there seems to have been little difference in the number of types produced by the two firms.

Illustrations of a number of recent Roland machines, manufactured by the L.F.G. Co., of Adlershof, appear on page 1685 *et seq.*

Most of the machines are of the single-seat fighter type, of distinctly German appearance, and many of them are—even for German machines—extremely eyeable.

THE WORK OF THE MARINE EXPERIMENTAL AIRCRAFT DEPOT, ISLE OF GRAIN.—(*continued.*)

By Capt. W. H. SAYERS, Late R.A.F.

Very shortly after the laying down of the original designs of P.V.4, Port Victoria was asked by the Air Department to submit a design for a single-seat seaplane to a specification known as N.2.B. This called for two 65-lb. bombs carried within the fuselage, four hours' fuel, machine-gun and ammunition, an alighting speed not exceeding 40 knots and a top speed of 85 knots at 6,500 ft. The engine specified was the same 150-h.p. Smith "Static" as proposed for P.V.4.

Assuming the engine performance, it was believed that the conditions could be complied with, and two designs were got out to meet the case.

P.V.5 and P.V.5a.

One—known as P.V.5—was a modified P.V.2, with a large upper wing and a small lower one, rigid bracing to the chassis and no lift wires, a high-lift wing section and a wing loading of 10 lb. per sq. ft.

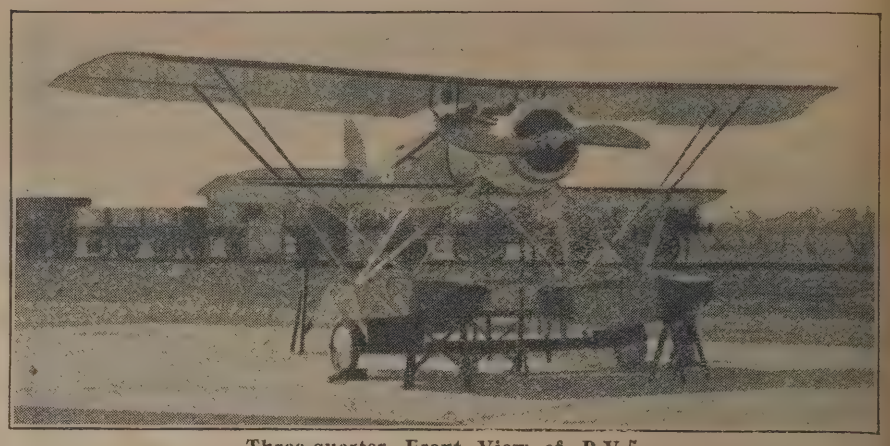
The second design—P.V.5a—was of normal design, equal upper and lower wings and cable bracing. The wing loading was considerably reduced and a high-speed wing section was used. The intention was to make as close a comparison as possible between the wing-and-a-half type with heavily loaded wings and the normal type of biplane, and to determine whether in full-size work the hopes of the designer for the former type would be fulfilled.

Towards the end of 1916 both these machines were in an advanced stage of construction, and with P.V.4, were being held up by the non-arrival of their engines.

At that time P.V.4 was considered to be important, and Wing Commander Aldwell (as he then was) paid a visit to the Engine Section of the Air Department and made urgent representations in the matter.

A promise of engines immediately was forthcoming which materialised some week or so later in the form of one 150-h.p. Hispano-Suiza and one 190-h.p. Rolls-Royce. Neither of these two engines could by any means be fitted to P.V.4, but the 150 h.p. Hispano-Suiza was eventually, after sundry modifications, installed in P.V.5.

At the fusion of the Supply Departments of the R.N.A.S.

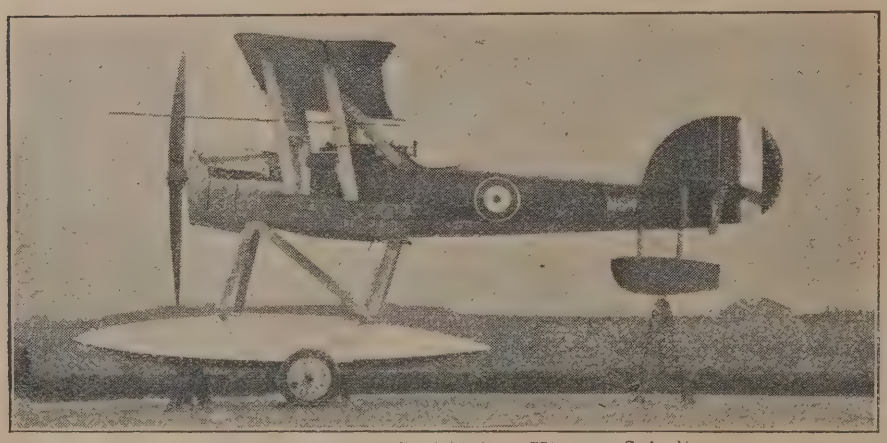


P.V.5 (150 h.p. Hispano-Suiza engine) afloat.

and the R.F.C. under the Air Board the policy of experimental aircraft building at Grain was very nearly abandoned, but it was decided to carry on P.V.5 and to drop P.V.5a.

As originally designed P.V.5 and P.V.5a were to be fitted with Linton Hope type floats, but in the case of P.V.5 these were abandoned in favour of floats of pontoon construction with outwardly sloping bottoms intended to produce the shock-reducing qualities of a V-bottomed float and at the same time keep the spray out of the airscrew.

This modification was due to Squadron Commander (now Wing Commander in command at Grain) Busteed, and fulfilled the expected purposes admirably. These particular floats were, however, extremely unfortunate.



Three-quarter Front View of P.V.5.

On alighting after her first flight some square feet of bottom ripped off one float and the machine capsized. She was salved with surprisingly little damage and rebuilt. Serious trouble was encountered thereafter in getting her onto the special trolley demanded by the shelving float bottom, as unless the floats were in exactly the right place very serious bending stresses were set up in the cross-tubes of the chassis, and through them in the whole wing structure.

For similar reasons it was impossible to beach the machine.

Eventually, at the end of an official test flight, the machine turned over on her nose while taxying—an accident generally ascribed to the floats being insufficiently far forward, but which was actually caused almost entirely by a singular and inexplicable error of judgment on the part of one of the finest seaplane pilots in Britain.

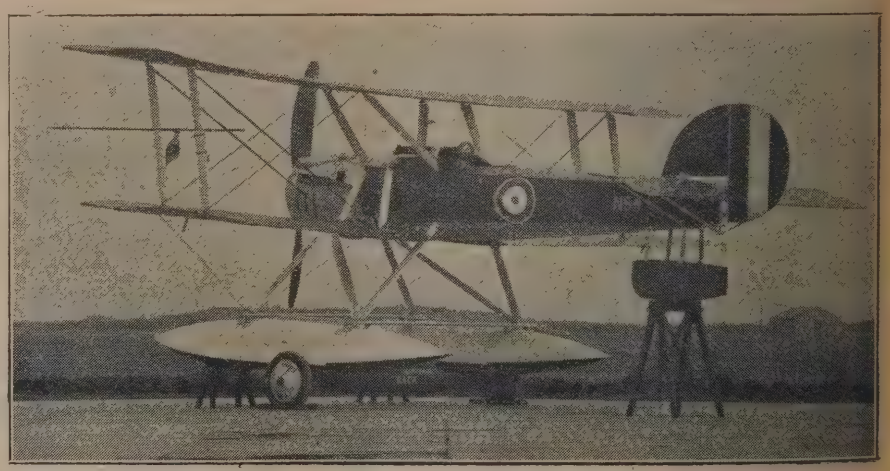
Side View of P.V.5a (200 h.p. Hispano-Suiza).

This machine was, apart from her unfortunate floats, extremely satisfactory. The pilot's view was good, her flying qualities were praised by all who flew her, and she was unusually comfortable. The performance was not up to that anticipated, partly because trials were made with a different airscrew which held the engine speed down, but mainly because the engine and mountings were much heavier than those of the original design.

The specification following gives particulars of P.V.5 :—

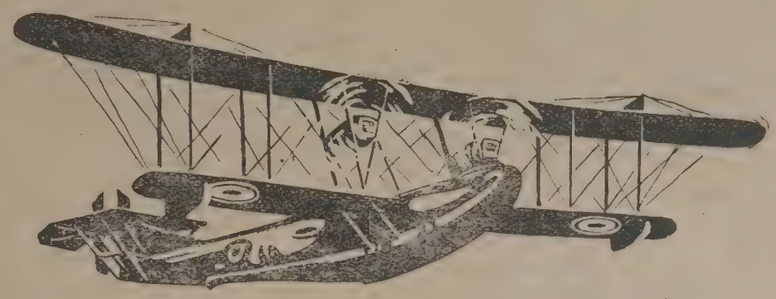
Type of machine .....Seaplane Scout
Name or type number of machine P.V.5
Purpose for which intended
Fighter and light bomber
Span .....top, 32 ft.; bottom, 21 ft.
Gap .....4 ft.
Overall length .....25 ft. 6 in.
Maximum height .....9 ft. 9 in.
Chord .....top, 6 ft.; bottom, 3 ft. 6 in.
Total surface of wings .....245 sq. ft.
Engine type and h.p.
Hispano-Suiza, 150 h.p.
Weight of machine empty .....1,788 lb.
Disposable load apart from fuel ...375 lb.
Total weight of machine loaded 2,456 lb.
Load per sq. ft. .....10 lb.
Weight per h.p. .....16.2 lb.
Tank capacity in gallons petrol 36; oil 4

PERFORMANCE—
Speed at 4,000 ft. .....82 knots.
Landing speed .....40 knots.
Climb—
To 9,000 ft. .....35 min.



P.V.5a was eventually completed with a 200-h.p. Hispano and very considerably improved on the specification figures for performance, and was quite a good machine.

Both in view and in manœuvring qualities P.V.5 was far the better of the two, and had she been fitted with the same engine—as it was intended—would have had a better all-round performance.



However, by the time these machines were tested it had been officially decided that the type was not needed for service purposes. Large numbers of machines in every way inferior to either of these were later ordered and used for the purpose for which these were designed—but that was only to be expected.

The main dimensions, etc., of P.V.5a are given below :—

SPECIFICATION.
Type of machine .....Seaplane Scout
Name or type number of machine P.V.5a
Purpose for which intended
Fighter and light bomber
Span .....33 ft. 1 in.
Gap .....5. ft.
Overall length .....26 ft. 9 in.
Maximum height .....13 ft. 1 in.
Chord .....5 ft.
Total surface of wings .....309 sq. ft.
Engine type and h.p.
Hispano-Suiza, 200 h.p.
Weight of machine empty .....1,972 lb.
Disposable load apart from fuel .....245 lb.
Total weight of machine loaded (without bombs).....2,518 lb.
Load per sq. ft. .....8.15 lb.
Weight per h.p. .....12.6 lb.
Tank capacity in gallons .....petrol, 41; oil, 5
PERFORMANCE—
Speed at 2,000 ft. .....89 knots.

Three-quarter Rear View of P.V.5a. The attachment to the interplane struts is a special Pitot tube for speed tests.

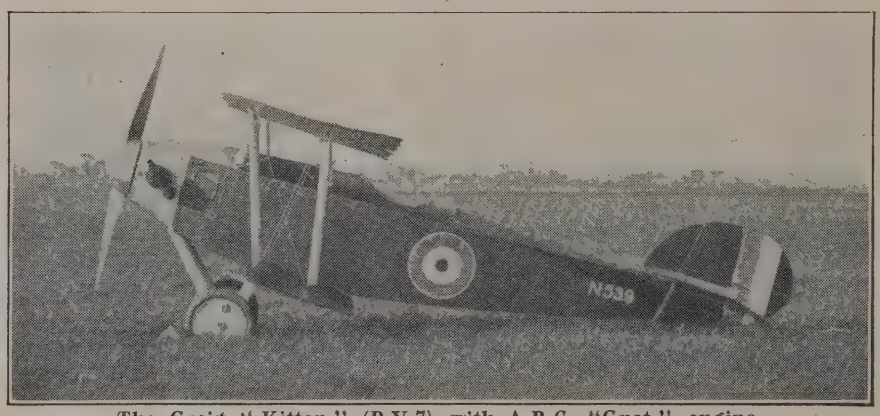
The Kittens

During the period of construction of P.V.5 and P.V.5a Port Victoria was asked to report upon the possibilities of building a very small reasonably high performance single-seater fitted with a two-cylinder A.B.C. engine of 45 h.p.

The general idea was to produce a machine sufficiently small to be carried by torpedo-boat destroyers and other small craft and capable of getting off a very confined deck space. The Experimental Flight at Eastchurch, under the command of Squadron Commander Busteed, were set the same problem.



Front View of P.V.5a with 200 h.p. Hispano-Suiza engine.

Both Port Victoria and Eastchurch produced designs and were instructed to proceed with the construction thereof. When Commander Busteed migrated from Eastchurch to take command of Port Victoria he imported the partially built Eastchurch machine, and both were completed, one alongside the other, in the Port Victoria workshops.

These machines were known as the Grain and the Eastchurch "Kittens," P.V.7 and P.V.8—the missing P.V.6 being represented by the preliminary lay-out of a high-speed land scout which never proceeded further.

The two machines differed vastly. P.V.7 continued the Port Victoria tradition of the wing-and-half arrangement, combined with a relatively high loading on a high-lift wing. Unfortunately the wing section developed for this case was by no means a success and the machine was not really satisfactory. The design was based on a total loaded weight,

The Grain "Kitten" (P.V.7) with A.B.C. "Gnat" engine.

with pilot, gun, ammunition, and three hours' fuel, of 520 lb., a figure laughed to scorn by the technical advisers to the Air Department at the time, but which was in fact somewhat higher than the realised one.

Very ample stabilising surfaces were fitted, as it was feared that the machine would be uncomfortably quick in her movements, and, apart from the special wing curve, great care was taken to avoid novel and untried features in the design.

The Eastchurch design was based on a much higher total weight and much lighter wing loading.

Equal top and bottom wings were fitted with an enormous stagger, and the single plank interplane strut used on the Sopwith triplane was adopted.

No fixed tail plane was provided in the original design, but a balanced elevator of Morane-like aspect was fitted.

No springing was fitted to the chassis, large diameter tyres being relied upon, and the main lift wires were taken to the axle centre.

As with most of the other Port Victoria-built machines, the engines failed to materialise, and eventually, instead of the 45 h.p. geared-down engines, 35 h.p. ungeared engines of the same make were fitted.

This involved some considerable modification to the engine mounting in both cases, as the engines had to be raised some 6 in. above their intended position to bring the thrust line into its proper place and to give adequate airscrew clearance. The Grain design was completed first and created rather a sensation. The performance was fair, though not up to expectation, and the machine was very difficult to handle on the ground.

She was eventually fitted with a new set of wings of tried section, the chassis was moved forward to prevent tail-chasing on the ground, and the tail plane was modified to get over a considerable tail heaviness found during her trials.

As far as can be ascertained the machine has never been flown since these alterations were made.

The Eastchurch machine on her first flight showed serious longitudinal unsteadiness, and part of the elevator balance was cut off and a small fixed surface was added. The result of this alteration was so marked as to lead to a belief that overbalancing of the elevator was the real trouble—as the total fixed surface added was less than 2 sq. ft.

With this alteration the machine was remarkably successful. In spite of a very considerably greater weight the performance was better all round than that of the Grain design, and the machine was extremely easy to fly.

Owing to the Sopwith triplane type of struts used, and some resemblances of detail fittings to Sopwith practice, this machine was very commonly believed to be a Sopwith product, and has actually been described in official publications as the "Sopwith Kitten." This, therefore, seems an opportunity for giving the credit to the actual designer, the late Capt. G. H. Millar, R.A.F., who, as Lieut., R.N.V.R., was Commander Busteed's chief technical officer at Eastchurch, and who joined the staff at Port Victoria on Commander Busteed's succession to that command.

These two machines were completed in the summer of 1917.

The specifications of the two "Kittens" are as follows:—

THE GRAIN "KITTEN."

Type of machine .....Small scout.
Name or type number of machine .....P.V.7 (Grain Kitten).
Purpose for which intended .....Shipboard use.
Span .....top, 18 ft.; bottom, 12 ft. 7 in.

Name or type number of machine, P.V.8 (Eastchurch Kitten).
Purpose for which intended .....Shipboard use.
Span .....19 ft.
Gap .....3 ft.
Overall length .....15 ft. 7½ in.
Maximum height .....5 ft. 5 in.
Chord .....3 ft.
Total surface of wings .....106 sq. ft.
Engine type and h.p.
A.B.C. 35 h.p. "Gnat."
Weight of machine empty .....340 lb.
Disposable load apart from fuel 150 lb.
Total weight of machine loaded 586 lb.
Load per sq. ft. .....5.5 lb.
Weight per h.p. .....16.7 lb.
Tank capacity in galls.....petrol 9; oil 1
PERFORMANCE—
Speed at 2,000 ft. .....82 knots
Landing speed .....40 knots
Climb—
To 10,000 ft. .....20 min.

Front View of the Eastchurch "Kitten."

(To be continued.)

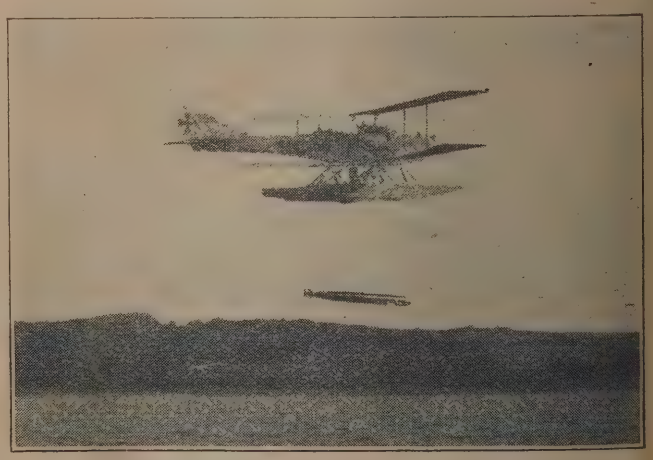
BRITISH INTERNAL COMBUSTION ENGINES, LIMITED.

Mr. R. Henry Wheeler, presiding at the first annual general meeting of British Internal Combustion Engines, Ltd., said :—

"I would remind you that the company was only registered in April, 1918, and I think you will agree that it has already given a very good account of itself. As the company pays the income tax up to 5s. in the £ on the dividends, they are equivalent to £9 7s. 6d. per cent. on the preference and £6 5s. per cent. on the ordinary shares

"As you are aware, the Green Engine Co., Ltd., is the proprietor of the British, Foreign, and Colonial patents under which the Green engine is designed and manufactured. This engine was famous as the winner of the Naval and Military Aeroplane Engine Competition, winning the first prize of £5,000 for the best aeroplane engine immediately prior to the war, and it is very significant that in the first race after the war its 35-h.p. engine beat all competitors in the Aerial Derby handicap at Hendon in Messrs. A. V. Roe and Co.'s new 'Baby Avro' aeroplane.

"As a result of its recent remarkable performances many inquiries have been received and some very satisfactory business has already been concluded, justifying the forecast made at our statutory meeting that the Green engine would again take a foremost place in the great future of aircraft of all kinds for naval, military, and commercial purposes. These engines are now standardised in five sizes—viz., 35, 100, 160, 275, and 450 h.p., and in addition an engine of 1,000 h.p. is in course of completion.



"You will be pleased to know that Green engines were fitted into many of the submarine-chaser coastal motor-boats for the Admiralty, and proved a great success in the Zeebrugge and Ostend raids. Mr. G. Green, the designer of these engines, is a successful inventor who is always at work exclusively in our interests, and he may well be proud of the results obtained. Further developments are pending in connection with Green engines which should prove to be a source of considerable additional profit to this company.

"The position of the Aster Engineering Co., Ltd., may be judged from the fact that since we became interested its dividend has been doubled. This company makes the 'Aster' internal-combustion engine, which is well known all over the world as a power unit in connection with road transport, electric generating sets, electric welding, wireless telegraphy, salvage work, ships' lighting, etc.

"The Aster Engineering Co., Ltd., is fully booked up with profitable orders for more than a year ahead, and is further developing the manufacture and extending the markets both here and abroad for its own specialities. This settled policy has created a most valuable goodwill, which does not figure among the assets in its balance-sheet. The works are being enlarged as rapidly as possible, and additional machinery is being installed.

"Some idea of the importance and great future of the internal-combustion engine in the matter of road transport has recently been brought home to the public, and now that an ample supply of petrol, paraffin, and crude oil is assured the demand for various types of internal-combustion engines as power units for all purposes, both on land and sea, is bound to increase year by year Our associated companies are pioneers in the development of the internal-combustion engine for aviation, road transport, and the generation of electricity, and we are therefore in a position to take full advantage of the great future before this industry.

"The energy and foresight of Mr. Sydney D. Begbie and Mr. Fred May, the managing directors of the Aster Engineering Co., Ltd., and the Green Engine Co., Ltd., respectively, are mainly responsible for the present satisfactory position. The enthusiasm and keenness of these gentlemen are reflected in the attitude of their staffs and workmen, with whom they are in constant and direct touch, and the results speak for themselves."

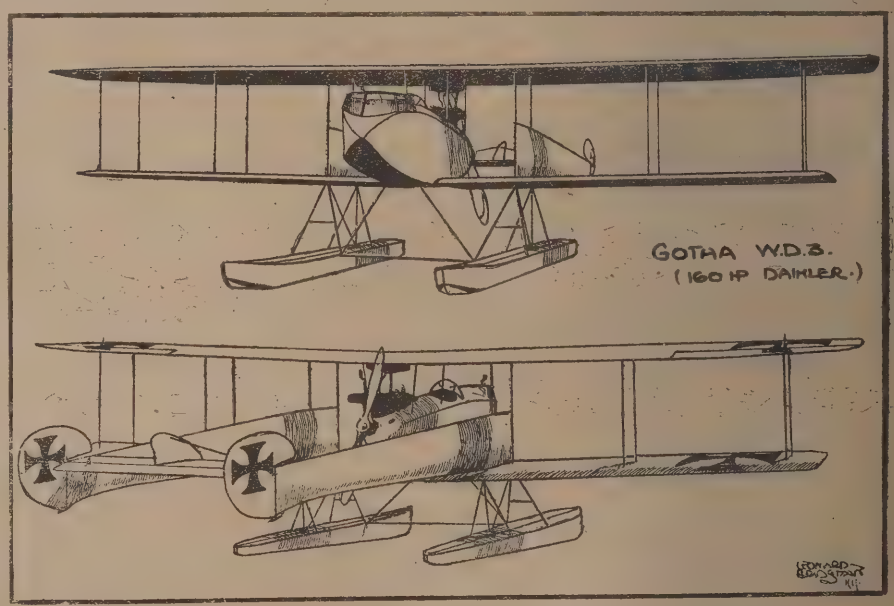
THE GOTHA SEAPLANES.

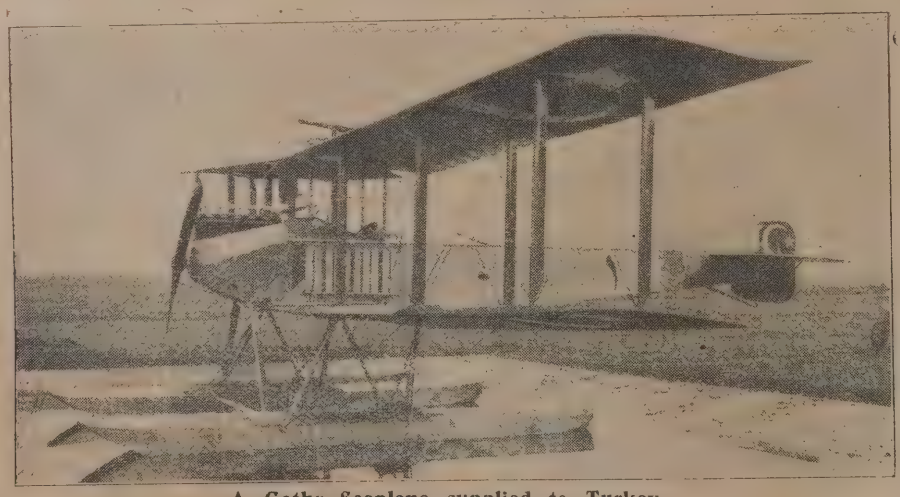
By Erik Hildesheim.

The Gotha works came to the fore some time before the war as the aircraft department of the established waggon works, and concentrated their activities on the then favourite Taube monoplane model, their pilot Schlegel being second winner in the "Nationalflugspendi" 24 hours' overland flight.

The Gotha works took up the quantity production of the Ursinus twin-engined biplane, built experimentally at Darmstadt, and this type was also turned out as a seaplane and developed into the torpedo-carrying and long-distance patrol aircraft.



The Ursinus Seaplane (two 160 h.p. Mercèdes Motors), built by the Gotha Works.



Early in the war the 100-h.p. Gnome-engined Falcon scout was built by the Gotha works as one of the first German replies to the British scout, but the name of Gotha has been chiefly associated with the twin-engined bomber, the first aircraft of that type to be employed by the Germans. It is not usually known that at Gotha was built the first experimental 3-engined giant biplane for Count Zeppelin. This afterwards developed into the well-known Staaken model.

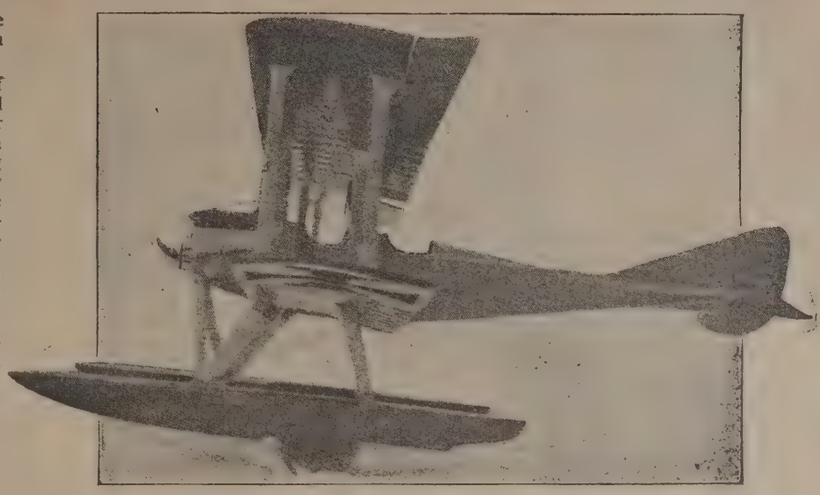
Although the Gotha works, situated in the centre of Germany, were the only German aircraft enterprise not having a seaplane branch of their own, they were large contractors to the German navy, beside being the chief furnishers to the Turkish naval air service. In 1914 the Gotha works arranged with the city of Rostock to have a plant and sheds erected near Breitling, which were used when preparing for the Warnemünde seaplane competition, for which two 150-h.p. Benz and Rapp-engined Gotha seaplanes were entered.

When the war broke out this plant was taken over by the Navy and formed the nucleus of the present Warnemünde air station.

Even in 1914 the Warnemünde entry biplanes were supplied in series, and in spring, 1915, the Imperial Naval Office

A Gotha Seaplane supplied to Turkey.

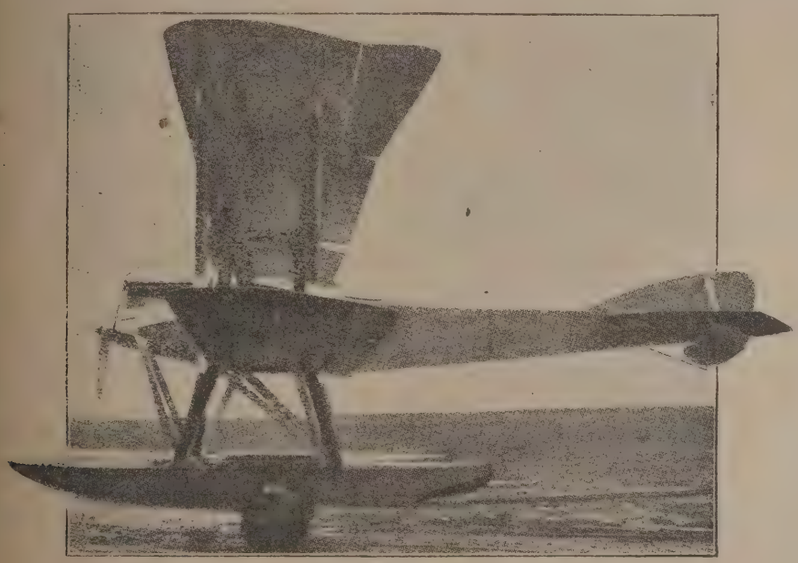
ordered five new Gotha types, viz., the W.D. (i.e., Wasser Doppeldecker = seaplane), 3, 5, 7, 8, and U.W.D. (Ursinus seaplane).



The chief designer of the firm was Diplom-Engineer Karl E. M. Rösner, and during the war 30 float-types were built, the first ones with sharp bows to the floats, then with extended stern to increase longitudinal stability and to prevent the fuselage from getting in contact with the sea, next the standardised streamlined type floats, and finally two-stepped floats for the heavy aircraft.

The original float-springing was soon dropped to the order of the naval authorities. The floats were always made with watertight compartments bulkheaded off and coated with varnish, or later with tar oil varnish on account of the shortage of boat varnish. When the three-ply wood grew of inferior quality towards the end of the war the floats

were made either completely or with the exception of the side walls of thin duralumin sheets.

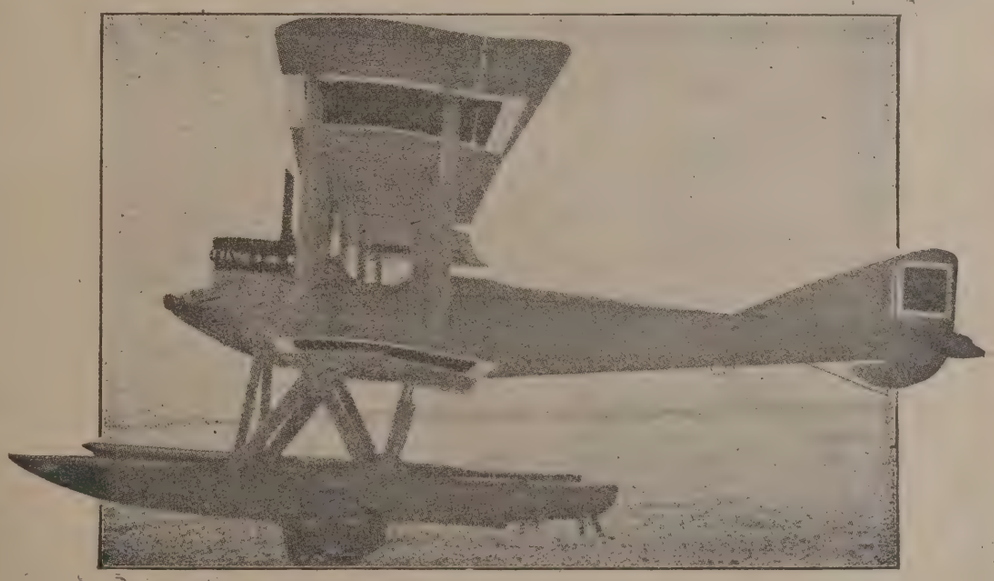


The Gotha Model 3 seaplane was of the twin-bodied pusher type, first heard of as an Ago type land-going scout or two-seater, the central nacelle, with a 160-h.p. Daimler motor installed, being of the Farman type, and the empty bodies replacing the triangular tail-tube construction of the ordinary pusher biplane, forming an improvement in head-resistance and in longitudinal stability. The front observer cockpit was provided with gun-mount, wireless plant and bomb-dropping device.

Model 5, with a 160-h.p. Daimler motor, was the first small speedy German tractor seaplane, from which the naval scout eventually developed and was the favourite of the commander of the Holtenau naval air station, Captain Lt. Langfeld, who kept it for his private use, even when appointed C.O. of the naval air station in Constantinople.

The Gotha W.D.12 Seaplane (160 h.p. Daimler engine).

Gotha type F. was the first twin-engined aircraft ordered by the German navy, being a two-float tractor seaplane, equipped with two 120-h.p. Mercédès motors, mounted on the lower planes above the floats. The observer and the gun mount were in the front cockpit, followed aft by the pilot, and the two tail fins and balanced rudders—beside the central fin—were arranged on each side of the undivided elevator.

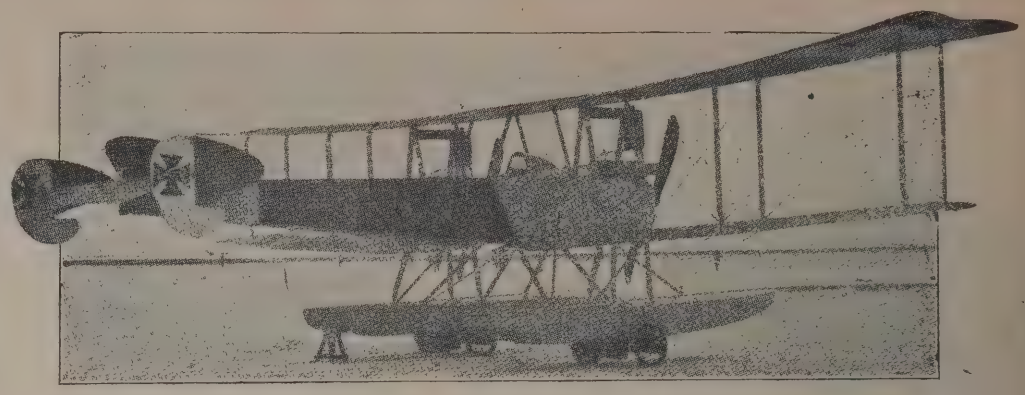


The Gotha Model 15 Seaplane, equipped with a 260 h.p. Daimler engine.

In the next model, No. 7, again a twin-engined seaplane, and the naval version of the Ursinus pattern, the two fins and non-balanced rudders were raised above the one-piece elevator. The W.D.7 was ultimately employed as school mount in the torpedo schools. The W.D.8 turned out with a single 240-h.p. Maybach engine installation and rear observer seat was the first high-powered German seaplane, the production of which was not entered into till two years later.

The Ursinus seaplane was equipped with floats of a length of 8.5 metres and was of the main dimensions: Length, 14.2 metres; span, 20 metres; area, 82 sq. metres; empty weight, 2 tons (1,940 kilos.); useful load, 350 kg.; extra load, 540 kg. The power plant was two opposite rotating 160-h.p. Mercédès motors and the speed amounted to 158 kilometres per hour. According to the Ursinus patent the fuselage was raised to enable the centralising of the engines as far as having the screw-tips almost touch with the object of improving the control of large aircraft, and owing to the presence of the low floats the aircraft remained stable. The fuselage nose was made of three-ply wood and acted as observer cockpit with machine-gun mount and bomb-dropping device.

To facilitate railway transport the seaplane could be taken down in three parts, the central one with fuselage and motors remaining intact.

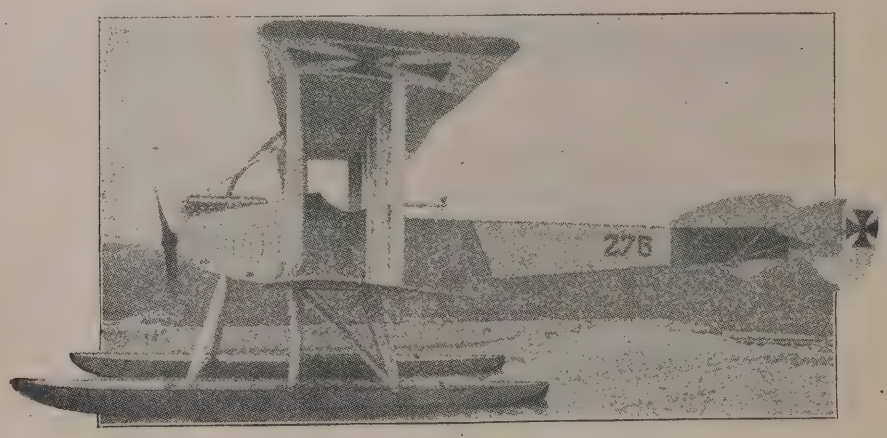


The type was nicknamed the Trojan Horse, dating from an acceptance flight in Warnemünde, when six passengers had been carried instead of sand ballast,

A Modern Gotha Seaplane, built for Turkey.

their sudden appearance on landing causing the above remark from the Government inspector, Marinebaumeister Boatz.

The Gotha works were next ordered by the Imperial Naval Office to remodel type 2 for a combined wheel and float under-carriage for Turkey, the seaplanes having to be transported by land, as Roumania had refused to sanction any transit. So a shaft with wheels on both sides of the floats were mounted below them, the latter acting as brakes by means of aft extending skids. Another feature was the rather old-fashioned top plane gun position calling for a standing position of the gunner-observer.



The Gotha Model F (two 120 h.p. Mercédès engines).

The seaplanes were sent by railway to Herkulesbad, in Hungaria, erected there and flown with spare parts across Roumania and Serbia to Lom-Polanka, in Bulgaria, from where they could again be transported to Constantinople. Further Gotha models of more modern streamline aspect supplied to Turkey are shown in illustration.

Model 12 was the next step in improving the German naval seaplane, cutting head-resistance with the aim of getting high-speed patrol machines. Equipped with a 160-h.p. Mercédès motor the attained speed was 141 kilometers per hour. The main dimensions were a length of 10 m., a height of 3.825 m., 15 m. span of top planes and 14 m. of lower ones, an area of 54 sq. m., a net weight of 1 ton without fuel or water, a useful load of 550 kilos., the total weight amounting thus to 15 tons. Fuel was carried for a flight of 5½ hours' duration, and the performance figures for climb were: 7.5 minutes to 1,000 metres; 1.500 m. in 12 min.; 2,000 m. in 19 min., and 3,000 m. in 41 min.

The Gotha model 15, with its 260-h.p. Mercédès engine, was the highest powered and the last single-engined type to be supplied to the German Navy. The results obtained with the large seaplanes encouraged the Imperial Naval Office to commence the building of torpedo-carrying seaplanes, the Gotha works turning out the models 11 and 14, the respective main figures being as follows:—

A Gotha Seaplane similar to the Model F, but with one 260 h.p. Mercédès engine.

Gotha W.D.11.—Overall length, 13.43 m.; overall height, 4.75 m.; span, 22.51 m.; total area, 103.4 sq. m.; motor plant, two 160-h.p. Mercédès; speed, 120 km.p.h.; climb, 1,000 m. in 12 min., 1,500 m. in 20 min.

Gotha W.D.14.—Overall length, 14.4 m.; overall height, 5 m.; span, 25 m.; total area, 131.7 sq. m.; motor plant, two 200-h.p. Benz, speed, 126 km.p.h.; climb, 1,000 m. in 17 min.; 1,500 m. in 38 min.

The net weights amounted to 2,146 kilos., and 3 tons, and useful load of 972 kg. and 1,183 kg., respectively, could be carried beside 465 kg. and 782 kg. fuel.

The W.D.14 was the later model, showing an increase in dimensions and being provided with tractor screw-drive instead of pusher as in the former, the beam of the fuselage being further increased to enable a side-by-side seating arrangement of pilot and observer, who could take turns at pilotage, the control lever being shiftable. W.D.11 had the usual tandem seating with observer in the fuselage nose in front of the planes. The W.D. 14 model was further provided with a folding arrangement, when the span was lowered to 8.7 metres, the length increasing then to 15.1 metres. The torpedo was carried below the body and a special dropping gear was provided. In an attack the seaplanes would come down to a height of 20 to 30 ft. and launch the torpedo on the object.

The same seaplanes were used also for mine-laying both on the French and English coasts and against the Russian naval forces, being employed further during the raid in Krisland for the occupation of the island of Oesel for the transport of troops, landing machine-gun detachments, who conquered the surrounding small islands. For mine-laying, the torpedo gear was replaced by mine racks, or again by special petrol tanks to be dropped in case of long-distance patrol flights of 11 to 12 hours' duration in the North Sea.

Finally, a special version of the land-going Gotha model was turned out for long naval patroling, the dimensions were identical with those of W.D.14, but the performance was improved by the employment of two 230-h.p. Benz motors, a climb to 1,000 metres being thus attained in 15 minutes, while it took 25 minutes to reach 1,500 metres. The total weight of the twin-engined seaplane amounted to over 4.5 tons (4,540 kilos.) and comprised a net weight of 3 tons (3,030 kilos.), 1 ton fuel (1,024 kilos.), and 0.5-ton useful load (486 kilos.).

TRIPLEX GLASS AT OLYMPIA MOTOR SHOW.

As Triplex Glass became almost universal on Service aeroplanes and motor vehicles so it is becoming on all private motor vehicles, and at the 1919 Motor Show the following well-known motor manufacturers will have Triplex Safety Glass windscreens as a standard fitting in their cars:—Straker-Squire, Singer, Star, Lanchester, Hillman, Mercury, etc., etc. Morris Russell and Co. will be showing a special Triplex windscreen for Ford cars, and the Auster-Triplex and the Beatonson Triplex Backscreens will be on view on Auster's and G. Beaton and Son's stands respectively.

It is interesting to note that several insurance companies are allowing rebates approximating to 22½ per cent. on premiums when cars are fitted with Triplex windscreens, etc.

NEW AIR TRANSPORT COMPANY.

As a result of the meeting of 50 business men at the Athletic Club in Los Angeles, Cal., the incorporation of a company known as the California, Great Western and Inter-State Air Route has been announced. The company has been incorporated at $1,000,000, and intends to develop commercial aviation in the Western States of America.

According to the report, the company will establish and operate landing stations and use various types of aircraft. It will make every effort to stabilise the Air Industry. Plans have been made for standardised landing stations at Los Angeles, San Francisco, Oakland, Sacramento, and other places. It is said that the cost of the offices and hangars to be erected on each landing ground will be from two to three million dollars.

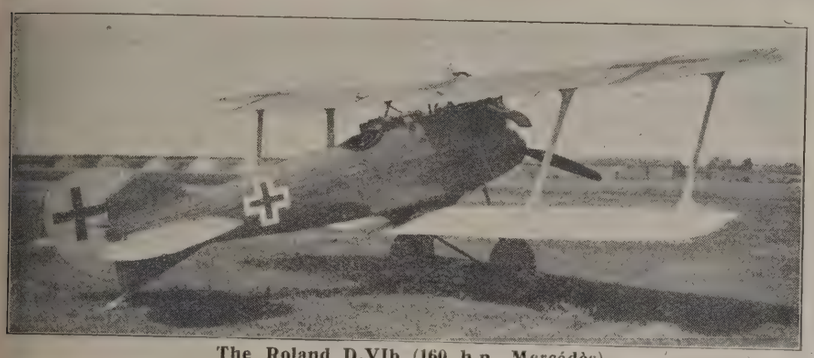
RECENT GERMAN WAR MACHINES.

I.—L. F. G. Roland.



The Luft Fahrzeug Gesellschaft (L.F.G.), of Adlershof, the manufacturers of the well-known "Roland" aircraft, must be reckoned amongst the pioneers of aviation. They are the direct descendants of the original German Wright Company. Roland machines played an active part in the late war, and the photographs attached of certain machines of this make, most of which are of recent date, and which have not previously been illustrated in this country, are of considerable interest.

THE D.VIA FIGHTER.

The first picture represents a type D.VIa single-seat fighter, fitted with a Mercédès 160 h.p. engine, built in 1918. A noticeable feature is the extremely well-shaped fuselage which the photograph reveals as constructed of longitudinal planks—a real boat-built body, in fact. The cowling of the engine is also remarkably neat. The radiator is carried in the top centre section.

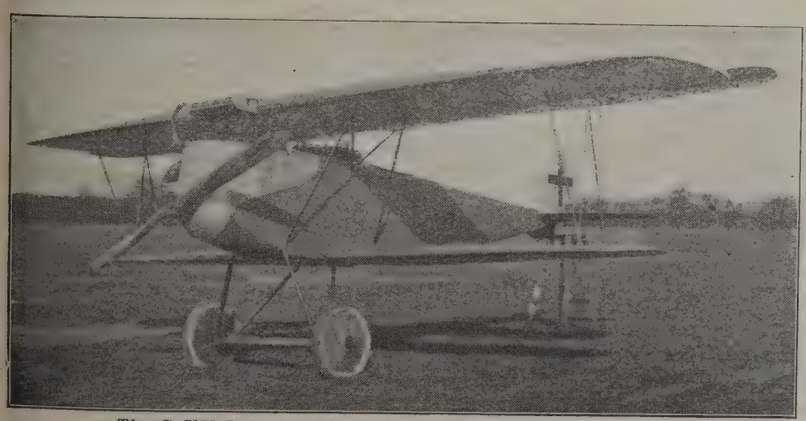
The Roland D.VIa of 1918 (160 h.p. Mercedès).

The Roland D.VIb (160 h.p. Mercédès).

The undercarriage appears to be remarkably slender in its members—suggesting the use of circular section tubes unstreamlined. This feature recurs almost throughout the series.

AND A MODIFIED VERSION.

The second picture represents a D.VIb of somewhat later date, apparently employing the same fuselage and tail unit, but with a different wing structure. There are now two single I struts on each side of the fuselage, each strut supporting both spars, in place of the normal single row of two struts, one on the front and one on the rear spar.



The picture of this machine shows the characteristic German habit of using a vertical fin both above and below the fuselage. The neat way in which the lower fin acts as a fairing for the tail skid support is noteworthy.

A ROTARY-ENGINED EDITION.

The third picture—D.XIV type, appears to be a D.VIa type adapted to a rotary engine—probably the 11-cylinder Siemens engine, recently described in this paper. The fuselage appears to be of the boat-built type, of increased diameter forward to accommodate the engine, but in other respects the machine closely resembles the D.VIa.

The Roland Type D.XIV with Rotary engine.

The D.XV Roland of the Fokker influenced Wireless Type.

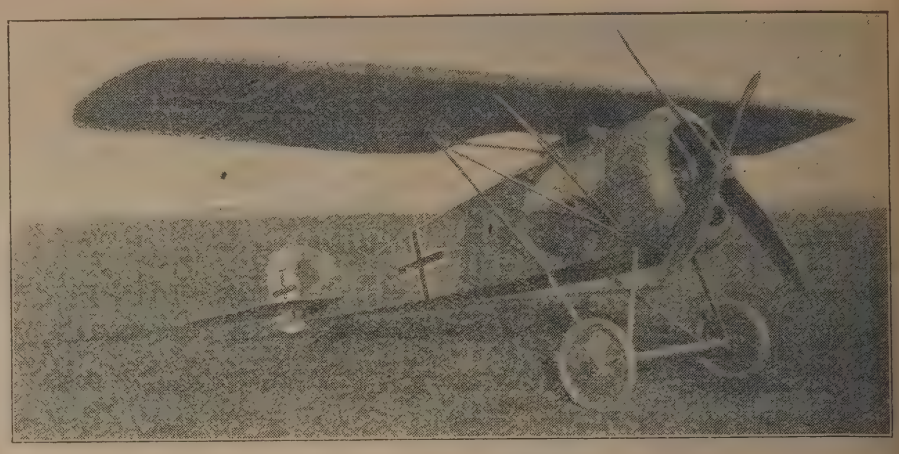
The engine cowling in this machine seems to be designed on a very optimistic estimate of the self-cooling properties of a rotary engine—and it is very difficult to believe that the engine can have kept cool within it.

D.XV.—A WIRELESS TYPE.

In the fourth picture there is a marked change. The machine represented is the type D.XV, a biplane of the cantilever wing type, now so popular in Germany.

The upper wing has the characteristic great thickness in the centre section tapering to the tips which are common to this type of machine, and there are no lift or landing wires. The boat-built fuselage has disappeared in favour of a slab-sided structure tapering to a horizontal knife-edge aft, and the shape

of the rudder and fin is quite different from that of the previous examples. It seems probably the effort of a different designer.



It seems very possible that most of the machines of this general type—manufactured by all sorts of firms and known by the name of the manufacturing firm—were, in fact, essentially of the same design, subject to minor modifications of detail to suit the builders' manufacturing facilities.

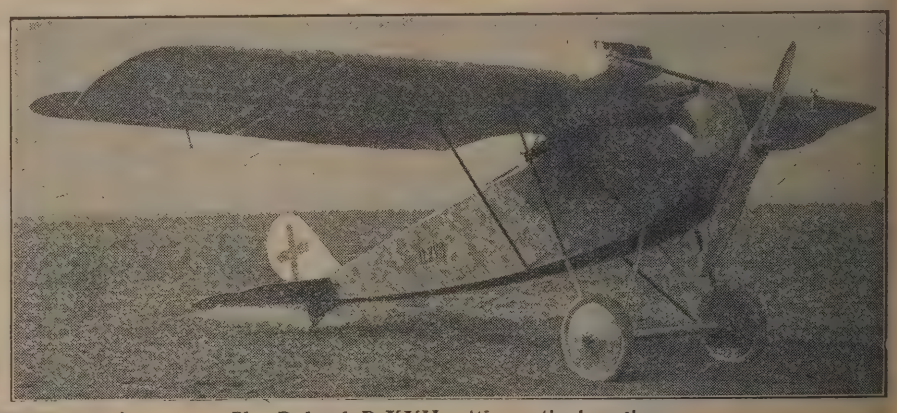
A Monoplane.

The next picture—that of a type D.XVI monoplane—is again a cantilever wing machine, fitted with a rotary engine, and bearing a strong resemblance to the Fokker monoplanes of the same class.

A Reversion to Type.

The sixth picture shows the return of some of the characteristics of the earlier pictures. The fuselage of the D.VIa type is here fitted with cantilever type wings, which are fitted with I interplane struts in place of the rather untidy N form struts, which usually characterise the cantilever wing type of German biplane. Apparently, the wings of this machine are covered with some form of transparent material, and the internal structure of the wing is visible. It should be noted that the front spar and the leading edge are joined together by some opaque material, and it may be assumed that the two are really formed into a single wide spar. Apparently, this spar arrangement has forbidden the neat stowage of the radiator into the centre section, as in the D.VIa, with the somewhat clumsy effect shown.

The Roland D.XVI Monoplane.



A Roland "Wireless" Machine.

In this case it would appear that the Roland designer has had a free hand to build a cantilever wing biplane to his own designs. Whatever may have been the result—as far as performance goes—the product is distinctly more pleasing to the eye than the great majority of this Fokker-influenced type.

The Type D.XVII.

The type D.XVII, shown in the next picture, is an obvious modification of the D.XVI type above, fitted with a vertical six-cylinder engine, instead of a rotary one. In this case the ailerons are balanced, whereas those of the D.XVI appear not to be, and the ar-

The Roland D XVII with vertical engine.

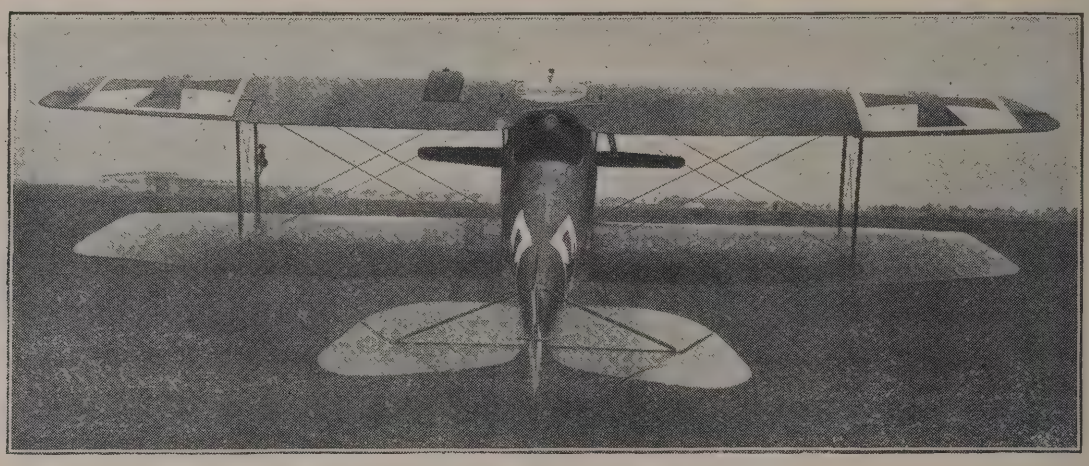
rangement of the wing strutting has been slightly simplified.

Here the Roland designer has not altogether escaped to his own devices, but apparently has been allowed to exercise some portion of the cleaning up capacity which he obviously possesses.



Another Version of the D.VIa.

The machine at the foot of page 1686 would appear to be a slightly modified D.VIa. The engine cowling is slightly changed, and it is obvious that a new rudder has been fitted on the example shown.

This picture shows very clearly the planking of the boat-built body. As in the D.VIa the engine is a Mercédès of 160 h.p. The photograph also shows that this machine has a lower wing of slightly less chord than the upper—

A Roland Triplane of Clean Design.

A Bayern-engined Edition of the Roland D.VIa Type.

which appears to be the case in the D.VIa and D.VIb.

This picture also shows the way in which the lower wings are carried from a kind of keel built out from the body-work, and to which the rear chassis members are also attached.

A Roland Triplane.

The triplane next shown is probably of slightly later date than the D.VIa and b biplanes, and uses again the boat-built body, and a six-cylinder vertical engine. It will be noticed that the top wing is considerably greater in chord than are either of the lower ones, and that ailerons are fitted to all three wings. The bottom ailerons alone have the appearance of being balanced, but this is probably an illusion.

It would seem fairly safe to assume that this was one of the many German machines resulting from the effect of the Sopwith triplane, and that its inception dates back to some time in 1917, and its appearance to the first half of 1918.

A Bayern-engined Machine.

The tenth picture, again, appears to represent a machine very similar to the D.VIa—but, in this case, a three-ply body is used, and the engine fitted is a B.M.W. (Bayern) of 185 h.p.

The position of the radiator, let into the upper centre section, is clearly shown in this view.

A Twin-Screw Machine.

The last picture represents a twin-propeller machine with the power plant in the fuselage, apparently driving the two airscrews by chain. This is, in all probability, a machine of early date.

A Twin-propeller Roland Machine.

Neglecting the last machine, the Rolands illustrated show a characteristic type of machine of extremely neat and graceful design, which has persisted in spite of the irruption into the series of a number of much less handsome types.

It looks very much as though German aircraft designers had suffered at the hands of their indigenous Technical authorities in very much the same way as their British *confrères*.

PHŒNIX PRODUCTS.

A very interesting brochure has been issued by the English Electric Co., Ltd., which gives the war history of the firm, its post-war programme, and, at the same time, in a foreword endeavours to show that aircraft transport compares favourably with other forms of locomotive transport, particularly in connection with the running of flying-boat services in undeveloped countries.

The English Electric Co., Ltd., which is the result of the fusion of the Coventry Ordnance Works, Dick, Kerr and Co., Ltd., and the Phœnix Dynamo Co., Ltd., into one concern, have been engaged on aircraft construction throughout the war, and in 1917 they started on flying-boat construction, building large numbers of F.3 boats, as well as a very successful craft of their own design known as the Phœnix "Cork," which surpassed the specified Air Board performance, and proved to be ahead of the then official design.

As a result of their experience gained in flying-boat construction during the war they are specialising in the flying-boat for their post-war programme.

Four types of boat are projected, ranging from the "Grey Mullet" boat, of 275 h.p., to the Phœnix "Pulex," of 4,800 h.p., which will be capable of carrying 50 passengers, or 6½ tons of goods.

The other two boats (the Phœnix "Cork," of 750 h.p., and the Phœnix "Eclectic," of 3,600 h.p.) were both designed for service purposes, and they are being altered for commercial work.

The booklet is well illustrated, and contains descriptions of all these craft, together with line drawings, as well as a collection of views of some of their war products, etc.

(*Continued from page* 1658.)

During the past week, ending Nov. 8th, the weather was officially reported "Totally unfit for flying" on every day except on Nov. 5th, when it was "Unfit for flying." Despite the mist, fog, snow, hail, rain and very strong winds which carried on, especially over the Channel, during the whole week, machines were able to fly from England to France, as will be seen in the table below, although it was not always possible to land at the destination aerodrome.

An air service to Holland is in preparation, and an aerodrome has been obtained near The Hague.

THE HANDLEY PAGE SERVICE.

On Nov. 1st a Handley Page aeroplane carried twelve passengers, 500 lb. of freight, and nearly 400 lb. of personal luggage to Paris through driving rain. Lieut.-Col. Robert Loraine, the aviator actor, was one of the passengers.

On Nov. 3rd a Breguet machine, working in conjunction with the Handley Page Transport, Ltd., flew from London to Paris in 4 hr. 5 min. with one passenger, through wind, hail, and rain. This was the only machine in the Continental Air Services to accomplish the journey.

According to the newspapers, fourteen passengers and 610 lb. of goods were carried on Nov. 5th on the Handley Page London, Paris and Brussels services. The journey from London to Paris took about 2½ hours, and another machine left Brussels at 11.25 a.m. and reached Hounslow at 3 p.m.

During the week ending Nov. 5th thirty-nine passengers and 2,588½ lb. of freight were carried on the London-Paris service, and seventeen passengers and 558½ lb. of freight on the London-Brussels service. Ladies' wearing apparel is being conveyed from London to Brussels for sale in the large stores of that city.

THE B.A.T. SERVICE.

The Amsterdam service is still in operation, but last week, owing to weather conditions, no machine left this country for Holland.

BROOKLANDS

A correspondent writes :—

The bad weather has prevented Brooklands pilots from doing much flying during the past week, but some test flights have been made on Vickers "Vimy" and Sopwith machines. The repairing of the motor-track still continues, although it will be some months before cars will be permitted to do anything in the nature of racing thereon.

The Anglo-American Oil Co. have now completed negotiations for the acquisition of Gordon Watney and Co.'s works, which they will equip as a repair depot for their fleet of motors.

Lang Propeller, Ltd., are still manufacturing airscrews and experimenting, although their side lines are furniture and boats.

The Weybridge works of Vickers, Ltd., are now turning out the "Vimy" commercial machines for China, of which a hundred have been ordered. Some experimental work is also being done.

An error was made in the notes published under this heading in the issue of Oct. 22nd, when it was erroneously stated that the film biplane which Martinsyde, Ltd., are constructing was tested on the sea. This machine has not yet left the shops, and alterations are being made to the fuselage.

Martinsyde, Ltd., have lately acquired the sole rights of manufacture, etc., of the "Ivy" motor-cycle, which they will improve and turn out under another name. It was hoped that the machine would be exhibited at the Motor Show.

The Australian Martinsyde "A. S." machine is again ready for more test flights, and is expected to give complete satisfaction as a result of detail alterations to the fuselage, etc. According to rumours, a new Martinsyde racing biplane of small dimensions is to be constructed in the near future, but nothing definite is known at present

The Walton Motor Car Co., proprietors of the A.B.C. aero engine, are exhibiting at Olympia, and are engaged in all kinds of experimental work on motors, motor-cycles, and aero engines.

The Air Navigation and Engineering Co. (Blériot's), of Addlestone, are manufacturing another type of light car besides the "Whippet." This car is known as the "Marlborough." The firm have entirely discontinued their aircraft work for the present.—J. F. S.

LEATHERHEAD.

Mr. W. G. Chapman, the manager of the Leatherhead Motor Works, has bought a D.H.6 biplane with a 90-h.p. Curtiss engine for his own use. After ten and a half hours in the air he is very satisfied with the machine.

A four days' journey was made during the week-end *circa* Oct. 26th, in all some 340 miles, with two hours' flying in a 30-m.p.h. gale. With a pilot he started from Leatherhead for Aldwincle in Northamptonshire and landed in a small field at Leighton Buzzard to ask his way. The next landing was made at Oakham (Rutland), where they stayed the night.

On the next day they flew via Kettering to Aldwincle. It was blowing very hard and very cloudy when they left the latter place. After flying south for one hour and a half King's Lynn in Norfolk was reached. A landing was made at Cambridge thirty-four minutes later, where the night was spent. The following morning they returned to Leatherhead via Chingford and Hendon.

Ten landings were made on the journey. It was not necessary to make any adjustments either to the engine or the machine.

Several flights have been made at Brooklands, where the machine is kept pending the arrival of a hangar at Leatherhead. There is difficulty in finding a suitable landing ground at the latter place. Mr. Chapman has had several inquiries for flights and wishes to take up passengers for short trips, as he hopes to be able to fly the machine himself very shortly.

LONDON

HENDON.—On Thursday, Nov. 6th, Major Draper gave special flights at Hendon on the B.A.T. saloon passenger machine in the presence of visitors from Australia and Spain. Passengers were taken up, including some of the visitors.

AUSTRALIA.

Mr. Sidney Pickles, at the request of the New South Wales Government, is to survey the route between Sydney and Broken Hill for the purpose of establishing an aerial passenger service between those places.

Mr. Sidney Pickles has flown from Sydney to Broken Hill, a distance of 624 miles, in 11½ hours actual flying time.

BELGIUM.

AERONAUTICAL REGULATIONS.

The Belgian Government has now laid down regulations for the control of aeronautics within the frontiers of the country. The importation and exportation of merchandise by air is subject to the same conditions as control the movement of goods by land. Infractions of this order and others controlling aeronautics can be punished by imprisonment for from eight days to one year, or by a fine of from 50 to 5,000 francs. In addition the certificates of the crew of an airship or aeroplane contravening these regulations may be suspended for any period between three months and three years.

Airships and aeroplanes trading in Belgium should be registered in that country and so take on Belgian nationality.

THE ANTWERP AVIATION MEETING, 1920.

In 1920 Antwerp will be for a space en fête. Organised gaiety will regulate the city and its visitors in celebration of the past hidden from the present by the mists of war. All sports will be practised, and among them aeronautics will hold an honoured place. The fevered brow of the intrepid aviator will find solace in the clouds while his gyrations will serve to amuse and instruct the innocent and the guilty alike.

CHILE.

Commander V. Guichard, chief of the French Aeronautical Mission, has arrived at Santiago to form a company to start an aerial service between Santiago and Valparaiso.

DENMARK.

The Danish correspondent of THE AEROPLANE writes :—

THE DANISH AIR TRAFFIC CO.

The two 110-h.p. Le Rhône-engined Avros of the Danish Air Traffic Co. (in preparation) have now made their first public flights by Copenhagen, piloted by Capts. Atkinson and Faber (late R.A.F.). Much delay was caused by the dock strike. The biplanes were erected at the Avedore

artillery aerodrome by Copenhagen, where shed accommodation has been hired for four aircraft. The German aeroplanes, managed by Danish and Sleswig military pilots, are stationed at the other suburb aerodrome at Lundtofte.—E. H.

A Curtiss Flight.

The Naval American pilot, Captain Batts, flew on Nov. 6th from Gothenburg to Copenhagen on the new large Curtiss flying-boat of the Danish-American ice manufacturing millionaire, Mr. Larsen, having carried out exhibition flights in Norway during the summer. The machine started the day before for the Danish capital, and made an intermediate landing at Gothenburg, but ran short of petrol between Kullen Rocks and Helsinore. It was towed safely to Copenhagen by a sailing vessel in spite of the rough sea.

Aerial Flower Transport.

The Bréguet flower flight from Paris to Copenhagen was not carried out on Nov. 6th as destined, as the firm could not get landing permit at the Copenhagen aerodrome from the War Office, nor permission in Sweden; as, however, all the Nizza flowers had been sold in advance in Denmark, Norway and Sweden, the receiving firm will apply again.—Hi.

FRANCE.

The Paris-Melbourne Flight.

M. Poulet, with his mechanic M. Benoist, landed at San Stefano aerodrome, Constantinople, on Oct. 28th. On the following day he left for Konia at 6.30 a.m. and reached that place after a stormy voyage about 4.30 p.m. On Nov. 4th he reached Adana, on Nov. 7th Baghdad, and Nov. 8th Bushire.

He left Bandar Abbas at 5.0 a.m. on Nov. 9th for Karachi, *via* Tscharbar (on the Persian Gulf), which town he passed over at 11 a.m.

A New Prix Michelin.

M. Michelin, who has given generous assistance in the past both to motoring and to aviation, has now written to the Aero Club de France offering a prize of 500,000 francs (normally £20,000) for the aviator or designer of the first aeroplane (1) to rise vertically from the ground, (2) to possess the greatest possible range of speed up to 124 miles an hour, and (3) to land vertically within a radius of five metres.

The demands are high, but one does not doubt that aeronautical genius will solve the apparently insoluble problems.

The Gordon-Bennett Cup.

The Gordon-Bennett Aviation Cup will be competed for in 1920 after a gap of six years. The regulations are now being considered by the Aero Club de France. Rumour states that it will be decided in a cross-country race on this occasion.

A Trans-Mediterranean Competition.

A French correspondent writes :—

Towards the end of the year there will be a competition for a seaplane "Traversée du Mediterranée," starting from Saint Raphael for Tunis or Tangiers—a speed and endurance contest. Details are not yet issued.

Lieutenant de Romanet.

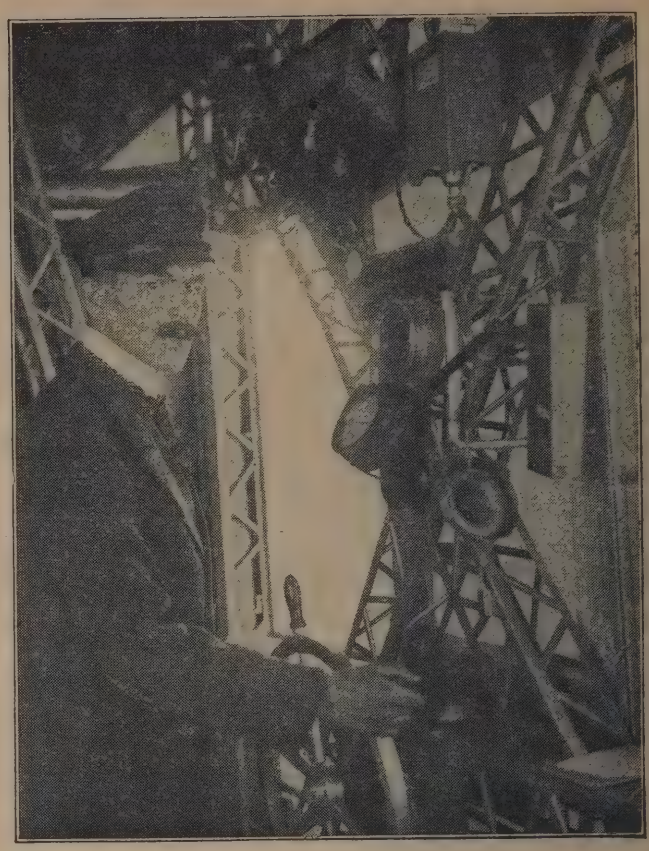
Lieutenant de Romanet, who is now in Madrid, where he delivered a Breguet to the Spanish Government, is representing several French firms in Spain. He is entering for the Mediterranean Race on a Nieuport with a Ratteau Turbine and a "de Mange-Desmons" variable propeller. A Breguet Ratteau machine will probably also be in the race.

A Salon Souvenir.

"L'Air" is producing the official "souvenir" for the Paris Aero Show. There will be no displayed advertisements, but letterpress and photo descriptions of everything exhibited. Arrangements for such descriptive matter should be made through "The Express Publicity Co.," 36, New Broad Street, E.C.2, who are the advertising representatives of "L'Air" for Great Britain.—J. S.

GERMANY.

The Mishap of the "Bodensee."



Mrs. Charles Tower, the wife of the Berlin correspondent of "The Daily Mail," was a passenger in the "Bodensee," which narrowly escaped being wrecked near Berlin on Nov. 2nd, as noted in last week's issue of The Aeroplane.

Mrs. Tower was the only Englishwoman aboard the airship, though there were five women passengers altogether, of whom one was an American. It was said that had there been fewer passengers on board when the "Bodensee" left Friedrichshafen more petrol could have been carried.

The account of the mishap given by Mrs. Tower is as follows :—

"When the 'Bodensee' crashed on the landing-ground at Staaken, 13 miles from Berlin, the engines were disabled. After repeated bumping the airship suddenly rose. There was a moment of extreme peril as we just cleared a shed. Had we fouled it the 'Bodensee' would have been lost.

"We rose steadily to what seemed an immense height. We were in darkness, with snow falling, and it was terribly cold, all the windows being smashed

The navigator of the Hamburg-Amerika Air Liner "Bodensee." (Zeppelin airship.)

"Captain Felming, who behaved splendidly throughout, came to the passengers and explained that the motors were damaged, and enjoined courage, declaring that if everyone kept quiet he would save the ship.

"In two hours, by the extraordinary courage of war-trained mechanics, the engines were repaired. We had so little petrol that only one motor could be used at a time. The captain's compass was damaged by the shock, but after drifting for hours he brought the ship over Staaken again, intending to keep her there till he could land her safely at dawn.

"At midnight, realising that this was impracticable, he decided to drift to a fir wood, where he thought it safe to come down. In three hours he found in the darkness a suitable landing place between Magdeburg and Stendal (60 miles from Staaken. We were then told that if no panic occurred and everyone obeyed orders the ship would come down safely.

"We descended very slowly, Capt. Felming allowing some gas to escape. Finally, between three and four, in complete darkness, we came down on the tops of fir trees which were densely covered with snow. These were fortunately dwarf trees and the ship cushioned on to them and was secured.

"In the early dawn we were removed, huddled into hay-carts by rescuers through the deep snow, to a little village, where we got food and warmth."

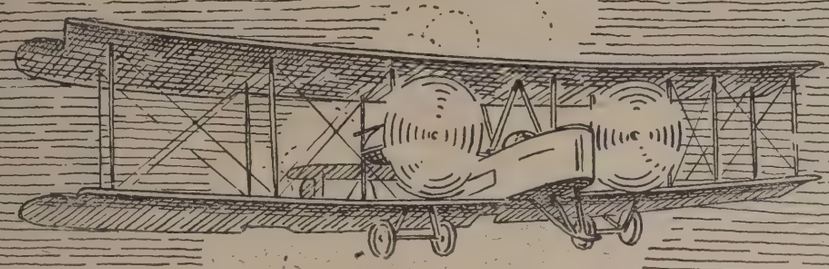
The Danish correspondent of The Aeroplane writes :—

The Fokker Plant.

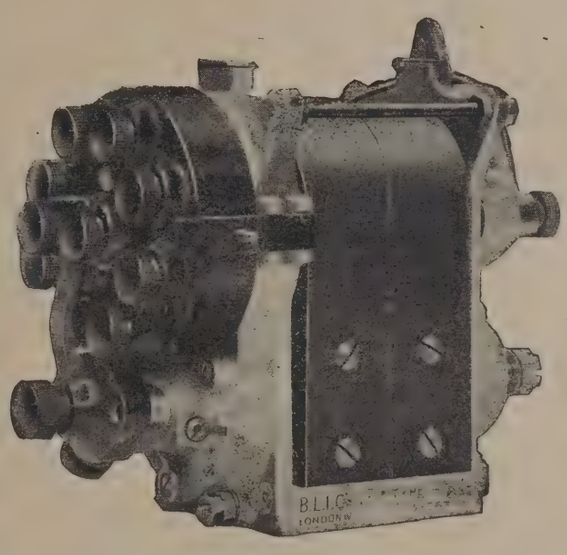
"Flugsport" announces that Unie Bank voor Neederland en Koloniën, being one of the founders of Minjheer Fokker's Dutch "Nederlandsche Vliegtuigfabrieken" aircraft works, has bought the Fokker plant in Schwerin.

The Synchronised Gear Patent.

The Imperial German Court on Oct. 15th decided in the claim of priority of Fokker, *re* firing through the screw in a fighting aircraft, that the synchronised gear was the invention of the L.V.G. Co., patented by it before the war by its former technical director, the well-known Swiss aeroplane designer Franz Schneider.



The Young Idea.



From the advertisement pages of the journal it is interesting to note the request for patrons from youngsters, keen on flying but poor. One derives from the many "situations wanted" of war-pilots that, when offering their willingness in most cases of going abroad, Japan is stated as the favourite place.

Three New Companies.

None of the three last-named new-formed air traffic concerns appear to be of special import either from the

B·L·I·C

THE BRITISH LIGHTING AND IGNITION CO. LTD.

CHESTON ROAD, ASTON, BIRMINGHAM
(Proprietors: Vickers, limited.)

CYCLE & MOTOR-CYCLE SHOW, OLYMPIA.
Nov. 24th to 29th.

You are cordially invited to call and inspect the exhibit of these famous British-built Magnetos on

STAND No. 228.

size of capital or the name of founders, being the Badische Luftverkehrs-Ges.m.b.H. in Baden-Baden, of a joint stock of 100,000 marks (£5,000); Süddeutsche Luft-Reederei in Friedrichshaten, of 50,000 marks capital (£2,500); and Westfälische Luftfahrt Ges.m.b.H. in Hüsten, for aerial transport and flying-school service, with 21,000 marks stock.

ANGLO-GERMAN ALLIANCES.

A note of English-German interests goes through the German Press to the effect that an amalgamation has for the first time since the war taken place by the formation of the Air Traffic Association, Maj.-Gen Brancker partaking from England on behalf of the Aircraft Mfg. Co., and Deutsche Luft-Reederei in Berlin-Johannisthal from Germany. The meeting at the Dutch E.I.T.A. Show of air navigation companies from different countries is apparently referred to.

It is also stated that Vickers did not partake at this occasion, but desire co-operation with German air service firms, wherefore the Dir. of Need. Engl Techn. Handels Maatschappi in Haag has returned from London with orders to prepare Continental working schemes. As, however, the hostility of Vickers to Germany at present was well known, he did not know whether he should get permit to enter and negotiate in Germany, and so acquired the service of a trader with many good agencies in the hardware trade who came in touch with Vickers some time ago in his business.—E. H

GREECE.

H.M. the King of Greece was taken for a flight over Athens on Nov. 8th by Captain Shakespeare, M.C., in the Handley Page aeroplane which was recently flown there for exhibition purposes.

HOLLAND.

A Royal Dutch Aviation Company has been established at The Hague.

The Danish correspondent of THE AEROPLANE writes :—

Writing to the effect that German seaplanes were favoured in Holland during the war, and that both an order for such aircraft was contracted in Germany and the interned specimens bought, while the interned Allied naval aircraft were stored away, "Flugsport" regrets that the field of sales in Holland and its colonies has been lost, since a seaplane built by van Berkel's patent on the light modern Brandenburg lines on its first flight in one day succeeded in flying from Amsterdam to Rotterdam and return. Later a quantity production of these aircraft was started, while of the two best-known German seaplane works, the one has stopped activities completely and the other one has dismissed the total technical personnel (the Brandenburg and Friedrichshafen or Gotha concerns are likely referred to here).—E. H.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

THE CIVIL AERIAL TRANSPORT SERVICES.

One has the best grounds for believing that a strong combine of firms has requested the Government to entrust them with the projected civilian aerial transport services, the postal ones included. This solution was reported soon after the Armistice as what the Government wanted.

A NEW MACCHI AEROPLANE.

A small Macchi 16 is being tested, I hear, at Malpensa, and has proved very nice to handle and fairly speedy.

TO BEAT HIS RECORD.

From Rome I learn that Ing. Marchetti is out to beat his record with a faster Marchetti-Vickers biplane.

THE VIENNA AERO COMMISSION'S WORK.

A Vienna-Bukarest non-stop flight, about 1,400 kilometres, is likely to be tried shortly as part of the Vienna Aero Commission's work. Prague, Warsaw, and Pilsen are being made into "sub-centres" (pardon the term) of this mission.

A ROME AERO SHOW.

An aero show is mooted for 1920 at Rome. It is not yet decided if it is to be international.

THE NAPLES SEAPLANE RACE.

The seaplane races arranged for October at Naples are postponed till next spring. Luckily the Circuit of Sicily took place before the prohibition of flying was pronounced

A NEW AVIATION WEEKLY.

A new weekly in connection with the movement started at Milan among the ex-combatants (pilots) to protect the sport and trade against all comers has been born at Milan. The first copies to reach me are just what is needed, and the editor, Sig. Attilio Longoni, has everyone's good wishes. The paper is "La Gazetta dell'Aviazione," published at Via Torino No. 10.—T. S. H.

COMPETITIONS IN 1920.

The Coupe Schneider will be run over a course in 1920 at Venice, a few days before the opening of the automobile meeting. Another aviation meeting to be held about the same time will include (1) a speed trial for machines wishing to qualify for participation in a flight of 1,000 kilometres without landing and with a stated useful load, and (2) a flight of 1,200 kilometres for machines with two or three motors.

NORWAY.

The Danish correspondent of THE AEROPLANE writes :—

THE UNITED SARDINE FACTORIES' SEAPLANE.

A 200 h.p. Benz-engined Lübeck-Travemünde seaplane, built after the Armistice, was supplied to a company in Norway for fishing inspection and got delivered by air. It was flown to Bergen with an intermediate landing in Denmark by the pour-le-merite Naval pilot, Commander at the Zeebrügge Air Station, Capt.-Lieut. Christiansen. Director Danielsen, of "United Sardine Factories," its owner, has, at the end of a successful flight to the most northern part of Norway of 2,500 kilometres distance, made the first public announcement of the use of the company's new acquisition, reading to this effect :—

"We bought the seaplane in order to examine the various fishing grounds and to get more raw material than hitherto, and to find out the lack of same. We also acquired the seaplane for express service in our business, as the fishing-grounds are scattered far about, and we can thus get far and inspect most places in a relatively short time. This will facilitate the inspection work much, and the heads can more often visit the branches.

"The experiment is the first, and, so far, the only one in Scandinavian fishing; but we have hitherto had too few chances of employing the seaplane to be able to state the uses to which it can be put, as it rained here for the first six or eight months after it was bought. Yet we have ascertained that the seaplane is strong, and attains a speed of 120 kilometres per hour. A dismantling after every 30 hours' service has hitherto been considered necessary, but this seaplane has flown satistactorily for 150 hours.

"Two passengers can be carried, as well as the pilot. I partook in the northern flight, which was partly carried out in very rough weather. We have now just finished a shed at the Ask Island for two seaplanes with future acquisitions in view, and are able to receive flying visitors. If the weather permits, I will fly this autumn on the seaplane to Christiania, and would appreciate it if there was a shed there to protect the machine against rain or frost."—HI.

POLAND.

The Danish correspondent of THE AEROPLANE writes :—

"Flugsport" reports in its issue of Oct. 29th that Polish commercial concerns are negotiating with the British Handley Page Co. *re* the technical organising of the air line Danzig-Warschau-Krakow. About one and a half tons should be transported in each flight, with the sanction of the Warschau Postmaster. In support of this plan a Poland Aero Club was to be formed at the end of October.

"Flugsport" reports further that the Poland Trade Chamber in Genève (rue Etienne Dumont, No. 22) is contemplating the plan of an aerial service for sending mail and dispatches from Poland across Tschecko Slowakei and Austria, and that the plan is immediately before realising.—E. H.

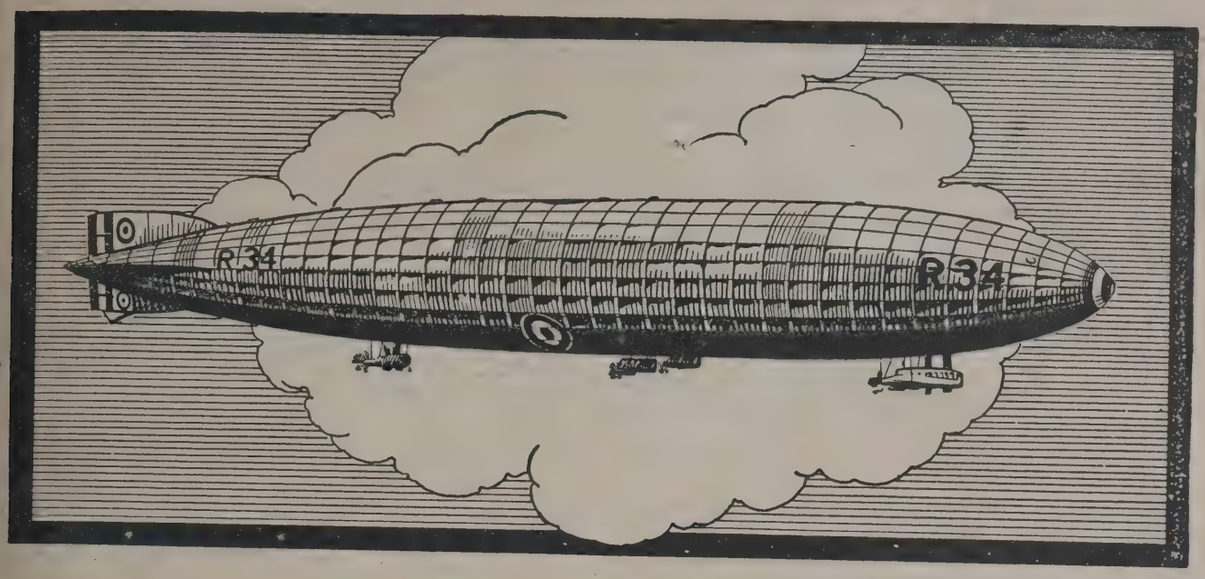
SPAIN.

THE LOOPING RECORD.

M. Fronval, a French aviator, made a record number of loops at the "Four Winds" aerodrome, near Madrid, on Oct. 28th. Reuter states that he looped 624 times in a flight lasting 2 hr. 49 min. and 9 sec. The record was hitherto held by an American who made 455 loops in one flight.

The feat is of the nature of a record for falling off a horse a great number of times in a short space of time without breaking one's neck.

SWEDEN.



The Danish correspondent of THE AEROPLANE writes :—

THE HANDLEY PAGE FLIGHT RESUMED.

The Handley Page biplane which was damaged in a forced landing from stop of one motor in the start of a flight from the Army aerodrome at Lillestroem by Christiania, early in the autumn, has now been repaired. Various prospective buyers came forward. After successful trial flights by Captain Stewart, the pilot, the Scandinavian circuit was continued to Stockholm, whence the biplane will return to England *via* Copenhagen and Holland. The passengers were Capt. Stewart's wife and Capt. Meisterlin and wife.—HI.

SWITZERLAND.

A telegram from Berne on Nov. 7th stated that a provisional air convention between Great Britain and Switzerland was signed on Nov. 6th. An official luncheon was given to the British delegation, after which Col. Beatty made a flight in a Swiss machine over Lake Thun.

"Cordial Appreciation" of the Skill and Energy———

"Sincere Congratulations to All Concerned"————————

In these words do the Lords of the Admiralty express their opinion of the firm which produced the engines which enabled R.34 to make her journey across the Atlantic and back.

ADMIRALTY, Nov. 1st.

To be retired.—Lt. T G. Southwood (Capt., R.A.F.), Nov 1st.

MILITARY.

WAR OFFICE, Nov. 3rd.

TERRITORIAL FORCE.—INFANTRY.—6TH BN. SCOT. RIF.—Sec. Lt. J. S. Monteith to be Lt., and to remain seconded (R.A.F.). May 1st; Sec. Lt. E. Colvill to be Lt., and to remain seconded (R.A.F.), May 1st.

14TH BN. LOND. R.—Sec. Lt. W. W. Jones, M.C., to be Lt., and to remain secd. (R.A.F.), Oct. 26th, 1918 (substituted for that which appeared in "Gazette" of Jan. 25th).

WAR OFFICE, Nov. 5th.

REGULAR FORCES.—ESTABLISHMENTS.—R.F.C.—Mil. Wing.—Gen. List.—Sec. Cpl. H. V. D. Read, from R.E., to be temp. Sec. Lt., March 24th, 1918.

INFANTRY.—R. Muns. Fus.—Lt.-Col. and Bt. Col. A. M. Bent, C.M.G., on completion of his period of service in comd., is placed on the h.p. list, and retains his present appt. with the R.A.F., March 30th (substituted for the notification in the "Gazette" of March 29th).

WAR OFFICE, Nov. 6th.

REGULAR FORCES.—INFANTRY.—Suff. R.—Lt. J. E. Gurdon, D.F.C., retires on ret. pay on account of ill-health caused by wounds, Nov. 7th.

Linc. R.—G. G. Edgell (temp. Lt., R.A.F.) to be temp. Lt., Feb 16th.

WAR OFFICE, Nov. 7th.

REGULAR FORCES.—ESTABLISHMENTS.—R.F.C.—Mil. Wing.—The following appointment is made:—Flying Officer (Obsr.).—Lt. J. A. Hollis (E. Yorks. R.), Dec. 12th, 1916.

ROYAL REGIMENT OF ARTILLERY.—Lt. J. C. Moolman, M.C., relinquishes the actg. rank. of Maj. on ceasing to comd. an Anti-Aircraft Batt., May 25th.

INFANTRY.—Wilts. R.—Temp. Sec. Lt. C. B. Percy resigns his commn. on appointment to R.A.F., Aug. 21st, 1918.

MEMORANDUM.—The notification in "Gazette" of March 20th, 1918, regarding Lt. G. Iredell, under "Supplementary to Regular Units or Corps, Royal Flying Corps, Mil. Wing," is cancelled.

REGULAR FORCES.—OVERSEA FORCES.—CANADA.—New Brunswick R.—Temp. Lt. G. R. Harrison ceases to be secd. for duty with the R.A.F., Oct. 2nd.

WAR OFFICE, Nov. 8th.

REGULAR FORCES.—COMMANDS AND STAFF.—The following appointment is made:—

PERSONAL STAFF.—A.D.C.—Lt. A. F. Brooke, 10th Hrs. (Capt., R.A.F.), July 3rd, 1918 (substituted for notification in "Gazette" of Aug. 27th, 1918).

ROYAL REGIMENT OF ARTILLERY.—R.G.A.—Maj. and Bt. Lt.-Col. C. A. Mortimore, D.S.O., R.F.A., to be actg. Lt.-Col. while empld. as Anti-Aircraft Comdr., June 27th.

Lt. (actg. Capt.) W. E. Vaudrey, M.C., to be actg. Maj while empld. as Liaison Officer, R.A.F., from July 9th, 1918, to Feb. 13th

AIR FORCE.

AIR MINISTRY, Nov. 4th.

R.A.F.—The follg. are granted Perm. Commns. in the R.A.F. in the ranks stated, with effect from Aug. 1st:—Flt. Lt. E. L. Williams, M.C. (A. and S.); Flying Officer A. C. Collier (A.).

The notification appearing in the London "Gazette" of Aug. 1st appointing the following officers to Perm. Commns. is cancelled:—Capt. M. O. F. England (O.), Capt. C. J. Galpin, D.S.O. (A. and S.), Capt. E. A. Jackson (T.), Capt. W. S. Newton Clare, M.B.E. (Ad.). Capt. C. S. MacNab (S.O.), Lt. F. M. I. Watts, M.B.E. (T.), Lt. R. B. T. Hedges (A.), Lt. W. Myers, M.C., D.C.M. (S.O.), Lt. J. M. McEntegart (T.).

The following temp. appointments are made:—

Staff Officers, 2nd Class.—(Q.).—Lt. (Hon. Maj.) C. A. Cuthill, and to be actg. Maj. while so empld., from June 21st, 1918, to Nov. 25th, 1918. (Air).—Flt. Lt. W. B. Callaway, A.F.C., Sept. 1st; (T.).—Sqdn. Ldr. F. J. Rutland, D.S.C., A.M., Sept. 1st; (P.)—Sqdn. Ldr. G. H. Thomson, O.B.E., Sept. 1st.

Staff Officer, 3rd Class.—(Air).—Flt. Lt. W. P. Groves, Sept. 1st; Flt Lt. A. W. Mylne, Oct. 4th; (T.)—Flying Officer P. A Simmons, Sept. 15th; (P.).—Flt. Lt. H. V. German, Sept. 25th; Flying Officer G. D. Ashby, Sept. 26th; (Q.).—Flt. Lt. R. S. Sugden, A.F.C., Sept. 27th.

Staff Officer, 4th Class.—(T.).—Flying Officer J. R. R Harvey, Sept. 22nd.

FLYING BRANCH.—Sqdn. Ldr. (actg. Wing-Cmdr.) R. Grey relinquishes the actg. rank of Wing-Cmdr. on ceasing to be empld. as Wing-Cmdr. (A.), Oct. 8th.

Capt. W. W. Carey-Thomas, M.C., is graded for purposes of pay and allowances as Maj. while empld. as Maj. (A.), from May 1st to Sept. 29th

Capt. L. C. W. Trend is graded for purposes of pay and allowances as Capt. while empld. as Capt (A. and S.), from May 1st to July 25th.

Lt. R. E. Butler to be actg. Capt. while empld. as Capt. (A.), from Nov. 1st, 1918, to April 25th (substituted for notification in "Gazette" of Oct. 21st).

Flying Officer V. M. C. B. de Sarigny to be actg. Flt. Lt. while empld. as Flt Lt. (K.B.), from Aug. 1st to Oct. 14th

The following Lts. are graded for purposes of pay and allowances as Capts. while empld. as Capts. (A.):—H. R. Gardner, to June 1st; W. D. Knibbs, to Aug. 31st; H. B. Russell, to July 31st (May 1st).

Flying Officer (actg. Flt. Lt.) F. Lord, D.F.C., relinquishes the actg. rank of Flt. Lt. on ceasing to be empld. as Flt. Lt. (A.), Oct. 8th

Flying Officer A. V. Burbury, M.C., to be Flying Officer (A.), from (S.O.), Oct. 7th.

Flying Officer A. F. Lang to be Flying Officer (O.), from (T.), Aug. 1st (substituted for notification in the "Gazette" of Sept. 26th).

Sec. Lt. (Hon. Lt.) G. L. Parkinson, M.C., to be Lt., June 22nd, 1918.

Pilot Officers to be Flying Officers.—C. H. W Clarke, May 28th; V. M. Mitchell, July 24th; J. L. Booth, Oct. 1st.

Sec. Lt. G. A. Thompson (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt. (A.), March 27th.

Lt. D. A. A. Shepperson (Lt., Som. L.I.) relinquishes his commn. on ceasing to be empld., and is granted the rank of Capt., Sept. 10th (substituted for notification in the "Gazette" of Sept. 19th).

The following relinquish their commns. on ceasing to be empld.:—Sec. Lt. G. R. Harrison (Lt., New Bruns. R.), Oct. 2nd; Capt. G. E. Chadwick, M.C. (Capt., E. Lan. R.), Oct. 12th; Lt. A. R. Walker (Lt., Gord. Highrs.), Oct. 13th; Capt. P. E. M. Le Gallais, A.F.C. (Lt., R. Suss. R.), Lt. G. W. T. Pereira (Lt., Som. L.I.), Oct. 15th; Capt. E. A. Packe (Lt., Oxf. and Bucks. Magnetos, cylinders, accumulators, carburetters, pistons, 4 iron winches, wooden cases, nails, tools, plugs, exhausts, propellers, signal pistols, aero photographic apparatus, wiring plates, rope, tyres, inner tubes, wheels, washers, axles. Together with a large and varied assortment of ELECTRIC APPLIANCES, comprising:—

Switches, wireless installations, amplifiers, rear-lights, batteries, dry cells, torchlights, etc., and a large quantity of NEW CLOTHING AND BOOTS, comprising: Flying suits (fur lined), flying boots (rubber soles), goggles, balaclava helmets, crash helmets, also a HANDLEY PAGE AEROPLANE, fitted with two 400-h.p. Liberty engines.

Admission to Sale by Catalogue only. Further particulars and catalogues to be obtained from the Auctioneers, Messrs. BOWLER & BLAKE, at their offices, Fratton Bridge, Portsmouth, Phone 4613.

NOTE.— For particulars of other Government Property for sale see "SURPLUS" price 3d. at all bookstalls; or by quarterly subscription of 2 - post free, payable in advance to the Director of Publicity, Ministry of Munitions, Whitehall Place, London, S.W.1.

Steels that Fly.

Thousands of miles were flown during the war by aeroplanes with engines in which the Edgar Allen Special Alloy Steels figured. By scientifically studying the result of heat-treatment on these steels, speed with safety has been attained to a degree formerly deemed impossible. For full particulars of

Edgar Allen's

Steels for Aircraft and Motor Cars

See Catalogue D. This gives instructions for use, details of tests fulfilled, charts, valuable reference tables, etc.

THE ROYAL AERO CLUB NOTICES.

"DAILY EXPRESS" £10,000 PRIZE.

A meeting of the Advisory Committee on the "Daily Express" £10,000 Prize was held at the Club on Tuesday, Nov. 4th, 1919, at 3 p.m.

Present:—

Royal Aero Club: Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S. (in the Chair); Lieut.-Col. F. K. McClean.

Society of British Aircraft Constructors: Capt. P. D. Acland.

Air Ministry: Lieut.-Col. W. O. Raikes.

"Daily Express": Major W. E. G. Murray.

Lieut.-Com. H. E. Perrin (Secretary) (Royal Aero Club).

The main features of the Competition were decided and the drawing-up of the Regulations was referred to the Technical and Competitions Committee.

SPECIAL COMMITTEE MEETING.

A special meeting of the Committee was held on Wednesday, Nov. 5th, 1919, when there were present:—Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S. (in the Chair), Mr. Ernest C. Bucknall, Squadron-Leader T. O'B. Hubbard, M.C., R.A.F., Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie, and the Secretary.

ELECTION OF MEMBERS.—The following New Members were elected:—

Lieut. Harold William Russell Banting.

Cecil Thomas Chandless Chandless.

Geoffrey Kitchin.

John Frederick William Lennard (late Major, R.F.A.).

Arthur Newman (late Capt., R.A.F.).

Flight Lieut. Sydney Gerald Nicholson, R.A.F.

TEMPORARY HONORARY MEMBERSHIP.—Major Melvin Adams Hall, D.S.O. (Air Attaché, American Embassy), was elected a temporary Hon. Member of the Club.

FEDERATION AERONAUTIQUE INTERNATIONALE.—Lieut.-Col. Mervyn O'Gorman attended and presented a report of the Conference of the Fédération Aéronautique Internationale held at Brussels on Oct. 22nd, 23rd, and 24th, 1919.

On the motion of the Chairman, seconded by Mr. Ernest C. Bucknall, a unanimous vote of thanks was passed to the delegates who attended the Conference on behalf of the Club.

PRESENTATION TO SR. JANELLO.—It was decided to make a presentation to Sr. Janello, in recognition of his performance in the Schneider Race at Bournemouth, and the form of the presentation was to be considered at the next meeting of the Committee.

LOG BOOKS FOR PILOTS AND AIRCRAFT.—A letter was read from the Air Ministry asking for a representative of the Royal Aero Club to attend a meeting to discuss the proposed new log-books for pilots and aircraft, and the Secretary was instructed to represent the Club.

FEDERATION AERONAUTIQUE INTERNATIONALE.

REPORT OF THE

CONFERENCE AT BRUSSELS ON OCT. 22ND, 23RD, AND 24TH, 1919.

A Conference of the Fédération Aéronautique Internationale was held at Brussels on Oct. 22nd, 23rd, and 24th, 1919.

In the absence of Prince Roland Bonaparte, who was ill in Paris, M. Jacobs, President of the Aero Club of Belgium, was voted to the Chair.

The following countries were represented at the Conference:—

America, Belgium, Brazil, Denmark, France, Great Britain, Holland, Italy, Japan, Norway, Portugal, Sweden, Switzerland

The delegates who attended on behalf of Great Britain were:—

Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie, Lieut.-Col. Mervyn O'Gorman, C.B., Mr. Harold E. Perrin (Secretary).

The principal business of the Conference was the revision of the Statutes and Regulations of the Fédération

The revision of the Statutes and Regulations had been under the consideration of a special committee under M. Surcouf. The report of this committee, which was presented to the Conference, had been fully considered by the Royal Aero Club, and the suggestions put forward by the Club were in nearly every case accepted.

As regards the Schneider Cup, the decision of the stewards of the meeting in not awarding the trophy to Italy was upheld. The British delegates, on behalf of the Royal Aero Club, agreed to a suggestion that the race for 1920 should be held in Italy, and, with the sanction of the Aero Club de France, this was approved by the Conference. The Royal Aero Club also agree to loan the Schneider Trophy to the Aero Club of Italy for exhibition on the occasion of the race.

Six Commissions were appointed, viz.:—

1. International Review of the Fédération Aéronautique Internationale. Secretary: M. Blondel la Rougery.
2. Medical. Secretary: Dr. Van Kulften Galthé.
3. Aerial Touring. President: M. Mercanti.
4. Technical. President: Lieut.-Col Mervyn O'Gorman, C.B. Secretary: Lieut.-Col. Alec Ogilvie.
5. Aerological. President: M. Jacobs. Secretary: M. Jaumotte.
6. Aeronautical Laws. President: M. Clunet. Secretary: M. Imbrecq.

The question of international records was fully considered by the Conference and the revised Regulations to take effect on January 1st, 1920, will be issued shortly.

THE FLYING SERVICES FUND.

(Registered under the War Charities Act, 1916.)

ADMINISTERED BY THE ROYAL AERO CLUB.

For the benefit of Officers, Non-commissioned Officers and Men of the Royal Air Force who are incapacitated while on duty, and for the widows and dependents of those who are killed or die from injuries or illness contracted while on duty.

Hon. Treasurer.—The Right Hon. Lord Kinnaird.

Committee.—H.R.H. Prince Albert, K.G. (Chairman), Mr. Chester Fox, Squad. Leader T. O'B Hubbard, M.C., R.A.F., Squad. Leader C. E. Maude, R.A.F., Group Capt. C. R. Samson, C.M.G., D.S.O., R.A.F.

Secretary.—H. E. Perrin.

Bankers.—Messrs. Barclays Bank, Ltd., 4, Pall Mall East, London, S.W.1.

GRIPOLY BELTING

Solid Woven with triple-twisted indestructible edges

Let us know your requirements and we will advise you as to the best type of "GRIPOLY" for your needs.

Get the most out of your Machinery

by using a belt which does not slip or stretch and which *grips*. A slipping belt in your factory is as bad as a leaking petrol tank in your motor car. "Gripoly" has proved itself under test to be the most efficient all round belting. It does not stretch or slip; it resists heat, damp, grease, friction and guide forks as no other belting can. Have the best belting and get the utmost power from your machines.

LEWIS & TYLOR LIMITED,
GRANGE MILLS, CARDIFF, and 51, Gracechurch St., London, E.C.3.

ON THE DISPOSAL BOARD AND THE S.B.A.C.

It seems very nearly time for somebody in a public position to take an interest in the allegatings of the Aircraft Department of the Disposal Board. One can find no word so well suited to the curious behaviour of that department as the equally curious Irish colloquialism which one has used, a word which implies extraordinary antics which give rise to allegations.

So far as one has been able to find any official reason for the existence of the Disposal Board it exists for the purpose of saving the taxpayers' money by selling surplus war material for the greatest possible sum. Few who have had any dealings with the Board have much belief in its ability to fulfil that function, for its policy, at any rate so far as aircraft are concerned, seems to be to hold out for an absurdly high price until the goods under discussion have been worthless, and then break them up for scrap.

Judging by reports from France published recently in the "Morning Post," this custom is not peculiar to the Aircraft Department, for one reads of tons upon tons of tinned meat, milk, jam, and other edibles being left exposed to the weather until the tins rust through and the contents rot. And all the while the people of France are crying out for cheap food.

Incompetence or Self-Interest.

Such policy, custom, habit, action, or inaction may be due to either of two reasons, firstly to sheer incompetence, or secondly to ill-considered selfishness. In the first case it may be explained by the fact that the few competent people who were originally employed in the Disposal Board have now found adequately paid positions in commercial employment and that consequently only the utter incompetents are left behind. Which is very much as it was during the war when almost all the competent technical people were employed by the aircraft constructors and only the grossly incompetent (with a few brilliant exceptions) were left for the Technical Departments of the Air Board, and afterwards for the Technical Department, Air Group, Ministry of Munitions.

In the second case the explanation seems to be that if all the surplus aircraft and material were sold off at once for a reasonable price all the officials who are now drawing salaries—small in amount, but lavish when judged by results—from the Disposal Board would find themselves cast forth on a cold and unsympathetic world to earn a living. And as most of them are probably painfully cognisant of their own incompetence it is natural, if not honest, that they should keep the surplus stock as long as possible so that the evil day when they find their occupation gone may be postponed to the uttermost limit.

This is poor policy in reality, for by the time the taxpayer is roused to action the Disposal Board will have earned such a bad name that if a man is known to have been employed by the Board it will be impossible for him to get a job anywhere. To have been a Disposal Board official will for a man be several degrees worse than it is for a woman to have been a Whitehall flapper It would be a far better thing to do, so far as these men are concerned, if they resigned *en masse* and became bricklayers' labourers or adopted some equally honest and useful profession.

Some Quaint Aircraft Deals.

The actions of the Disposal Board in relation to aircraft appear to be quaint beyond all measure and entirely without co-ordination.

For instance one hears of quite obsolete but still useful machines being sold at very moderate prices to individual pilots who have done remarkably well with them in single-handed "joy-ride" ventures. In one case a pilot bought a 1915 type machine for a few hundreds of pounds, cleared well over £1,000 in passenger fares, and then sold the machine for about what he gave for it. But against this one hears of a manufacturer who wanted an obsolescent machine for a special purpose in a very great hurry and was forced to pay several thousands of pounds for it. When he got it he found that the engine was unfit for use, though it was sold under a guarantee that it was in perfect flying order. Consequently he had to buy a brand-new engine for it from the makers.

Against this Sweden can buy brand new Brandenburg seaplanes for £200 complete, delivered in Sweden.

It seems that the Disposal Board is holding out for absurdly high prices for all machines which are merely obsolescent, and that even where actually obsolete machines are concerned as soon as there appears to be a demand for them the price is raised so that they become unsaleable.

Yet at the same time as these high prices are being asked for certain machines others of the same make and type are being broken up, or "reduced to produce" as it is called, and sold as firewood and scrap metal. This breaking-up process, incidentally, gives perfectly useless employment to a lot of people who ought to be at work producing something of value.

How "Scrap" Is Made.

One heard recently of a pilot who smashed a certain considerable part of his machine in an accident, and went straight off and bought the whole of that part, plus some more, off a Disposal Board scrap-heap for a few shillings. Yet the part which he had bought had only become scrap through breaking up a perfectly good flyable machine which was worth some hundreds of pounds if sold as a going concern.

Even in the breaking-up process no intelligence whatever seems to be shown. For example, a petrol tank out of an aeroplane is always a receptacle which will hold liquid and could be sold as such, either for use in motor-boats, or for storing petrol or oil in garages, or for holding the domestic paraffin supplies in houses in the country. Thousands could be sold through local ironmongers and garages.

Yet no attempt seems to be made to sell them in this way. When they are taken out of the machines they are hammered out of shape to make sure that they cannot be used. And so tanks which cost pounds to make—apart from the price paid for them by the Ministry of Munitions—are sold for a few pence as scrap tin or brass or aluminium.

The Waste of Power-Plants.

Engines are treated in a similarly imbecile way, and as the cost of an engine was so high the scandalous waste is far greater. If the maker or owner of an aeroplane wants to buy a first-class engine, such as a 1916 or 1917 Rolls-Royce, or any other engine of fairly modern type, he is asked to pay a price which is very nearly as high as the maker's list price for the very newest type.

Naturally the sales at such prices are very small indeed, and so the engines are left in store to become more and more obsolete. In many cases they are badly housed and rust is eating into the valves, springs, water-jackets, and other parts, with the result that in a year or so it will cost as much to overhaul these engines and to replace the deteriorated parts as it will to buy new engines.

In other cases, where the officials of the Disposal Board have made up their minds that certain types of engines are obsolete, instead of selling the engines at a "job lot" price so that they can be adapted to some useful purpose, such as driving motor-boats, or driving dynamos for lighting country houses, or even for use on slow, low-powered aeroplanes, the engines are condemned to be broken up with hammers and sold as scrap metal.

One heard not long ago of an astute person who bought several such engines at a matter of ten or fifteen pounds apiece as scrap metal, plus a couple of pounds per engine to the gentlemen who were supposed to break them up for the courtesy of missing them with their hammers in the breaking-up process.

All sorts of other valuable parts of aircraft seem to be treated in the same way. Seaplane floats, which would do excellently for replacements, are stove in and sold as firewood. It is said that flying-boat hulls of the older types, which would make quite good pleasure craft on lakes and big rivers here and abroad, though perhaps unfit for sea work, are similarly broken to pieces.

The whole business seems to be managed with the idea of selling as little as possible and making what is not sold unfit for use. Though one admits that intelligent officials here and there are proving themselves to be first-class salesmen.

Our Priceless Opportunity.

If nothing more than mere waste were involved in this astonishing policy it would be bad enough. But far worse than the mere waste of money and material is the loss of the priceless opportunity which exists at the moment for pushing forward the progress of Civil Aviation and for getting a footing in foreign countries with British aeroplanes. Surely it is the duty of the Society of British Aircraft Constructors to step in and stop the waste, and to convert all this surplus war material into useful propaganda.

Almost all the obsolete and obsolescent machines and engines are quite fit to fly. Therefore, why not fly them? Especially should they be flown abroad, where less is known about the fast and comfortable modern machines of to-day than is know elsewhere.

Fields for Enterprise.

Australia and South Africa, as is well known, are keen on starting "joy-rides" and regular air lines. Already small private ventures, equipped with such ancient craft as D.H.6s and B.E.2es, are at work and doing well. Why not send them dozens of somewhat newer and better machines and sell them cheap? There are hundreds of pilots in each country, and thousands of mechanics.

Canada has some ten or twelve thousand pilots, nearly all of whom are keen on flying if they can get machines at a price. Ancient Curtisses with 90 h.p. engines are being planted on them by Americans or pseudo-Canadians. Why not let them have D.H.4s, R.E.8s, Sopwith "1½ strutters," Avros, and other less antiquated types, at a price? It would be better than scrapping such machines.

Also, Canada is a mass of water ways. One can travel from Halifax, Nova Scotia, to the foot-hills of the Rockies and to Hudson's Bay in a seaplane or flying-boat and never be out of gliding distance of a safe alighting place on water. Why not send flying-boats and seaplanes to Canada?

The Argentine Republic is made for flying. Its great plains and rivers afford perfect conditions for thousands of miles. The Argentinos are rolling in wealth, and they have been infected with a love of flying by French and Italian aeronautical missions which have visited them since the Armistice, while we have been represented by about two British machines and pilots. Can we not send some of our modern surplus machines to Argentina instead of leaving them to rot?

Is there nobody in the S.B.A.C. who has enough influence with financial people in the City to find the money to buy up a few tens of thousands of pounds worth of surplus aeroplanes from the Disposal Board and send them with a few capable business men and squads of mechanics to these and other countries which are crying out for aviation? Or is it that the S.B.A.C. does not want the surplus stock sold and would rather see it rot away at the cost of millions of pounds to the country?

A Question to the S.B.A.C.

Some people believe that such is the case. One has been told that the prevailing idea among the aircraft firms in the S.B.A.C. is to prevent obsolete and obsolescent machines from being sold cheap, for fear lest they should spoil the market for modern machines at the high prices made necessary by labour conditions to-day. It is even said that the apparently imbecile policy of the Disposal Board in holding out for absurdly high prices and scrapping usable material is to a large extent due to an understanding with the S.B.A.C.

One has too much respect for the business acumen of the leading men in the S.B.A.C. to believe that such is the policy of the Society, but it would be well if the Council of the Society were to investigate the facts and discover whether any of its members are instigating this policy in the Disposal Board. Will the Council do so, and make an official announcement accordingly?

Propagating Civil Aviation.

Surely it must be evident that the best way of propagating Civil Aviation is to make it popular first. This can best be done by making it as cheap as possible at the beginning. High prices will come later.

One has seen personally from their beginnings the rise of three great industries, the Cycle Industry, the Motor Industry, and the Aircraft Industry. History has repeated itself in every case. Invariably there has been an attempt to maintain high prices artificially, and equally invariably the highest prices and the greatest boom has been reached when there was the greatest supply of cheap machines. The bigger the sale of cheap machines the bigger the sale of high-priced machines. Which is quite natural.

The Progress of Prices.

The youth who has a cheap bicycle wants a better

one. Then he wants a motor bicycle. When he has got that—and a little more money—he wants a side-car, and then the eternal feminine comes into the question, which always means more expense.

After the side-car comes a cycle-car. That is followed by a "ten-twelve" or a "twelve-fifteen" two or three seater. After a while the light car becomes a bore and he wants more solidity and more speed, and acquires an "eighteen-twenty-two," with a sporting four-seater body. And finally, if the money can be got, he gets to the "twenty-eight-eighty" class and a saloon body.

Or he starts with a Ford and graduates to a Napier, or Rolls-Royce, or Sunbeam, or Siddeley. Yet is anybody foolish enough to believe that the astounding sale of Fords affects the sale of the more expensive cars adversely? Does it not, on the contrary, very much extend the sale of higher-priced cars, simply because the man with money cannot afford to be seen in a cheap car, and because the man with a cheap car always wants a more expensive one?

Similarly in aviation, the half-guinea "joy-ride" at Blackpool becomes the cross-country "stunt" from Blackpool to Manchester or *vice versa*. The short cross-country trip becomes the adventure of an aerial journey to Paris or Brussels or Amsterdam. The adventure becomes in time a habit, and so we shall develop the passenger air lines of the future to Berlin and Petersburg, Rome and Cairo, Bordeaux and Madrid, and ultimately to India, Australia, and the Cape. But it will be the half-guinea joy-ride which has educated the passengers on those lines.

Price as an Educator.

Just in the same way the cheap aeroplane will, if given the chance, educate the buyer of the bigger and better machines. The Canadian sportsman who buys an obsolescent F.B.A. or N.T. boat and finds it a useful as well as an amusing way of travelling about his country will ultimately buy the latest product of the Gosport, or Saunders, or May, Harden and May boatyards. The inspector or trader who uses Disposal Board seaplanes for journeys on the Canadian rivers will at a later stage use the latest Faireys and Shorts. The Australian sheep farmer, the Argentine *ranchero,* or the Canadian corn or cattle man who starts inspecting his out-stations on a B.E.2e or a D.H.6 will soon want the latest thing in Aircos, Avros, Blackburns, Martinsydes, Sopwiths, or what-not.

The men (as usual embracing women) are there and the money is there waiting to buy aeroplanes—at a price—if only somebody will set about selling them in the right way. The aeroplanes in thousands are ready for sale.

A Business Proposition.

If the S.B.A.C. is wise it will form a huge co-operative selling organisation to plant all the Disposal Board's surplus aeroplanes all over the world, irrespective of make and at the lowest possible price. Then and then only will Civil Aviation propaganda be propagated as they should be. All the Air Ministry's well-meant propaganda are so much waste paper unless based on accomplishments.

The only aerial propaganda worth having are those which are demonstrated by aeroplanes in being. Between now and next March is the time for organisation. It is to be hoped that next year will see the British Aircraft Industry convincing the world of its ability to supply all the aircraft needed at prices which make flying possible.—C. G. G.

An aerial photograph showing the Houses of Parliament, St. Thomas' Hospital, and Westminster Bridge. Westminster Hall, formerly the principal Law Court of the realm, is in the centre foreground. The photograph was taken from an Airco biplane.

REFLECTIONS ON THE MOTOR SHOW.

Except for that body of enthusiastic amateurs whose automobile tinkering habits provide a large portion of the motor trade with the wherewithal to pay super-tax, and whose activities are the means of keeping the cost of motoring at a level well beyond the means of those to whom motoring could be of real use, no one nowadays pays much attention to the motor Press.

However, its bright burblings provide a fund of constant amusement, and its insistence on the influence which aircraft practice has had on the design of automobiles has seemed to call for an investigation, for which the present show at Olympia has afforded an opportunity, though a very uncomfortable one.

Nevertheless, at show time, the motor trade does abandon some of its habitual discourtesy to those of an inquiring turn of mind but of limited purse, and thus the honest poor may then occasionally discover the truth undisturbed by violence, either physical or verbal.

Be it at once confessed the motor Press has in this matter of aircraft influence on design founded its statements on fact.

There can be no doubt that one well-known aero-engine has distinctly influenced the designs of that firm, which, having made that engine in quantity during the war, has now planted a speaking likeness of it into a chassis by way of producing their 1920 model. But, with a few honourable exceptions, aero-engine practice seems to have had its greatest influence on the designs of the advertising departments of the motor trade, which, perhaps, is where most of its designing is done.

Overhead valves, overhead camshafts, wonderful pistons of costly and fragile construction, and a lavish use of aluminium—all excusable enough in an engine which has to develop one steady horse-power for every three pounds of weight—are here employed to advertise engines which may occasionally develop one horse-power for every eight pounds during some very small fraction of their working life, with no discernible reason other than that of assisting in the transference of cash from the pockets of the ignorant to the coffers of the motor manufacturers. And one joyfully shakes the dust of Olympia from off one's hat with the comforting reflection that, whatever befall British Industry in the future, our luxury toy trade is safe in the hands of the motor makers.

However, amongst the glittering mass of nickel-plated muckings attached to what, five years ago, might have been useful vehicles, there are some signs that one or two designers have used their brains and have realised that, when this era of promises has departed, when the Government pays in cash and the motor broker delivers in kind, and the world has again settled down to the harmless but necessary task of earning its living, the British motor-car will have to establish itself as an economically justifiable method of transport, or else depart to the limbo of the might-have-beens.

Amongst the cases wherein aeronautical practice has been applied with intelligence to the improvement and simplification of the automobile, the greatest interest attaches to the three entirely novel air-cooled light cars —the A.B.C., the Enfield-Allday, and the C.A.R., better known among aviators as the Cosmos.

In the matter of air-cooling, the experience of the last few years with regard to aero-engines may fitly and properly be applied to the design of automobile engines, since air-cooling offers at once a simpler, lighter, and cheaper engine, and in nowise necessarily entails either an unduly fragile or an unduly intricate construction.

In so far as engines are concerned, both the A.B.C. and the C.A.R. are based on the experience of their designers with aero-engines of generally similar type, and in both instances the car engine appears to be a simplified edition of the aero-engine types associated with the same name.

The A.B.C. resembles in lay-out and general appearance the 40-h.p. Gnat 2-cylinder aero-engine, with cylinders of reduced bore and stroke, fitted with detachable cast-iron heads instead of being machined from solid steel, and with two valves per cylinder instead of the Gnat's three.

In the C.A.R. engine the three cylinders are also fitted with detachable heads instead of the one piece construction. The aluminium head-plaster—which forms the valve stem guides and ports and serves to dissipate heat from the cylinder tops—the distinguishing feature of the Cosmos aero-engine is naturally preserved.

In the case of the Enfield Allday, simplicity is less in evidence. Five cylinders, together with ten valves of a novel and, one would imagine, rather expensive type, seems an unnecessarily ample allowance for an engine rated at 10 h.p., and almost certainly never called upon to deliver more than 25 b.h.p., particularly when it is considered that the cooling arrangements employed for the cylinders are those hitherto found necessary only in engines of the cylinder-in-line type developing nearly 10 h.p. per cylinder.

Nevertheless, this car does show originality in design, and in comparison with the great majority of cars it is relatively simple and free from gadgets, and its designer may be congratulated upon having produced a very effective compromise which provides the maximum of talking points with the minimum of complication.

Amongst the cars of more orthodox design which are manufactured by British firms with aero-engine experience there is a noticeable tendency to make intelligent use of that experience while refraining from talking overmuch about the fact. A notable exception is the Rolls-Royce, wherein, as far as can be gathered, no change in design has been found necessary in the power plant. This seems not unnatural, as the Rolls-Royce is now, and ever has been, equipped with an engine intended to develop a steady high power without effort, and without any of those characteristics of an intensive use of materials and the accompanying shortness of life which necessarily characterise the aero-engine.

A case where a designer with successful experience of aero-engine design has applied himself to producing a high-grade car engine in the light of that experience is the Napier. The value of aluminium as a material for cylinder block castings, owing to the excellent heat conductivity of this material and the improved cooling which can thus be effected, has been amply demonstrated in aero practice, and the extension of the habit to automobile engineering is a legitimate one. In the Napier six-cylinder engine the cylinder block and the upper half of the crankcase are cast in one piece, with detachable heads carrying the overhead valve gear bolted thereto. Not only the engine but the whole chassis has the appearance of a thoroughly sound engineering job, and the finish throughout is of the highest class.

Mr. Louis Coatalen is, of course, one of those who were most busily employed upon the design of aircraft engines during the late war, and an inspection of the power units of both the 16 and the 24 h.p. Sunbeam rather leads one to suppose that he has turned with a sigh of relief to the production of the relatively simple and satisfactory automobile engine after his wrestlings to satisfy the demands of aero-engine "experts." When the present phase has passed, doubtless most car designers will follow his example and make engines to suit car conditions rather than to ape their aerial cousins.

Wm. Beardmore & Co., Ltd., another of the firms who have designed aircraft engines which really pulled their weight, show in their car-engine design that a competent engineer can apply the experiences of one craft to the exigencies of another otherwise than by merely continuing the conventions of the first, and thus, though doubtless aero-engine experience has had its due effect, their car engine bears less outward resemblance to any known aero-engine than do the products of many makers who have not only never built such an engine, but could not if they tried.

And so with practically every firm which really has any aero-engine experience behind it. They have learnt about engines from aero-engines, and their car engines are doubtless the better for it; but they are car engines and not emasculated aero-engines.

Thus even the trade papers can only accuse one of three Wolseley models of showing "direct evidence of aero-engine influence," and that merely on the strength of its possessing overhead valves and camshafts.

Again the magnificent Armstrong-Siddeley chassis is equipped with an engine bearing much less outward resemblance to the Siddeley "Puma" aero-engine than does one not distant neighbour emanating from a firm unheard of in the world of aeronautics; but one may feel certain that the Armstrong-Siddeley engine embodies the essential of good engine practice to a considerably more useful effect.

On the whole, the show is a depressing affair, and serves still more to accentuate the idea that, far from settling down steadily to useful work, Britain is sinking still deeper into habits of luxury and sloth. The contrast between British cars and those of foreign origin does not ameliorate the impression. Class for class, the foreign cars show cleaner and simpler design, better workmanship, and a markedly smaller amount of that expensive and utterly useless eye-wash so dear to the British motor-car trader, and so prohibitive to the would-be user of his products.

W. H. S.

THE RESIGNATION OF MAJOR-GEN. J. E. B. SEELY, C.B.

The reasons given by Major-General J. E. B. Seely for his resignation of the appointment of Under Secretary of State for the Air are to be found in the reports of the proceedings in Parliament printed on page 1758.

THE SALVAGE OF AIRCRAFT.

A section dealing with the salvage of aircraft at sea is to be introduced in the Air Navigation Bill. This is a result of discussions between the Fisheries Division of the Board of Agriculture and the Air Ministry.

Aircraft on the water are to be regarded as shipping for salvage purposes. When in need of assistance aircraft are to become "wrecks" within the meaning of the Merchant Shipping Act.

It has been decided to send the first case of salvage of civil aircraft for test to the courts in order to get the law settled.

THE FEDERATION AERONAUTIQUE INTERNATIONALE.

The statutory conference of the Federation Aeronautique Internationale was held at Brussels on Oct. 22nd, 23rd, and 24th. In the absence through indisposition of H.I.H. Prince Roland Bonaparte, the President of the F.A.I., M. Jacobs, the Vice-President, who is President of the Aéro Club de Belgique, was appointed chairman. The following countries sent rerpesentatives: Belgium, Denmark, France, Great Britain, Italy, Japan, the Netherlands, Norway, Switzerland, Sweden, and the United States of America.

M. Surcouf, one of the French representatives, was appointed reporter to the conference. A Belgian should normally have been appointed to this office, but in view of the hostile occupation of Belgium during the war it was felt that Belgians were not so fully informed in aeronautics as were representatives of other countries less directly affected by the war.

It was decided by vote that requests and information for enemy countries should be supplied officially.

The draft for the revision of the Statutes of the Federation prepared by M. Surcouf under instructions issued in Paris in May, 1919, was read. There are 31 articles of the statutes and 200 articles of regulations.

Under Article 6, Paris was selected as the permanent seat of the F.A.I. No nation can be represented by more than six delegates, exclusive of secretarial staffs and delegates to special commissions.

In the discussion on Articles 14 and 15 the questions of votes and of national payments to the general fund were decided. The financial charges are to be as follows: half the budget will be paid in equal shares from each affiliated country, and the remaining half will be made up of sums proportional to the number of votes allotted to the respective subscribing nations.

After a long argument, during which both the British delegation and that from the Netherlands threatened to withdraw from the conference, it was decided that nations already in the F.A.I. should have votes proportional to their aeronautical importance, and that newly admitted nations should have one vote each. The first allocation of votes was as follows: France, Great Britain, Italy, and U.S.A., 4 votes; Belgium, 3 votes; Argentina, Brazil, Denmark, Egypt, Holland, Japan, Norway, Portugal, Russia, Spain, Sweden, and Switzerland, 2 votes, and Uruguay, 1 vote. The subvention per vote was laid down at 900 francs.

In the matter of regulations the altitude record will in future not be granted to any claimant who has not beaten the previous holder's record by 100 metres. Heights will in all cases be calculated from sea-level. The landing must in all cases be made at the point of departure.

Speed records will in future be contested for over a kilometre course by a flight in each direction at a height of 50 metres. New records must exceed preceding records by at least four kilometres per hour.

No records will in future be granted for flights with passengers. They are to be replaced by records made with useful loads.

All "feminine" records are abolished.

A new category of aeroplane—the aviette—is recognised by the F.A.I.

The decision of Great Britain in regard to the Schneider Cup was upheld, but at the request of the British delegation it was decided that Italy should organise the Cup Race for next year and hold it over Italian waters.

The Gordon Bennett Cup for spherical balloons, which has been uncontested since 1913, will be open to competition in the United States during 1920.

The United States was informed that the competitors in the New York-Toronto race have been disqualified, as the race was not held under F.A.I. regulations.

The Committee of the F.A.I. for 1920 is composed as follows: President, H.I.H. Prince Roland Bonaparte; Vice-Presidents, M. Fernand Jacobs (Belgium), M. le Comte Henri de la Vaulx (France), Colonel Monta (Italy), Major-General Holden (Great Britain), Mr. Frank Lahm (U.S.A.); Secretary General, M. Paul Tissandier (France); Treasurer, M. Georges Besançon (France).

The next conference will be held at either Geneva or Berne.

WIRELESS.

The next General Meeting of the Wireless Society of London has been arranged to take place at the Institution of Civil Engineers, Gt. George Street, Westminster, on Wednesday, Nov. 26th, at 6 p.m. After the business of the meeting, Mr. J. Scott-Taggart, M.C., A.M.I., R.E., will read a paper on "A System for the Reception of Continuous Waves," after which the meeting will be open for discussion. Mr. Scott-Taggart (who has already contributed to the columns of scientific papers and journals on themionic valves) is head of the Valve Department of Ediswan, Ltd., and members and visitors may be assured of hearing something of real interest.

The Secretary of the Wireless Society, Mr. Leslie McMichael, notifies his change of address to 32, Quex Road, W. Hampstead, and all communications with regard to the Society should be so addressed after Nov. 23rd.

A PELMANIST AMONG THE BOLSHEVIKS.

Lieut.-Colonel Cecil L'Estrange Malone, M.P., late R.A.F., whose entry into Parliament shortly after the completion of a course in Pelmanism aroused a certain degree of interest some months ago, has it appears, been on a visit to the central seat of Bolshevik disorder. He visited Moscow and Petrograd, and was honoured by an audience with M. Trotsky, one of the leading exponents of modern murder methods. He has been writing a series of articles on the things and incidents seen by him. Bolshevism and Communism clearly have attracted him. He wanted "to learn," and he is now giving the British Public the benefit of his lessons. It will be interesting to follow his public career.

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, Nov. 12th.

Major-General the Right Hon. J. E. B. Seely, M.P., was received in audience by His Majesty upon his resignation as Under-Secretary of State for Air.

BUCKINGHAM PALACE, Nov. 13th.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock this morning.

The following were severally introduced into the presence of The King, when His Majesty invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :—

THE MOST DISTINGUISHED ORDER OF SAINT MICHAEL AND ST. GEORGE.—Companion.—Lieut.-Col. Ronald Waterhouse, R.A.F.

THE DISTINGUISHED SERVICE ORDER.—Capt. Robert Steele, R.A.F.

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Officers.—Military Division.—Major James Cooper, R.A.F., Squadron Leader Vincent Richmond, R.A.F., and Major Jack Stewart, late R.A.F.

MEMBER.—Military Division.—Flight Lieut. Edward Trist, R.A.F.

The King then conferred decorations as follows :—

THE DISTINGUISHED FLYING CROSS AND THE AIR FORCE CROSS.—Squadron Leader Frederick Baker, R.A.F.

THE DISTINGUISHED FLYING CROSS.—Major Charles Mackay, R.A.F., Flight Lieut. Francis Halsted, R.A.F., Capt. Leonard Baker, R.A.F., Flying Officer William Bentley, R.A.F., Capt. Thomas French, R.A.F., Lieut. Harold Gard, R.A.F., Flying Officer Lloyd Mason, R.A.F., Lieut. Frank Noble, R.A.F., Lieut. Ernest Whyte, R.A.F., Sec. Lieut. Cyril Ambler, R.A.F., Pilot Officer Gerard Kannemeyer, R.A.F., Sec. Lieut. John Moorhouse, R.A.F., and Sec. Lieut. George Thomson, R.A.F.

THE AIR FORCE CROSS.—Wing Comdr. Dermott Allen, R.A.F., Lieut.-Col. Stanley Bell, R.A.F., Wing Comdr. Robert Ross, R.A.F., Major William Aplin, R.A.F., Capt. Gordon Alchin, R.A.F., Flight Lieut. Valentine Baker, R.A.F., Flight Lieut. Alfred Blake, R.A.F., Flight Lieut. Norman Bottomley, R.A.F., Capt John Henry, R.A.F., Capt. Cedric Jones, R.A.F., Lieut. Edward Ackery, R.A.F., Flying Officer Bertie Brice, R.A.F., Lieut. Walter Bruce, R.A.F., and Lieut. Herbert Vineberg, R.A.F.

BUCKINGHAM PALACE, Nov. 15th.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock this morning.

The following were severally introduced into the presence of His Majesty, when The King invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :—

THE MOST HONOURABLE ORDER OF THE BATH (Military Division), THE MOST DISTINGUISHED ORDER OF ST. MICHAEL AND ST. GEORGE, AND THE DISTINGUISHED SERVICE ORDER.—Companion.—Air-Commodore Henry Brooke-Popham, R.A.F. (also received the Air Force Cross).

THE MOST DISTINGUISHED ORDER OF ST. MICHAEL AND ST. GEORGE.—Companion.—Group Capt. Amyas Borton, R.A.F. (also received the Air Force Cross).

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Commander.—Military Division.—Lieut.-Col. Frederick Cleaver, R.A.F.

THE DISTINGUISHED SERVICE ORDER, THE MILITARY CROSS, AND THE DISTINGUISHED FLYING CROSS AND BAR.—Flight Lieut. Falcon Hazell, R.A.F.

THE DISTINGUISHED SERVICE ORDER AND THE MILITARY CROSS.—Wing Commander Helperus Van Ryneveld, R.A.F.

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Officers.—Military Division.—Major Allan Bridgeman, late R.A.F.; Major Charles Krabbe, R.A.F.; Major Clarence Krabbe, R.A.F., and Capt. Alexander Cassy, R.A.F. (also received the Air Force Cross).

MEMBERS.—Military Division.—Aileen, Mrs. Rathbun, W.R.A.F.; Flying Officer Kenneth Meek, R.A.F., and Pilot Officer John Adams, R.A.F..

His Majesty then conferred decorations as follows :—

THE MILITARY CROSS AND THE AIR FORCE CROSS.—Capt. Frederic Bates, R.A.F., and Capt Douglas Brooks, R.A.F.

THE MILITARY CROSS.—Flight Lieutenant Alister Bolton, R.A.F.; Flying Officer Frank Farrington, R.A.F.; Lieut. Anthony Harrison, R.A.F.; Lieut. Louis Murphy (R. Irish R.), attd. R.A.F.

THE DISTINGUISHED FLYING CROSS AND BAR.—Capt. Edgar McCloughry, R.A.F.

THE DISTINGUISHED FLYING CROSS.—Major Arthur Barker, R.A.F.; Squadron Leader Robert Leckie, R.A.F.; Capt. Norman Bolton, R.A.F.; Capt. Edward Crundall, R.A.F., Flight Lieut. Frederick Hudson, R.A.F.; Flying Officer George Blake, R.A.F. (also received the Distinguished Conduct Medal); Flying Officer Roger Blake, R.A.F.; Lieut. Ralph Bolton, R.A.F.; Lieut. William Bottrill (Canadian Infantry), attd. R.A.F ; Flying Officer Walter Brind, R.A.F.; Lieut. Cyril Leeke, R.A.F.; Flying Officer Stanley Sharpe, R.A.F.; Flying Officer Frank Woolley, R.A.F., and Pilot Officer Samuel Brabner, R.A.F.

THE AIR FORCE CROSS.—Lieut.-Comdr. Ennis Chambers, R.N.; Capt. Cyril Carleton, R.A.F.; Flight Lieutenant Leslie Clarke, R.A.F.; Flight Lieut. Wilfred Cox, R.A.F.; Capt. Norman Fraser, R.A.F.; Capt. Albert Henshaw, R.A.F.; Capt. John Stocks, R.A.F.; Flying Officer William Catchpole, R.A.F., and Flying Officer Douglas Chapman, R.A.F.

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointments have been made :—

NOV. 15TH.—Payr. Lt. (Hon. Capt., R.A.F.).—K. B. S. Greig, to rank of Payr Lt.-Comr., seny Nov. 14th.

NOV. 17th.—GUNNER.—C. J. Remfry, to "Pegasus" (Nov.15th); and (on commg.).

NAVAL INTELLIGENCE.

H.M.S. "Eagle," the aircraft-carrier, will shortly be taken from the Tyne to Portsmouth Dockyard in order to be completed for sea. Up to Sept. 30th, the latest date for which figures are available, the total expenditure incurred on the construction of "Eagle" was £2,199,358, including £1,334,358 paid to the Chilean Government in respect of work done for them before the vessel, which was originally to be the battleship "Almirante Cochrane," was taken over by the Admiralty.

It is understood that Capt. W. S. Nicholson, C.B., at present commanding "Furious," has been selected to command "Eagle." It was originally intended to launch "Eagle" last August.

H.M.S. "Furious," aircraft-carrier, will be reduced to the Reserve complement at Rosyth on Nov. 21st.

It is now announced that trials have been recently successfully carried out with a new type of torpedo-plane. The machines are said to have two 15-in torpedoes each, which is another proof that the British Navy is beginning to realise the importance of aircraft.

MILITARY.

THE AFGHANISTAN AFFAIR.

It was recently reported that when Major-General Climo presented the Peace Terms to the Mahsuds at Khirgi on Nov. 4th, three British aeroplanes were flying overhead as a reminder of the British threat of air raids if the terms were refused.

The British terms were announced to the representatives of the Northern Wazari tribes at Miranshah on Nov. 9th. Aeroplanes again taking part in the ceremony as they did at Khirgi. These machines had previously dropped leaflets, over the surrounding country, advising the tribesmen to remove their women and children, as the bombing operations would begin almost immediately should the terms be refused. Even so, the Wazaris were given until Nov. 17th to decide.

AIR FORCE.

BOY MECHANICS FOR THE ROYAL AIR FORCE.

The Air Ministry has recently instituted a new scheme to secure the entry of well-educated boys for a systematic Course of Training as skilled craftsmen for service with the Royal Air Force.

Under this scheme, boys will be entered between the ages of 15 and 16 years for a period of 10 years' colour service followed by two years' service in the Reserve. During the first three years they will undergo a course of Educational and Workshop training, at the end of which those who have passed the requisite tests will be promoted forthwith to the rank of Leading Aircraftsmen in one or other of the skilled trades.

To give scope to the more capable and ambitious boys, and to ensure that the Air Force shall secure the full benefit of their ability, a certain number of those who show most promise during their training will be chosen for an additional six months' course of higher instruction, being promoted at once to the rank of Corporal. From among these, some may be selected for the grant of a commission, and will proceed to the Cadet College for training as Flying Officers with the Cadets entered by open competition.

There will also be opportunities for promotion to a Commission at a later stage to those who show their suitability during their service in the ranks.

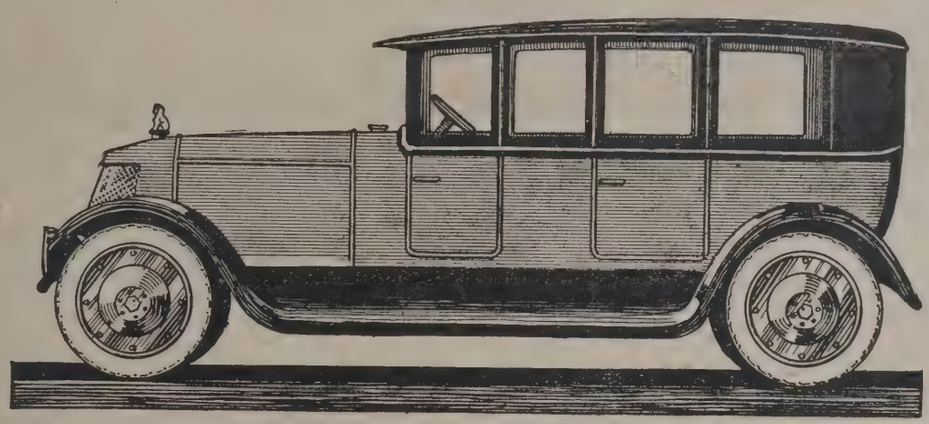
In order that the opportunity of competing for entry into the Royal Air Force under these conditions may be brought within reach of the largest possible number of boys, two distinct methods of admission are being arranged: (1) Open competitive examinations, (2) Examinations limited to candidates nominated as in every way suitable by the local Education Authority of their district. A limited number of candidates with Service claims may also be admitted on the nomination of the Air Council subject to their passing a quali-flying test only.

The first examination under the scheme will be one for boys nominated by their Local Education Authority, and will take place in December. Full particulars in regard to the arrangements of the grant of nominations for this examination have been circulated to the Local Education Authorities throughout the country, many of whom have already promised their support. As nominations must reach the Air Ministry not later than November 22nd, prospective candidates should communicate with their Local Education Authority without delay. Boys who are successful in this examination will enter the Training Centre early in February, 1920.

During the war it was not possible to give enlisted boys more than a few months' training, neither was it feasible to confine the entry only to boys of sufficient intellectual attainments to ensure that they would benefit by a long apprenticeship in R.A.F. technical trades.

The scheme which forms the subject of this communiqué constitutes an entire departure from the methods imposed by war conditions, and is designed to meet the requirements of the R.A.F. as organised on a permanent basis

Training Centres are consequently being reorganised to deal with this new entry, and the machinery of education, both general and vocational, is being largely increased and developed for the same purpose.



AN INVESTITURE.

A correspondent writes ;—

Mr. W. G. Yeulett, of Walton, was presented at Uxbridge on Nov. 12th, by Sir John Maitland Salmond, K.C.B., with the Distinguished Flying Cross, won by his son, the late

The ARMSTRONG SIDDELEY Six Cylinder Car

R.A.C. Rating 29·5 H.P. Treasury Tax £88 0

THE new Armstrong Siddeley 6-cylinder car is of entirely original design and embodies the experience gained during the past four years in the production of aircraft engines aggregating over 2,000,000 (two million) horse-power.

¶ You cannot buy a better car.

¶ It is a motor carriage of high efficiency, stately appearance, ample power, and constructed of the best materials. It is light. It is comfortable. It is dependable. It runs smoothly, silently and is easily managed.

¶ Maintenance costs are small. Three years' free inspection.
¶ The low price at which it is sold is made possible by its simple design and by quantity production.

PRICE of CHASSIS £720

EQUIPPED WITH Disc Wheels and one Spare Rim; four 820 by 135 Rubber Studded Tyres; Specially designed Wings; Scuttle Dash with Instrument board; Lucas Engine Starter and Electric Lighting, complete with 5 Lamps, Mechanical Tyre Pump, Kit of Tools, Etc.

Saloon Double Phæton (as illustrated)...£1,000

Godbolds

Lieut. W. A. Yeulett, R.A.F., for "conspicuous gallantry in a long-distance bombing raid upon enemy aircraft stations under very difficult circumstances in July, 1918." Lieut. Yeulett was killed during this raid.—J. F. S

THE RELINQUISHMENT OF AERODROMES.

It is stated in the local Press that both the Airship Station at Polegate and the Coal Aston Aerodrome are being closed down. The personnel and material in both cases are being transferred to other stations.

ANDOVER AERODROME.

The Andover Guardians, who complained to the Air Ministry concerning the waste of timber at the Andover Aerodrome, have received a reply to the effect that the dump consisted of surplus hangars from all the aerodromes of the district, which had been brought to Andover for disposal. Some had been removed, others would be shifted for service elsewhere, and the remainder, from 18 to 20, would be disposed of by the Disposal Board.

The Andover Guardians were not satisfied with the reply and have decided to approach Sir Auckland Geddes on the matter.

ALEXANDRA PARK, MANCHESTER.

The decision of the Air Ministry to relinquish the Alexandra Park Aerodrome, Manchester, in the near future on the ground of economy has led to the Lord Mayor and local members of Parliament making strong representations with a view to its retention, as it is considered to be of great importance to the future of Manchester as an industrial centre.

THE HOWDEN AIRSHIP STATION.

The "Yorkshire Herald" of Nov. 3rd makes the following revelations with regard to accidents at Howden during the war :—

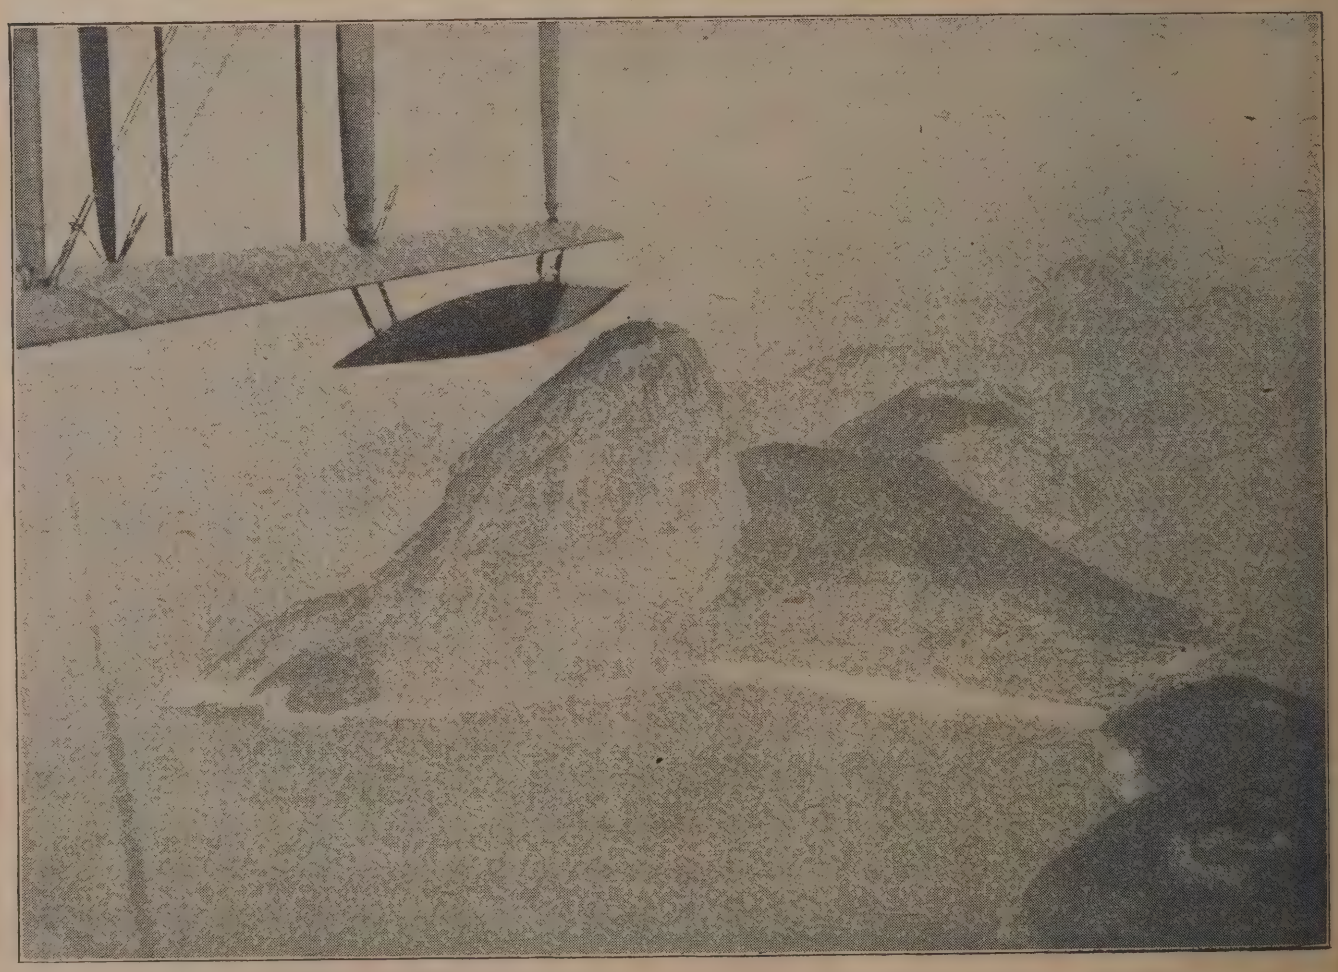
"The first accident happened in 1917, when a small airship came to grief near Foggathorpe Hall Farm. The crew fortunately jumped from the ship and were saved. The ship was a total wreck. Later in the year another ship of a similar type fell into the Humber, three of the crew being killed and the craft destroyed. In 1918 an accident occurred at the station. It was caused through a fire breaking out in R.27, which spread to three other 'blimps' all housed in one shed. A bomb in R.27 exploded, wrecking the ship and making a large hole in the roof of the shed. All the aircraft involved were destroyed, and one young man, who was on the look-out on the shed top, was suffocated. There at present lies near to the sheds a large heap of firewood and wire which was originally R.31, which broke its back after being prepared for a trip to Scotland."

This paper also states that since the decision to make Howden permanent, the aerodrome has been extended by commandeering land on the Spaldington side.

FENCING IN THE R.A.F.

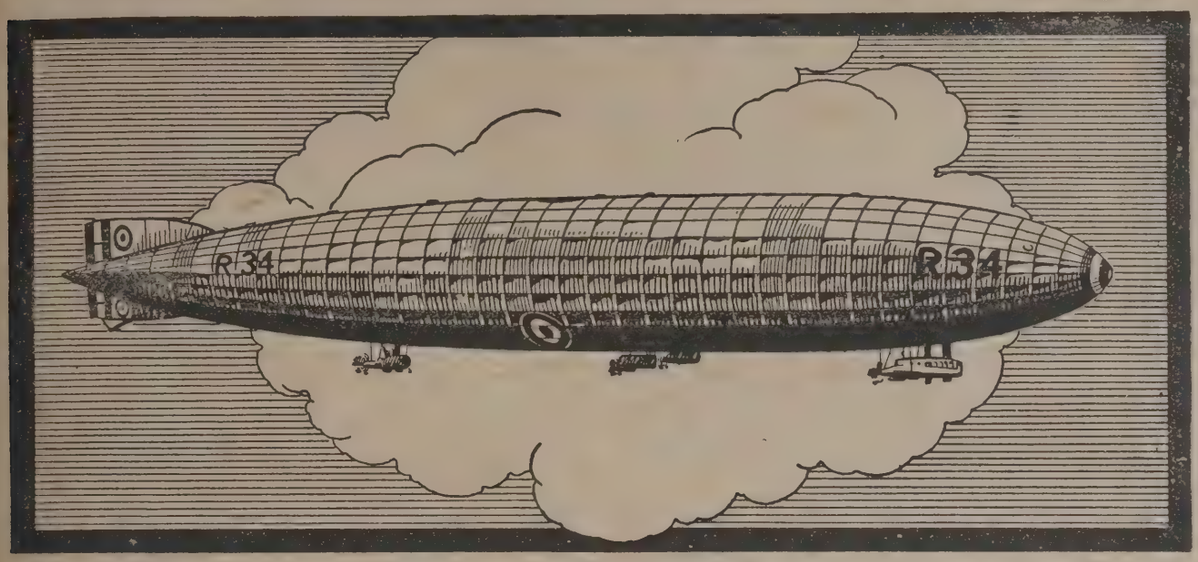
The Royal Air Force have concluded a series of fencing competitions at Uxbridge.

The competitions, which were open to all ranks of the R.A.F., comprised Foil v. Foil, Sabre v. Sabre, Epée v. Epée, and Bayonet v. Bayonet, and as a result the following officers and warrant officer who were first, second or third in all events, qualified to represent the R.A.F. against the Army fencing team in London on Wednesday, Nov. 19th :—Squadron Leader E. G. H. Clarke, M.C., Flight Lieut. F. G. Sherriff, M.C., and Sergt.-Major H. Grainger.



R.A.F. TITLES.

The following letter has been received :—



Sir,—There is one point about the new titles for the Royal Air Force which does not so far appear to have been considered, and that is—how are they to be used socially and in ordinary conversation?

No doubt in the higher ranks, Wing Commander, Group Captain, Air Commodore, etc. (by the way, what a pity all the titles are double-barrelled), the prefixes will be generally omitted and officers will be called simply "Commander," "Captain," etc. This will cause confusion with the Naval ranks of similar name, and to this extent the Air Ministry's desire to obtain distinctive titles will be defeated. I suppose, however, this factor was taken into consideration when the new titles were decided on.

The title "Squadron Leader" is entirely new and presents some difficulties when considered from a social or conversational point of view. Suppose we wish to invite Squadron Leader Jones to dinner, should we write "Dear Squadron Leader Jones"? Even if we do, we cannot imagine Jones' partner at dinner addressing him all the time as, "Oh, Squad-

The Sugar Loaf Mountain in the entrance of the Bay of Rio de Janeiro, photographed from 1,500 by a Brazilian Naval Aviator.

"Cordial Appreciation" of the Skill and Energy———

"Sincere Congratulations to All Concerned"————

In these words do the Lords of the Admiralty express their opinion of the firm which produced the engines which enabled R.34 to make her journey across the Atlantic and back.

SUNBEAM-COATALEN AIRCRAFT ENGINES

are Second to none.

THE SUNBEAM MOTOR CAR CO., Ltd.,
MOORFIELD WORKS, WOLVERHAMPTON.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

ron Leader Jones, do tell me what it feels like to fly," etc., etc. Yet dropping the prefix in this case does not help at all, for "Leader" by itself sounds even worse.

Flight Lieutenant can and will, of course, be shortened to Lieutenant; but the new titles of "Flying Officer" and "Observer Officer, and "Pilot Officer," present the same difficulty as Squadron Leader

Officers of the last two ranks will presumably be know as "Mr."; but I would like to suggest that the use of the title "Mr." be carried further, and that the same convention be adopted throughout the R A.F. as is used in the Navy, where all Officers of the rank of Lieut.-Commander (corresponding to Squadron Leader) and below are addressed as "Mr."

(It is true that one sometimes hears Lieutenant-Commanders addressed or referred to as "Commander," or even "Captain"; but this is only done by people outside Naval circles, who are ignorant of the proper convention.)

The question for the Air Force is hardly one about which we can expect the powers that be to issue regulations or lay down hard and fast rules. But considering that for every time one's title is used officially (e.g., in official correspondence, etc., when, of course, the full title would be given), it is used probably a hundred times in ordinary conversation, it does seem to me to be one which should be settled as soon as possible so that the necessary convention may grow up.

I suggest, therefore, that every officer and every mess in the R.A.F. should agree that in ordinary conversation all officers up to and including the rank of Squadron Leader be referred to as "Mr." If this custom were brought into practice at once it would very soon be fixed in general use.

To some people this may seem a trivial matter; but personally I think that in a new Service like ours small points like this are of some importance.

(Signed) SQUADRON LEADER, R.A.F.

FRANCE.

THE FRENCH MISSION IN CHILI.

On Nov. 6th M. Gilbert, Minister of France in Chili, gave a banquet for Capt. Guichard, member of the French Aviation Mission. The G.O.C. the Chilean Aviation Service and his staff were present at the dinner.

SPAIN.

An aeroplane crashed in the evening of Nov. 16th, or, as another says, early in the morning of Nov. 17th, at Casas de Villaseca, in the commune of Benamira, in the province of Soria. The crew, Capt. Laños, the French aviator Augostini, and three mechanics, were killed.

It is thought that the machine is a twin-engine Farman, built to carry seven passengers, and that it was piloted by the French aviator, Augostini, who was due to arrive on Nov. 16th at Cuatrovientos, Madrid, from Pau, at the same time as another machine piloted by the aviator Sains, who landed later.

ITALY.

POST-WAR RELATIONS.

The Italian correspondent of THE AEROPLANE writes :—

In reply to a venomous attack on war expenses in a Turin paper commonly reputed to be the organ of the anti-Italian part, the Hon. Chiesa, ex-Under Secretary for Aviation, who held office during the most difficult period of the war with courage and conviction, writes of the conditions of those times and gives unpublished particulars of great interest.

Promised by the Naval authorities—who were themselves clamouring for "600" Capronis to the number of 1,200—some 10,000 tons of transport space per month for the carriage of raw materials from America, the Ministry obtained 600 tons space owing to the lack of shipping which was caused by war losses. At that time about 386 millions of lire had been assigned and orders given to the aero trade.

Without consulting the constructing firm in Italy the Hon. Chiesa's predecessor had given free and gratis the right to build 1,000 Capronis to the U.S. Government. Consequently the Ministry found itself up against various evident injustices and were inclined to be generous. (Hence, no doubt, all the envious feeling at the bottom of the long and lamentable display of jealousy.)

The Hon. Chiesa gives the following figures showing the height of production reached in 1918 by the Italian trade :—

Monthly output : Motors, 1,700; machines, 750. The material existing in December, 1918, and in active service conditions was :—Motors, 9,743; machines, 5,950. One thousand six hundred and fifty engines and 2,400 machines were then in the refitting shops.—T. S. H.

ONE RESULT OF AIR RAIDS.

The Briglia del Carmine, the big electric power plant and building of the water supply station at Padua, which cost nearly 3,000,000 lire (about £120,000), with all its machinery, collapsed on Oct. 29th and fell into the canal of Bacchiglione. It is thought that the cause of this was the bombing of Padua in February of last year when three big bombs fell near this building. The building was erected in 1882.

U.S.A.

The following is extracted from the Official "Air Service News Letter" of the U.S. Army, dated Oct. 25th, 1919. When one compares the frugal extravagance of our own Air Ministry with the lavish expenditure on aeronautics in the U.S. Army one's opinion of British foresight fades.

"AIR SERVICE LEGISLATION.

A Bill was introduced in the House of Representatives on Oct. 22nd, 1919, and referred to the committee on Military Affairs to the effect that the Secretary of War be authorised and directed to acquire for the United States, by purchase or condemnation, for use as an Aeronautical Experimental development and engineering plant, the following pieces of real estate :—

"The Dayton-Wright airplane factory and plant situated on Edison Street, Dayton, Ohio, consisting of about thirty-three (33) acres of land at a cost not to exceed three hundred and ninety thousand and ninety dol. and eighty cents ($390,090.80); the land adjoining the Dayton Plant, known as the Moraine Tract, consisting of about eight hundred and thirty-six (836) at a cost not to exceed one million sixty-six thousand six hundred and thirty-six dollars and ninety-four cents ($1,066,636.94); also the tract adjoining and north-west of the Moraine Tract comprising about seven hundred and sixteen (716) acres at a cost not to exceed five hundred and nineteen thousand six hundred and forty-eight dollars and fifty cents ($519,648.50).

"That the unexpended balance of appropriations made heretofore for aeronautical purposes by the Act authorising the President to increase temporarily the Signal Corps of the Army, shall be made available for the purposes set forth; that the sum of one million one hundred and twenty-nine thousand five hundred dollars ($1,129,500) be appropriated from any money in the Treasury not otherwise appropriated for construction work on structures and utility or alteration or expansion thereof, or the installation of such equipment necessary for the establishment of an experimental engineering plant on the above described land. Two hangars, one at a cost not to exceed two hundred thousand dollars ($200,000) and the other not to exceed three hundred and seventy-five thousand dollars ($375,000)."

THE FOREST PATROLS.

The commanding officers of March, Mather, and Rockwell Fields and the Ross Field Balloon School were instructed to arrange for forest patrols for the location of fires. The routes were laid out after consultation with the District Forester and the patrols began on June 1st last. It was thus possible to give information as to forest fires within fifteen minutes of their outbreak. Each aeroplane so employed is fitted with a wireless outfit and reports at intervals throughout its patrol. Its position at any given moment is known to the officer commanding the landing ground from which it started.

The following extract from a letter written by the Forestry Service is of interest :—

"The value of timber given protection by forest patrols in the Tahoe National Forest is estimated at $18,000,000 and the value of farm property and crops is estimated at the same figure, to that date 30 fires being reported, 12 being inside forest. In the Stanislaus National Forest the value of timber protected is estimated at $19,280,000 and in the Eldorado National Forest at $25,000,000. Aircraft having proven of such value in reporting fires, the Department Air Service Officer was given authority to establish additional patrols during the time when fires were most serious in the forest areas of California. During the week of the Oregon patrols (which were organised later) 16 patrols were made and 28 fires located. A patrol of the whole State began on August 9th, with bases at Roseburg and Salem, and a consolidation of the daily report shows the following data for the month of August. A total of 82 patrols were made, 190 fires reported and 13,835 miles flown. During the latter part of August, Salem and Roseburg were abandoned and a new base established at Redding, California, also one at Fresno, California. On Sept. 17th the base at Redding was changed to Redbluff, California, and this patrol has since reported as many as ten fires in a day."

The forest patrols have worked with great success. Intentional fires are being prevented. Many patrols cover 300,000 acres twice in one day. Under normal conditions, before aeroplanes were used, 24 hours at least elapsed before detailed information as to fires was received, whereas on a recent occasion the District Forester was able to plot two great fires on one map in the course of a 90-minute flight. During Sept. 249 patrols were carried out, 67,511 miles covered and 160 fires reported.

Chairman and Founder (1911): G. HOLT THOMAS

The Largest Aircraft Enterprise in the World

THE Aircraft Manufacturing Company, which with its associated Companies, is the largest aircraft enterprise in the world, is in a unique position to undertake the construction and complete equipment of aircraft for every kind of commercial, scientific and administrative purpose.

While many firms are dependent upon outside industries for essential parts of their output, the vast Airco resources and experience enable the associated companies to carry out practically every phase of modern aircraft construction in their own works and under their own skilled supervision. The importance of this fact will be appreciated by those responsible for the inauguration and development of public air services.

Among the highly specialised products of the associated Companies are:

HIGH-SPEED AEROPLANES, AIRSHIPS AND KITE BALLOONS, SEAPLANES AND FLYING BOATS, AERO-ENGINES, PROPELLERS, INSTRUMENTS OF PRECISION, etc., etc.

THE AIRCRAFT MANUFACTURING CO., LIMITED.

AIRSHIPS LIMITED. GNOME & LE RHONE ENGINE CO, (Peter Hooker, Ltd.),
MAY, HARDEN & MAY, Seaplane Base, HYTHE. INTEGRAL PROPELLER COMPANY, LTD.

London Offices: 25-27, OLD QUEEN STREET, LONDON, S.W.1.

THE FLIGHT TO AUSTRALIA COMPETITION.

The Sopwith Machine.

A Reuter message from Mayence, dated Nov. 16th, stated that Captain Matthews has been detained at Gouzenheim, five miles from Mayence, for the last ten days owing to bad weather.

The Vickers Machine.

Capt. Ross M. Smith, M.C., D.F.C., A.F.C., accompanied by Lieut. K. M. Smith, Serjeant Bennett, and Serjeant Shiers, left Hounslow on the Vickers-Vimy machine on Nov. 12th, at 9.10 a.m. The Royal Aero Club were represented by Major R. H. Mayo, and Lt.-Comm. H. E. Perrin, and Vickers Ltd. by General Caddell. A correspondent writes :—

The machine was constructed and tested at the Weybridge works of Vickers Ltd. It was put through its final test flights by Capt. Sir John Alcock at Brooklands, which is a happy omen for the success of the flight, considering that the "Vimy" Transatlantic machine was also constructed and tested by Sir John Alcock at Brooklands.

The Australian "Vimy" is practically identical with the Transatlantic "Vimy," except that it has a front skid in place of the fifth wheel on the other machine, and has a smaller petrol capacity.—J. F. S.

On Nov. 13th news was received that the machine had reached Lyons after a flight of about six and a half hours, and on that day they landed at Pisa.

It was reported on Nov. 18th that the machine had arrived at Rome after experiencing very bad weather.

The Blackburn Entry.

The Blackburn "Kangaroo" (two Rolls-Royce "Falcon" engines) was to have left Hounslow on Nov. 17th, but the start had to be postponed owing to the weather. The machine was to fly from Brough in Yorkshire to Hounslow on Nov. 18th, if the conditions were favourable, and start for Australia on the next day.

The Alliance Fatality.

The third British machine to leave for Australia was the Alliance, with a 450-h.p. Napier engine. Piloted by Lieut. Roger Douglas, M.C., D.C.M., Aus.F.C., and with Lieut. J. S. L. Ross, Aus.F.C., as navigator, the machine left Hounslow on Nov. 13th at 11.35 a.m.

A note was published on the aviators and their machine in the issue of The Aeroplane for Nov. 5th.

The Alliance passed over South Teddington very low down and attracted much attention owing to the noise that it made. At Kingston the machine appeared to be in difficulties, and at Surbiton it suddenly nosedived to the ground and broke down a large tree. The machine was totally smashed. The airscrew was found buried in a field near by.

The body of Lieut. Ross was found lying some seven yards from the aeroplane. Immediately on the arrival of the police an effort was made to remove the wreckage, which had buried Lieut. Douglas, and eventually he was extricated in a dying condition and passed away in the presence of Dr. Pattison Armstrong.

The inquest was held on Nov. 17th. Lieut.-Col. Ridley represented H.Q. the Australian Imperial Forces, Mr. L. C. Tree watched the proceedings for the Alliance Aeroplane Company, and Viscount Erleigh, for Napier and Sons, Ltd.

The following account of the proceedings is taken from the "Morning Post" :—

Donald Easdale, chief draughtsman to the Alliance Aeroplane Company, identified the bodies as those of Lieut. Roger Douglas, aged 25, and of Lieut. James Stewart Ross, aged 24, both of the Australian Flying Corps. The two officers had been flying the machine which met with disaster for about three weeks and for several hours each day. The two officers understood its construction in every detail, having seen it built in the workshops. They were due to start on their flight on Thursday morning, but a late start was made owing to early snow and mist. As the weather became clear they set out at 11.33 a.m.

Machine in Perfect Condition.

James Arthur Peters, aeroplane designer, of Woodville Gardens, Ealing, said he designed the aeroplane. He and the chief test pilot flew a similar machine at Madrid in July last year, and they were also the first to fly the aeroplane which met with disaster.

The two officers were trained, and in the event of mishap to the machine they should have been able to deal with it. [It will appear that Mr. Peters did not say that these officers were trained in this particular machine, or that they had ever flown in it.—Ed. The Aeroplane.]

The machine was in perfect condition, and was ready to start any time after dawn. It was "run up" to the satisfaction of Messrs. Napier's representative, and all the usual precautions were taken. Weather reports were received from France prior to the start. The total weight of the machine was 5,900 lb.

An independent examination had been made of the machine on behalf of the Air Ministry, and every control cable and lever was found to be connected and compact [(intact?)—Ed. The Aeroplane.] The engine had since been stripped and found to be in perfect mechanical order.

The log (produced) was kept by Lieut. Ross, and stated : "Left Hounslow, 1,200 feet. Engine, 1,650 revolutions per minute," and gave his course, which was approximately to where the machine was found.

It had been arranged (witness continued) that if a difficult landing had to be made with any considerable load of petrol the petrol release should be used. After the disaster that valve was found closed.

Three eye-witnesses called were P.C. Money, Arthur C. Knite, mechanical engineer, Abbey Road, St. John's Wood, and Mrs. Evelyn Jones, of Surbiton, who, respectively, estimated the height at which the aeroplane was flying just prior to the disaster at 500 ft., 700 ft., and 1,000 ft.

Cloud Dangers.

Mr. Knite and Mrs. Jones, who said she had lived in the vicinity of aerodromes for three years while her husband was a captain in the R.F.C., agreed that just before the disaster the engine of the aeroplane shut off. The machine came out of the clouds and then spun round as it nose-dived to earth. It appeared that the pilot did his best to right the machine, but failed.

Mr. Peters, recalled, said it was a common thing to come out of a cloud in a spin, and the obvious thing to do in that case was to shut the engine off and push the nose down. He was of opinion that the machine came out of the cloud too low. There was not sufficient room for the machine, whether at a height of 500 ft. or 1,000 ft., to right itself.

Lieut. Douglas, an exceptionally experienced pilot, undoubtedly did his level best to right the machine. If he (witness) had been in a similar position he could not have done more.

By Viscount Erleigh : Once in a cloud one lost sense of direction apart from instruments. It was difficult to tell then whether a plane was flying upright. The machine was designed for high flying.

The hearing of the case was subjected to several interruptions from persons at the back of the court. A gentleman, who said he was a licensed aeroplane engineer, asked permission to give evidence, but the Coroner, on learning that he had not the authority of the Air Ministry to tender such evidence, would not admit it.

Mr. Frederick Richard Draper, head of the testing department of Messrs. Napier, said the deceased officers told him that the aeroplane in question was the best machine they had ever flown, and that they did not wish for a better engine. Witness was present at the examination of the remains of the aeroplane by the Air Ministry that morning, and everything was found to be mechanically correct.

Question of Sufficient Test.

Miss Mabel Desmond Woolley, who was dressed in black, stated she was the fiancée of Lieut. Douglas, and asked permission to put to the experts the question whether they thought a five minutes' flight from Acton to Hounslow was a sufficient test for an aeroplane before a flight of several thousand miles to Australia was attempted.

The Coroner called Miss Woolley's attention to the evidence already given by Mr. Peters.

Miss Woolley : I know what I am saying. I saw Lieut. Douglas every night. My boy did not fly that machine until he left Acton Aerodrome for Hounslow previous to the flight. It was not ready before.

The Coroner : You have heard the evidence of the witnesses who are on their oath? In further reply to Miss Woolley, the Coroner said he was only inquiring into the cause of death.

Miss Woolley : Then you miss the things that matter.

The Coroner : That means I am incompetent or not doing my duty?

Miss Woolley : I think you are not doing your duty.

The Coroner : Very well; you can apply to the Lord Chancellor and say so.

The Coroner read a report which Lieut. Douglas had submitted to the Alliance Aeroplane Company on Aug. 21st stating that since he had joined the Royal Flying Corps he had flown practically every type of machine, and that he was firmly convinced that the particular machine on which he was going to make his flight was far superior in every respect to any type he had ever lifted off the ground.

WESTLAND

The Westland "LIMOUSINE"

with the "Rolls-Royce" engine. This is not a converted war machine, but has been designed and built for high-class public passenger service or for the convenience of the private owner.

During the strike a Westland "Limousine" was taken over by the Air Ministry for carrying H.M. Mails. In that week the machine flew nearly 1,000 miles without the slightest defect appearing. A great part of this distance was covered in very bad weather, testing the air worthy qualities of the machine to the utmost.

It combines the speed of an aeroplane with the comfort of a Limousine.

For full particulars and arrangements as to trial flights apply to our London Representative, **Lieut.-Colonel C. H. MEARES,** c/o MESSRS. PETTERS, LIMITED, 6, DEAN'S YARD, WESTMINSTER, LONDON, S.W.1.

ANOTHER INTERRUPTION.

A man who said he was a friend of Lieut. Ross, and who had been repeatedly interposing questions, protested that he was not allowed to put them to the witnesses. "Not enough," he added, "has been said as to what happened on Oct. 30th and Nov. 13th.

Miss Woolley: That is what I say.

The Coroner (to the man): Do you know?

The Interrupter: I do, sir, but you will not hear me.

The Coroner: I will not hear you now, and I will get the police to remove you if you trouble me any more.

The Interrupter: It is a packed room.

In summing up, the Coroner said they were not there to make all sorts of inquiries, but to ascertain the cause of death. The jury might take it that the authorities both at home and in Australia would hold a different inquiry, at which all the questions such as had been raised that day could be thrashed out.

A verdict of accidental death was returned, no blame being attached to anyone.

[It is to be hoped that the evidence to be given at the official inquiry will be published, as it seems that there is other matter affecting the accident which was not brought out at the inquest. The accident, occurring as it did to a machine which occupied public attention, has no doubt shaken the faith of some members of the public in the safety of Civil Aerial Transport, and it is very desirable, in the interests of the British Aircraft Industry in general and of the Alliance Company in particular, to remove any impression that evidence is being withheld.—Ed., THE AEROPLANE].

LORD FISHER AGAIN SPEAKS.

The following letter appeared in the "Times" of Nov. 6th:

Sir,—By land and sea the approaching prodigious aircraft development knocks out the present Fleet, makes invasion practicable, cancels our country being an island, and transforms the atmosphere into the battle-ground of the future.

I say to the Prime Minister there is only one thing to do to the ostriches who are spending these vast millions ("which no man can number") on what is as useful for the next war as bows and arrows!—"Sack the lot."

Yours, FISHER.

Postscript.—As the locusts swarmed over Egypt, so will the aircraft swarm in the heavens, carrying (some of them) inconceivable cargoes of men and bombs, some fast, some slow. Some will act like battle-cruisers, others as destroyers. All cheap and (this is the gist of it) requiring only a few men as the crew.

No one's imagination can as yet depict it all. If I essayed it now I should be called a lunatic. I gently forecast it in January, 1915, and more vividly on July 11th, 1918. We have the star guiding us, if only we will follow it.

"Time and the Ocean and some fostering star
In high cabal—have made us what we are!"

On Friday last the presiding genius at the "Marine Engineers" said: "The day of oil fuel and the oil engine had arrived." In 1885 I was called an "oil maniac."—*Nunc Dimittis.*

The following appeared under the heading "Marr'd" in the "Times" of Nov. 10th:—

Sir,—Do you hear the bleating of these sheep in your ears? We are going to hew Agag into pieces! (I refer to the moaning of the Admirals and to the keeping the best of the ships—exactly the same spirit as Saul.) There was the same bleating of the sheep and the same preservation of Agag when masts and sails were doomed and the engineer came into his own! Saul got kicked out for not "sacking the lot."

The reason I put the word "marr'd" at the head of this letter is that when, six months before the war, a Cabinet Minister of that period read my printed memorandum that German submarines would sink defenceless merchant ships with their women and children, he observed that I had "marr'd" my memorandum by that prophecy! Don't let us have another "marr'd" prophecy.

The air controls the water. Unless all warships can get under the water they will be blown out of the water. Millions upon millions of money are still being wantonly wasted in the upkeep of ships that can't be used in war. When this winter the price of food and coal goes up, the masses will "sack the lot." A gust of fury will clear out this effete Parliament.

Yours, FISHER.

AN OPPORTUNITY FOR BRITISH MANUFACTURERS.

It is stated upon excellent authority that the Monaco meeting to be held at the end of April next will include a competition for seaplanes.

The exact details have not yet been officially settled, but the general principles upon which the competition will be based are as follows:—

On the first day competitors will be required to fly from Monaco to Tunis, with an intermediate landing at Corsica. On the second day they will fly from Tunis to Kabes and back. On these two days marks will be allotted on a basis of useful load carried and on petrol consumption. On the third day a non-stop flight from Tunis to Monaco will complete the tests, and this flight will be marked on the speed attained alone.

All landings are to be made in the open sea, and all competitors will, it is understood, have to carry a specified minimum useful load over and above crew and fuel, of something of the order of 200 kilogrammes.

"THE AEROPLANE IN THE GREAT WAR."

THE AEROPLANE IN THE GREAT WAR. By W. L. Wade. Pp. vi+229. Ilus. London: Virtue and Co., Price 16s.

The late Mr W. L. Wade was for some years before his death the assistant editor of THE AEROPLANE. Incapacitated by physical disability from entering His Majesty's service during the war, he served his employers with a devotion and single-mindedness none too common in modern life. His knowledge of aeronautics was extensive, and his vivid memory enabled him to write with accuracy and interest on the history of the progress of flying in all its branches.

Shortly before his death he completed the writing of the book now under review. All that remained was to correct the proofs and to supervise the general arrangement of the work. Both of these have since been done by Mr. C. G. Grey, the editor of this print, as a token of his high opinion of Mr. Wade's character and ability.

There are only two ways in which to write a book on military aviation in the past war. The first of these is to deal exhaustively with each branch of the subject and to relate with meticulous accuracy the aerial events of each day during the war. A work of this nature would hardly be encompassed in half-a-dozen volumes, and its preparation would take years of arduous endeavour. The examination and collation of the necessary official documents would provide employment for several people for months to come. The alternative is to write a popular disquisition which would relate briefly the progress of the employment of aircraft in war, give typical stories of the varied incidents which occur in aerial history, and convey a general impression of the life and duties of the military aviator.

Mr. Wade's book is arranged on the latter plan, and he has succeeded in giving an excellent general survey of wartime aviation. He has devoted little space to the intricacies of detail and has instead illustrated each of his points by anecdotes of actual incidents. Each theatre of war is dealt with in turn, and there are chapters on bomb raids, reconnaissance, queer landings, captures, and the "star turns" of the Flying Services. Signor Gabriele d'Annunzio, once renowned for the charming decadence of his plays and now known chiefly as a practical apostle of "self-determination" in world-politics, has a chapter largely devoted to his exploits as an observer on bombing machines.

The book is free from irritating inaccuracies in the names and ranks of pilots, and naturally there are no mistakes in the descriptions of the aeroplanes or of the work done by them.

An excellent summary of each year of war in so far as aviation is concerned is inserted at the end of the volume.

There are many illustrations, some of them coloured, and all save a few photographs are drawn by Mr. Geoffrey Watson. The book is well designed as a suitable present for the youth whose growing interests are centring temporarily on aviation.

THE SONGS OF THE R.A.F.

The following letter has been received from Mr. S. G. E. Inman Knox, Lieut., R.F.C., 69, Sumner Place Mews, S. Kensington:—

Sir,—A few of my friends and myself, ex-R.F.C. officers, are endeavouring to compile a complete collection of the songs of the Flying Services, with a view to publishing them.

We would be very much obliged if any of your readers would be so good as to send any flying songs, or parodies they know of, to the above address. We would also like to point out that songs that were well known in some squadrons were practically unheard of in others, so all will be welcome.

We should be very grateful if you could find room for this letter in your columns, as we feel that such a collection of the many songs that did so much to brighten the "dud-weather" periods in our overseas squadrons will find a welcome, not only in the R.A.F. messes still "carrying on," but in the homes of ex-flying men when now and then old members of the Services foregather.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In this issue there begins a very interesting and highly eulogistic report upon the design, construction, and performance of the Rolls-Royce aero-engines.

This article is abstracted from the German journal "Der Motorwagen," and is based on examination of various samples captured by the German forces during the War.

It is probably the most disinterested and the most gratifying testimonial to the enterprise of the British Aircraft Industry which has yet been penned.

A further instalment of the article on the work of the Experimental Depot at the Isle of Grain gives details of a high-speed seaplane scout and of a two-seater reconnaissance ship-plane designed and built at that station.

Details of a number of accessories of interest to the Aircraft Industry which are to be found at the Motor Show, Olympia, are given on page 1748.

A GERMAN APPRECIATION OF THE ROLLS-ROYCE AERO ENGINE.

TRANSLATED BY ERIK HILDESHEIM, COPENHAGEN.

The report by Herr Otto Schwager, B.Sc., on the Rolls-Royce aero-engine, which was announced by the German technical journal "Der Motorwagen" last year as amongst the value to be given for the increased subscription rates, has now been published.

The following is an abstract of that account :—

One of the most interesting of hostile aero-engines, on the highest plane in respect to design, is undoubtedly the Rolls-Royce.

Each detail of design has been dealt with most carefully and with highest affection. With respect to commercial manufacture one is inclined to say that the designer has done too much of good. At any rate, the aim could in many instances have been attained with much simpler means.

Yet, on the other hand, the Rolls-Royce motor is a classic example of how the designer can avoid every possible difficulty which can be foreseen in the design and thus ensure success; for many details of design are undoubtedly not the results of long lasting experiments, but the achievement of a thinking designer.

The motor is built in two different models, as a 12-cyl. V-type engine, either with 101.6 mm. bore and 146 mm. stroke, or with 114 by 165 mm. bore and stroke. The nominal output of the small motor was originally 190 h.p. and of the large one that of 250 h.p., which have been gradually increased to 275, 320, and 352 h.p., partly as the result of an increase of the number of revolutions from 1,600 and 1,650 to 1,800 r.p.m., and partly by increasing the compression ratio from 4.84 to 5.51 and to 5.43, and by increasing the gas intake sections.

In the accompanying table of figures the various figures of the design—partly given on the maker's nameplate and partly derived from measurements and trials carried out—have been grouped. The two more powerful engines in this table are distinguished by the type word "Eagle," and the new editions of the small engine are provided with a similar trade word, "Falcon."

The large type will be described by means of illustrations and drawings, and the differences, marking the various horse-powers, will be reported upon in detail.

The general arrangement of the engine is evident from the illustrations. The case will be seen to be of a 12-cyl. V-type motor with a gear drive to an airscrew hub on the same line as the crankshaft.

The whole motor is mounted on a crankcase which, with the exception of the gear-box bolted to the front side, is composed of three main parts : the top, bottom, and rear ones, the latter serving, especially the housing of the driving parts, for gearing, magnetos, and the remaining apparatus.

The top part of the crankcase contains mainly the bearings of the crankshaft, of which there is one between each crank. As torsion stress is as far as possible kept off the case by the provision of counterweights at each crank, the designer had not to pay undue attention to a rigid form, and the crankcase top half appears to be carried out rather light considering the horse-power. The bearing bridges extend across the whole width, and are made as simple cross-ribs of T section, reinforced to carry the main bearing bolts and lubrication channels. By means of long through-going bearing bolts and steel caps, the bronze bearing brass with babbitt lining are mounted to the top part of the crankcase. The steel bearing covers are carefully guarded against deflection by deep ribs. Strong bronze intermediate layers between the joints allow a readjustment of the bearing brass without a remachining of the crankcase or of the steel bearing caps, and also act as a safeguard against turning.

For lubrication a round-running groove is provided in the interior of the brass, supplied with oil from the oil nozzle through two holes and a distribution groove, leading to the latter, somewhat above the joint.

The single cylinders subtend 60 deg. and are held by four bolts each fitted to four strong bosses. To avoid thread in the aluminium, studs are not used to hold the cylinders, screws with middle and bottom nuts fixed with split pins have been chosen. A safe distribution of the forces on the case is secured by a careful providing of strong ribs.

The crankcase top part is noteworthy owing to the nature of its mounting in the aircraft. Instead of the usual ledges cast on with horizontal bearing surfaces, vertical faced brackets are provided at each end of the case, to which brackets to suit to carry the engine may be affixed. The advantage of this construction is that special motor mountings can be done without, as the motor can simply rest on the fuselage longitudinals or in a corresponding auxiliary equipment provided in the body side walls, the engine itself acting as a beam, to which object the crankcase is especially adapted, as longitudinally it is very stiff between the mounting flanges. The objection that the bending stress is especially high on the case with this mounting, particularly in bad landings, which could be raised against this construction does not hold good on close study.

The crankcase lower part is mainly a deep oil sump, and is connected with the top part by means of many small square-headed screws. In cross-section it is strengthened by two strong cross-ribs. At the lowest point a flange is provided to which an oil filter is mounted. Two gauge-glasses are provided in each side. As with the joint of the two crankcase halves, the oil filter and the gauge-glasses are mounted with setscrews and nuts. Altogether threads in the

aluminium have been avoided whenever possible, which construction deserves special attention. Where necessary these setscrews are prevented from pressing during erection, as too in the oil filter mounting, by special hold rings, which are again screwed to the case by means of small setscrews without nuts.

On the rear end of the crankcase a special one-part auxiliary case is attached by a flange and studs. In this part the drives for the camshafts, magnetos, and the rest of auxiliary apparatus are housed. The magneto brackets also are separate castings, which are united to the crankcase rear part by means of studs.

Even though this extreme subdividing of the crankcase may seem somewhat intricate owing to the many faces to be machined, it affords too many advantages, as easy repair and mounting facilities. Most important, the auxiliary drives are often exposed to damage, frequently resulting in damage to the crankcase, in which case a repair by the little reliable welding procedure is necessary, if the whole crankcase has not to be abandoned at once. In the case in question one is more easily induced to sacrifice the damaged part and replace it by a new one. Thus the greater initial manufacturing costs are counterbalanced by low repair costs.

Only one single but amply dimensioned breather pipe is mounted between the cylinders on the front side of the crankcase top for ventilating the crankcase. The provision of baffle plates and a circular wire gauze strainer secures separation of the condensing oil vapours.

As already mentioned, the shaft, cranked six times in the usual way, rests in the crankcase top part in seven journal bearings. To do away as far as possible with the transverse stresses caused by the rotating masses, steel cast counterweights are mounted to each crank web by means of two stay-rods screwed into the crank web with castle nuts and cottars. These counterweights are secured against side displacement by fitting pins, screwed in. Thanks to this counterweight arrangement, the crankshaft could be kept comparatively very light by boring to a large diameter. These drillings are provided with caps, held in place by through-bolts with castle nuts and cottars. Compared with the usual rolled-in

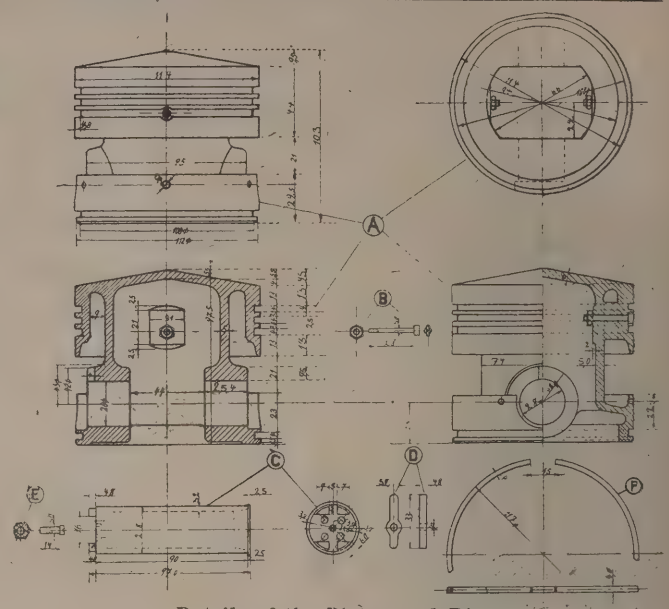
NOTE.—For further particulars of other Government Property for sale see "SURPLUS" price 3d., at bookstalls, or by quarterly subscriptions of 2s. post free, payable in advance to the Director of Publicity, Ministry of Munitions, Whitehall Place, London, S.W.1.

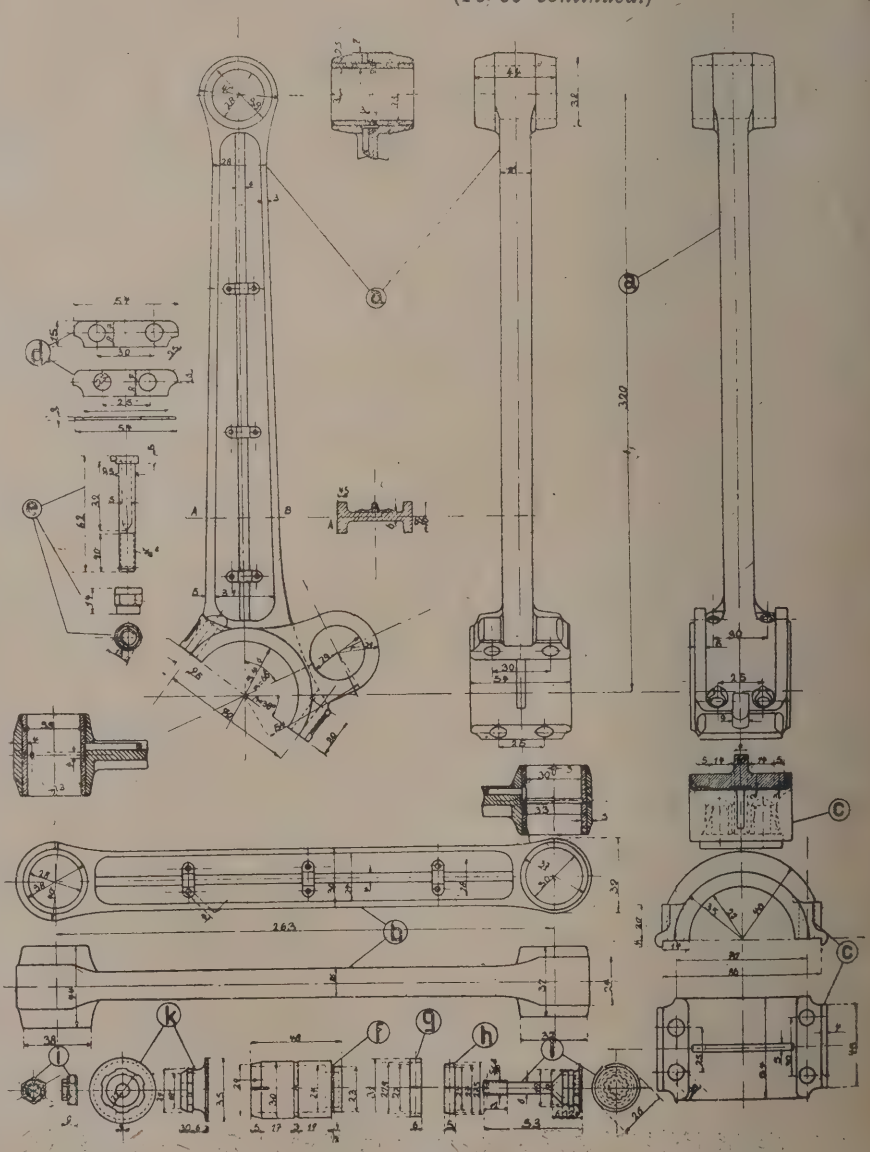


Sectional End Elevation the "Eagle" Rolls-Royce Engine.

caps, this construction permits a careful cleaning of the interior of the crankshaft, which is most necessary when dismantling after melting out a bearing, when pieces of white-metal are apt to enter the crankshaft oil-channels and cause further seizing. For the supply of lubricating oil to the connecting-rods four holes are provided in each bearing, so that an ample oil supply is certain.

At the front end the crankshaft is provided with a flange for the internally toothed gear drive wheel, and a stub shaft is pressed into the bore of the crankshaft, on which the wheel spider for the planet wheels runs. The rear end of the crankshaft is splined for the drive of the valve gearing and auxiliary apparatus.

The connecting-rods are of double T section and are articulated. The master rod is provided with no special bearing brass, but the white-metal lining is cas direct in the end of the connecting-rod. The supply of oil for lubrication of the auxiliary rod wrist pin is from the main connecting-rod bottom end bearing through an oil hole drilled in the lug of the master rod. The wrist pin itself and its bush are provided with an all-round oil groove to ensure that the oil gets to the piston pin through the lubrication tube, which is fixed to the rod with three clips.



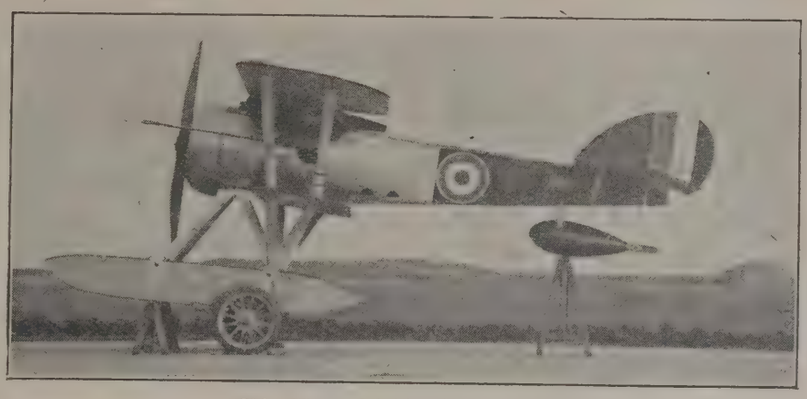
The aluminium cast pistons differ also completely from the usual model. The gudgeon pin bearings are not on the body of the piston, but on a special cylindrical part about two-thirds of the cylinder diameter. The piston guide surfaces are formed by collars projecting from this cylinder. The advantages of this design are the good transmission of the forces from the top of piston to the gudgeon pin, the low transverse stress in this part, and less liability to distortion due to longitudinal elongation of the gudgeon pin. Extraordinary, too, is the position of the gudgeon pin, almost at the lower end of the piston. At the top end of the guiding surface three cut compression rings are fitted that are prevented from turning by means of setscrews mounted in the piston with

Details of the Piston and Rings.

nuts. A fourth ring is provided in the lower end, serving here also as oilscraper ring as the part below the ring groove is 2 mm. less in diameter than the cylinder. In addition, the break in the bearing surface in the middle opposes the passing of oil into the combustion chamber. The gudgeon pin rests direct in the piston with no bushes in. At one end a small fishplate is screwed on, securing it against turning and side displacement.

(To be continued.)

Details of the Connecting Rods—the Rolls-Royce "Eagle" engine.



THE WORK OF THE MARINE EXPERIMENTAL AIRCRAFT DEPOT, ISLE OF GRAIN.—(*continued.*)

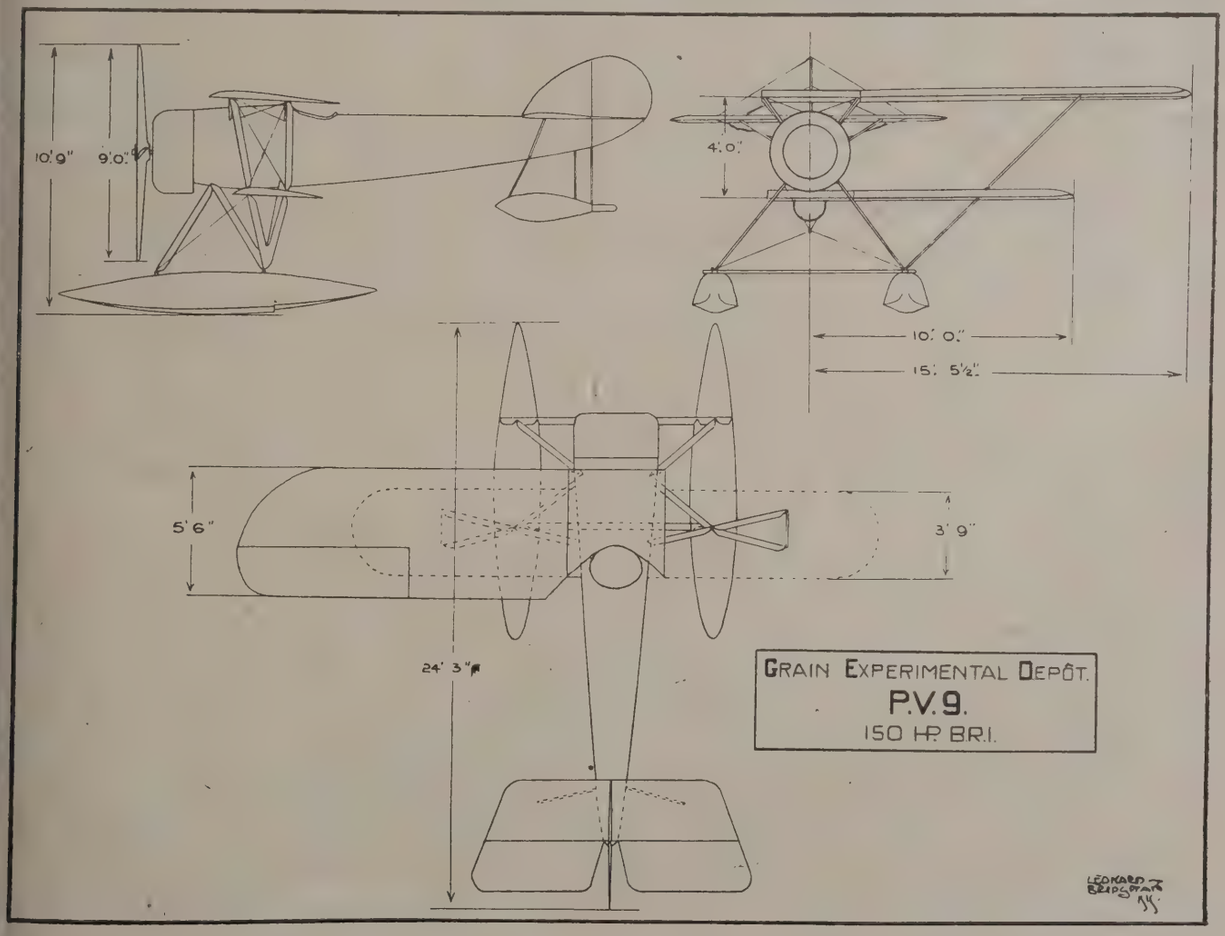
BY CAPT. W. H. SAYERS, LATE R.A.F.

P.V.9.

Whilst the "Kittens" were under construction, the drawing-office at Port Victoria were instructed to put in hand a single-seater fighter seaplane of the same general type as P.V.2, which should conserve the airworthy qualities of that machine with the excellent view which the type afforded, and should have a really high speed. The machine known as P.V.9 was accordingly designed. The engine in view was the 130-h.p. Clerget, and it was intended to use a high-lift wing and a high loading per sq. ft.

Unfortunately the prejudice against high-lift wings was then at its height, mainly because certain constructors had been instructed to use a particular brand of this type of wing with no information as to the special precautions needed to ensure success, and had turned out machines with very objectionable qualities, and the proposals of the Port Victoria design staff were turned down in this respect and instructions were given to use R.A.F. 15 section, in spite of their protest that this involved a high landing speed and a loss in climb on the limited dimensions prescribed. R.A.F. 15 was accordingly used, and the machine eventually produced was a compromise—forced on the design staff against their own judgment—with a low-lift wing fairly heavily loaded. To keep the loading to even the figure attained the machine had to be considerably enlarged and increased in weight, and although actually the machine gave very good results on tests, a very much better machine could have been built if the prejudices of pilots had not been allowed to influence the design.

Side View of P.V.9 (B.R.1 engine).



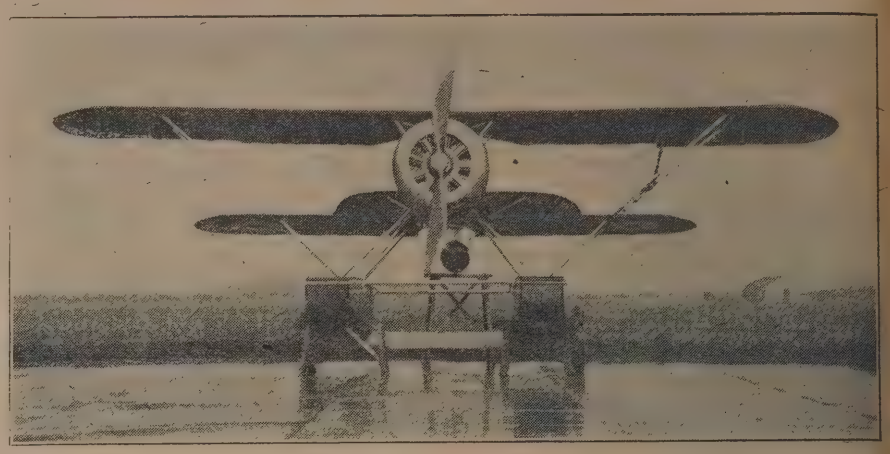
In general arrangement P.V.9 was an enlarged edition of P.V.2. The fuselage was somewhat widened and the fuel tanks were fitted one on each side of the fuselage, between the framework proper and the fairing which continued the line of the engine cowl. A very roomy cockpit was thus provided in a quite small fuselage.

A synchronised Vickers gun and a Lewis firing over the upper plane were fitted.

The wing structure was almost exactly that of P.V.2, except that the larger lower wing was supported by struts from the chassis to both front and rear spar, instead of by one only. Thus the wing struts in side elevation have the form of a V instead of the Y arrangement of P.V.2.

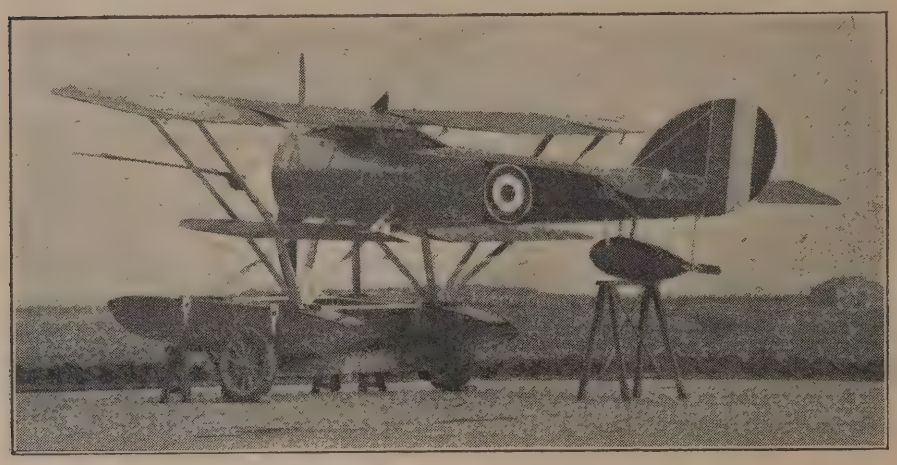
Floats of the Linton Hope type were designed for the machine, but were not in fact built, a pair of stepped pontoon floats being actually fitted.

A B.R.1 engine of 150 h.p. was installed, and the machine was flown for the first time in December, 1917. An argument with a barge delayed trials for some time, and then a series



of engine troubles prevented proper trials being carried out till some time in the middle of 1918.

The airscrew proper to the machine suffered in the affair with the barge, and the tests were finally made with an airscrew from a much lighter and faster land scout. On the climb this propeller was highly inefficient, held the engine revs. down, and knocked some three to four thousand feet off the ceiling.



The report of the trials states that it was the best seaplane scout produced till that date, but that it fulfilled no known Service need. It was some little time later that the Brandenburg monoplanes began to take toll of our big flying-boats.

The Grain Griffin.

Whilst P.V.9 was under construction a 200-h.p. Sopwith single-seater bomber was delivered to Grain with instructions to convert it into a two-seater reconnaissance machine, fitted with folding wings and wireless, for use from aeroplane ships. It was impossible to fly the machine as no radiator was delivered, and the job was to be considered urgent.

Test figures—obtained at Martlesham—were supplied showing an astonishing speed and climb with a very big bomb load, and it was wondered why the

machine was not used for its designed purpose. Bombers were in demand in those days.

Naturally enough it was found that the conversion was full of snags. The fuselage was too narrow to carry the wireless equipment with comfort, the interplane struts were just in the place to foul the tail plane when folded, and generally the machine indicated that she had no intention of suffering the proposed transformation.

The drawing-office reported that it would be quicker to design a new machine based on the bomber and build that than to carry out the alterations, and that even if altered the job would be but a botch.

They were allowed to design the machine concurrently with making the alterations to the original.

The latter involved reducing the span to bring the struts clear of the tail plane when folded, and when finally tested the altered machine had lost most of its performance, mainly because of the reduced surface involved. The test showed, however, why the machine had been turned down as it originally stood. It was impossible to produce any effect on her by means of the ailerons.

However, six machines of the modified type had been ordered from Port Victoria, and had already been christened as "Griffins," and work was put in hand from the new set of drawings. The wing spar bays had been rearranged so that struts cleared the tail without reducing the span, the fuselage had been widened, and a generally satisfactory job resulted.

A set of wings to the new drawings was rushed through and fitted to the original fuselage, together with a wheel aileron control instead of a stick, and on test the modified machine was found to have regained the lost performance to a great extent.

Lateral control was still deficient, but was adequately secured by fitting balanced ailerons.

The original machines were fitted with 200-h.p. Sunbeam "Arab" engines, but later editions carried 230-h.p. B.R.2 engines.

SPECIFICATION.

Type of machine	Folding aeroplane.
Name or type number of machine	Grain Griffin.
Purpose for which intended	Fleet reconnaissance.
Span	42 ft. 6 in.
Overall length	27 ft. 3 in.
Maximum height	10 ft. 6 in.
Chord	6 ft. 3 in.
Total surface of wings	506 sq. ft.
Engine type and h.p.	Arab Sunbeam, 207 h.p.
Weight of machine empty	1,911 lb.
Disposable load apart from fuel	538 lb.
Total weight of machine loaded	2,858 lb.
Load per sq. ft.	5.65 lb.
Weight per h.p.	13.8 lb.
Tank capacity in gallons	petrol, 50; oil, 5
PERFORMANCE—	
Speed at 5,000 ft	100 knots.
Speed at 10,000 ft.	87.5 knots.
Climb—	
To 10,000 ft.	12 min.

So far this completes the tale of Grain-built experimental machines. Whether Grain will ever again produce machines of original design seems doubtful. During the war it did interesting work, and buried in the archives of the establishment there is much useful practical information as to the design of seaplanes.

That this experience was never put to any serious use must be laid at the door of that lack of any enduring policy which has always dogged the naval side of the British Air Service.

(To be continued.)

A FRENCH NOVELTY.

It is now possible to publish a brief outline of the Damblanc and Lacoin "Alerion"—a kind of hybrid between an aeroplane and a helicopter, to which a guarded reference was made in THE AEROPLANE some months ago.

In its general lay-out the machine is a monoplane of the normal type with the wings replaced by a pair of four-bladed rotating lifting screws, with their axes lying on a line passing through the centre of gravity of the machine. These are carried from the fuselage in such a way that the inclination of their vertical axes may be altered at will by the pilot.

The angle of each blade can also be varied at will, whilst the blades are in motion, not in the manner usually associated with the variable pitch propeller but according to the exact position of the blade at any time.

Thus each blade as it passes a determined point in its path may have its incidence increased to a definite extent, and then reduced again. In this way each blade as it enters into, say, the port half of the circle in which it rotates gains an increased angle of attack and effectively the port half of that particular screw has a greater lift than the starboard half, and therefore the effective centre of lift of that screw moves towards the port side and the machine tends to bank up accordingly on that side. This both lateral and longitudinal control can be effected.

In addition to this control the machine is fitted with elevators and a rudder at the tail as in the normal aeroplane.

The four blades of each screw are built in the manner of the usual aeroplane wing, with wooden framework and fabric covering. Two engines are fitted, coupled together and clutches are fitted between the engines and the screws, or rotating wings as they properly are called.

Climbing is to be achieved by the direct lift from the rotating wings, and horizontal motion is gained by inclining the axis of the rotating wings forward, thus producing a forward component of the thrust.

Descent may be made either under power, by throttling the engines till the thrust is less than the weight, or with engines off, and with the incidence of each blade of the rotary wings reversed, when descent occurs in a manner clearly explained by Mr. M. A. S. Riach in THE AEROPLANE of March 19th, 1919. This descent may be either vertical or combined with a motion of translation according to the inclination of the axes of the rotating wings.

It is stated that the experimental machine—which is to be tested next month—has been built to the order of the French Government and that they have advanced a large sum to defray the cost of the experiment.

THE ZENITH CARBURETTER.

The popularity of the Zenith carburetter is, of course, known to every motorist, but the extent of it is perhaps hardly realised. In the issue of Nov. 1st the "Autocar" gives a list of 129 different types of cars manufactured in the United Kingdom. No fewer than 78 of these are fitted with Zenith carburetters. Of the remaining 51 types, seven use the manufacturer's own carburetter, nine do not specify a type of carburetter, and the remaining 35 types of cars divide amongst them 10 other makes of carburetters on the market. The figures tell their own story of the popularity of the Zenith.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

AMONGST THE ACCESSORIES AT OLYMPIA.

Amongst the accessories on view at the Olympia Show are many which have a direct or indirect interest to the Aircraft Industry, either because they are of actual use in that Industry, or because they are the products of firms that have contributed to the development of that Industry.

Owing to the extreme difficulty of seeing anything beyond the back of other people's necks at Olympia, the following notes on such articles are by no means complete.

Brown Bros.—At Stand 236 Messrs. Brown Bros. exhibited a colossal number of fitments of all kinds calculated to assist the automobilist in his pastime. Many of these are of direct use for purposes aeronautical, and a number of them—such as the Glow Warm Gloves, the Boyce lightning valve connector, and the Tapp petrol pourer—have been described in these pages.

The Brolt dynamo lighting and starting outfit handled by this firm is an extremely interesting affair, and it should not be impossible to apply it almost unmodified to the lighting of commercial aircraft.

Serck Radiators, Ltd.—This firm—late the Motor Radiators Manufacturing Company—of Warwick Road, Birmingham, are well known as manufacturers of radiators for aircraft, and exhibited on Stand 338 a very fine selection of radiators for cars.

H. M. Hobson, Ltd.—Claudel Hobson carburetters admittedly did their "bit" towards winning the war in the air, and since the war they have assisted at both the aeroplanes and the airships crossing of the Atlantic, and have to their credit that they vaporised upon the machines taking the first three places in the "Aerial Derby" of 1919. Samples of carburetters for all purposes, together with several varieties of Hobson Plugs, were shown by H. M. Hobson, Ltd., 29, Vauxhall Bridge Road, S.W., on Stand No. 207.

Barimar, Ltd.—The art of welding has had many applications in the realms of aeronautical engineering—and amongst welders Barimars, Ltd., undoubtedly hold a premier place. On Stand 296, those who are interested in welding—be it merely regarded as a mysterious process capable of inexplicable miracles or as a practicable method of saving money—found very much to instruct them. Barimars are amongst the firms who think, and their habits engender thought.

In addition to exhibitions of apparently impossible repairs accomplished by welding, they exhibited examples of machining and sheet metal work of the highest class.

S. Smith and Son (M.A.), Ltd.—Smith and Sons have a name dating to well before the birth of either motoring or aviation as the makers of instruments of precision. When it is considered that a very poor watch is accurate to 0.07 of one per cent., and that one of Messrs. Smith's watches in the possession of the present writer has maintained a mean accuracy thirty times greater than this for fourteen consecutive years, one feels that a Smith instrument may be considered reasonably reliable.

On Stand 345 a full range of the appliances developed by the motor accessories branch of this firm were shown.

The K.L.G. Plug—by no means a rare attachment to aero engines—is handled by this firm, and takes a high place amongst the benefits conferred upon motoring by its younger sister, aviation.

The firm also specialise in instruments for aviation purposes—though these were in little evidence on this occasion.

C. C. Wakefield and Co., Ltd.—Wakefield Lubricants of one brand or another—more particularly "Castrol R"—did their fair share towards bearing the heat and burden of war in the air. All the lines of oil and grease marketed by this firm were displayed upon Stand No. 290.

Benton and Stone, Ltd.—The Enots cork disc seated petrol valve is one of those accessories developed in response to the war-time needs of aircraft, and which is now available for use in more extensive fields. On Stand No. 266 these and numerous other products of Messrs. Benton and Stone, mostly more directly of automobile import, were found in great variety.

Auster, Ltd.—Auster Triplex windscreens have in the past added to the comfort and the security of many a pilot and observer, and will continue so to do till flying as we know it is a thing of the past. Auster screens of many varieties adapted to the more mundane pursuit of motoring, and displaying the excellence of workmanship and finish which have always characterised their aero screens, were shown on Stand 293.

Leo Ripault.—In the early days of flying, when the Gnôme engine was the engine of every designer's desire, Oleo plugs were the inevitable accompaniment of the satisfaction of that desire. To-day, though the Gnôme is no longer the only engine, Oleo plugs preserve their reputation for excellent service under the most trying conditions. On Messrs. Leo Ripault's stand, No. 353, Oleo plugs suitable for all types of petrol engines were found, together with other accessories of an equally high grade.

R. W. Coan.—When Mr. Coan began to circulate his famous statement, one who had many occasions to grope in the interior of aircraft fuselages was heard to remark that he wished Coan had cast the crankcase of the engines installed therein. Whether Mr. Coan's habits have or have not been responsible for the general decrease in the amount of filth usually associated with this part of the internal combustion engine's anatomy or not, there can be little doubt that he does know how to cast aluminium, and an inspection of Stand No. 325 demonstrated the fact.

The Vacuum Oil Co., Ltd.—Though petrol is the essential essence of motoring as of flying, these two sports resemble life in that it is their luxuries that make them worth while, and effective lubrication, in one form or another, is the essence of luxury. Thus the products of the Vacuum Oil Co., which are specialised to lubricate all but the human type of mechanism, are of the greatest interest.

Palmer Tyres.—Pneumatic tyres appertain rather to the domain of aerostatics than of aerodynamics, yet many a pilot has cause to thank the qualities of the Palmer tyres which have sustained him in that interval which elapses between the condition of aerodynamic support and an undisturbed motion in a straight line on terra-firma. Palmer cord tyres as applied to the lordly Rolls-Royce or other mere terrestrial vehicle are but a fortified edition of their aero brethren and their shrine at Stand 186 should have been the object of veneration on the part of all ex-quirks.

The British Thomson-Houston Co., Ltd.—Amongst those firms who came to the rescue of the British aero engine industry when an absence of magnetos threatened its extinction the B.T.H. Co. hold an high and honourable place, and one wishes them every success in their endeavours to extract from the motor manufacturing industry an adequate return for the expenses which they must have incurred in developing this branch of their activities. On Stand No. 326 examples of this brand of their wares were exhibited in an extremely attractive form, and those who are interested in the principles of magneto construction found this exhibit worthy of close attention.

PEACEFUL PENETRATION.

The accompanying photograph shows the All-Metal cantilever wing Junker Fokker monoplane adapted to the purpose of peaceful penetration. The cockpit has accommodation for two pilots, and in the enclosed cabin there are comfortable seating arrangements for six passengers. A machine of this type was forced to land by darkness near Dvinsk whilst attempting to fly from Berlin to Moscow and fell into the hands of the Lithuanians.

Junker Fokker Limousine.

GREAT BRITAIN.

THE DEPARTMENT OF CIVIL AVIATION.

A White Paper has been issued by the Air Ministry entitled, "Synopsis of Progress of Work in the Department of Civil Aviation (May 1st, 1919, to Oct. 31st, 1919)."

This can be purchased through any bookseller or directly from H.M. Stationery Office, Kingsway, W.C.2.

The subject of this paper will be dealt with in a future issue of THE AEROPLANE.

CIVIL AERODROMES.

The Air Ministry announced on November 10th that the following list is issued as a supplement to the lists issued on November 8th, 1919, and in addition to or amendment of those previously published :—

LIST E.

(Stations no longer in use by R.A.F.)

These stations have been passed to the Government Property Disposal Board. They will be relinquished as soon as the Government property thereon has been disposed of. In many cases the aerodromes are now under cultivation, but it is probable that the sites still form the best emergency landing grounds in the immediate neighbourhood.

Aerodrome	Nearest Railway Station.	Nearest large Town
Leighterton	Tetbury	Stroud
Lopcombe Corner	Grateley	Salisbury
Rendcombe	Foss Cross	Cirencester
Southport	Hesketh Park	Southport
Turnhouse	Turnhouse	Edinburgh

RAILWAY STATION MARKING.

The Air Ministry announced on Nov. 11th that the following "Notice to Airmen" is issued :—

"The roofs of the following railway Stations are now marked with the name of the place in large white letters :—

REDHILL.—(S.E. and C. Railway.)
TONBRIDGE.—(S.E. and C. Railway.)
ASHFORD.—(S.E. and C. Railway.)
HITCHIN.—(G.N. Railway)."

LOG BOOKS FOR CIVILIAN AVIATION.

The Air Ministry announced on Nov. 14th that, pending the production of aeroplane and engine log books conforming to the International Air Convention, log books of the type used by the Royal Air Force are on sale at 2s. net per copy. These can be purchased through H.M. Stationery Office, Westminster, S.W., or through any bookseller.

Log books conforming more closely to the requirements of the International Air Convention will be placed on sale as soon as possible.

A POSTPONED VISIT.

Major-Gen. Sir F. H. Sykes, G.B.E., K.C.B., C.M.G., has been unavoidably compelled to postpone his visit to America.

THE BERKSHIRE AVIATION CO.

The Berkshire Aviation Co., which came into existence early in May this year, was formed primarily for exhibition and passenger flying, and, in that capacity, has been giving demonstrations in most of the Midland and Southern County towns.

The personnel are all ex-Service people. Mr. J. D. V. Holmes, late R.F.C., served in France with No. 19 Squadron, and in May, 1917, was shot down and taken prisoner, remaining in Germany until repatriation last December.

When demobilised he went into partnership with Mr. Alan Cobham, another ex-R.F.C. Officer, who was three years with the Artillery of the Lahore Division of the Indian Army in France and Flanders, before being transferred to the Royal Flying Corps—in which he was an instructor.

Mr. Fred Holmes, late R.N.A.S., is another partner. He was with Messrs. A. V. Roe and Co. for three years before the war, and accompanied Mr. Raynham in the latter's famous "Daily Mail" seaplane tour round Britain.

The machines used are 110 h.p. Le Rhône Avros, with two passenger seats. So far, they have visited nearly 30 different places, including Oxford, Swindon, Reading, Northampton, Bedford, Leicester, Loughborough, Nottingham, Derby, Stoke-on-Trent, Chesterfield, Leamington Spa, Rugby, Coventry, Shrewsbury, and Kidderminster. During the week ending Nov. 16th they were to fly at Bradford.

The Berkshire Aviation Co. have given flights in conjunction with the "Daily News," "Nottingham Journal" and "Nottingham Evening News," and claim the World's record for any single machine of this type by having carried nearly four thousand passengers this season.

THE CONTINENTAL AIR SERVICES

THE AIRCO SERVICE.

During the past week ending Nov 15th the weather has continued to be unfit for flying. Out of 181 scheduled flights 159 have been accomplished. Twelve have been prevented, and seven interrupted by the weather. Three have been interrupted by mechanical defects.

Date.	Type.	Pilot.	Left Hounslow	Arr. Paris.	Left Paris.	Arr. Hounslow.	Pass.
Nov. 10th	D.H. 4a	Lt. McMullin	12.30 p.m.	Landed Hounslow 12.45 p.m.			Mail 8 bags
Nov. 11th	D.H. 4a	Lt. McMullin	12.35 p.m.	3.00 p m.			1 and Mail
	D.H. 4a	Lt. Campbell-Orde			12 30 p.m.	2 40 p.m.	0
	D.H. 16	Lt. Lindley			12.45 p.m.	Landed Kenley 3 45 p.m.	Mail
Nov. 12th	D H. 9	Lt Lawford	12.45 p.m.	3.14 p.m.			Mail
	D.H. 16	Capt. Baylis	1.00 p.m.	3.30 p.m.			4
	D.H, 4a	Lt. Armstrong			12.30 p.m.	3 30 p.m.	1 and Mail
Nov. 13th	D.H. 4a	Lt. Powell	12.30 p.m.	3.15 p.m.			Mail
Nov. 14th	D.H. 16	Lt. Tebbit	12.30 p.m.	Landed in France			Mail
	D.H. 4a	Lt. McMull'n			12.30 p.m.	2.45 p.m.	1
	D.H. 9	Lt. Lawford			12.30 p.m	2.45 p m.	0
Nov 15th	D.H. 4a	Lt. Campbell-Orde	12.30 p.m,	L'mpne 1.20 p.m.			1 and Mail

On Nov. 10th, 13th, and 15th, no machines started from Paris on account of adverse weather conditions.

On Nov. 11th the D.H.16, which started from Paris, was forced to descend at Kenley owing to petrol shortage.

On Nov. 14th the D.H.16, which started from Hounslow, was forced to descend twenty miles short of Paris owing to thick fog. The mails and parcels were taken into Paris by road.

Each Airco pilot, flying between London and Paris, now carries with him a list of transport agents in towns on the route both in England and France, whose task it is, should a mail-carrying aeroplane have a forced landing in their vicinity, to take every possible step to see that the mail-bags continue upon their journeys with the least possible delay.

On a telephone message from a pilot, stating where he has alighted, the nearest of these agents will pick up the mails by means of a fast motor-cycle and take them to the nearest railway station, where the next through express will be stopped in order to put them on board. If rail connections are not suitable, then the aerial mail will go on its way by road. In the event of an air-mail pilot having to make a compulsory descent in the Channel, the Lympne Air Station, by telephoning to Dover, will be able to send out a relief patrol boat in a few minutes. Both the Airco air-mail machines and the bags containing the mails are fitted with a special flotation gear.

THE HANDLEY PAGE SERVICE.

A machine flew from Paris to London on Nov. 11th with passengers and freight, passing through thick fog when over the Channel. Another Handley Page machine flew from London to Brussels with three passengers, 1,069 lb. of freight, and a large model of a Handley Page aeroplane, which is to be exhibited in the Belgian capital. The machine which left London for Paris returned after several ineffectual attempts to penetrate the fog over the Channel.

On Nov. 12th a machine left Hounslow for Paris at 11.25 a.m. carrying one passenger and 240 lb. freight. A second Handley Page biplane left Hounslow for Brussels at 12.20 p.m. with 1,829 lb. of freight. A machine returned from Brussels, starting at 10.50 a.m. with one passenger. Hounslow was reached at 1.50 p.m.

During the week ending Nov. 12th twenty passengers and 779¾ lb. of freight were carried on the London-Paris service. On several occasions the machine started from Hounslow fully loaded, but had to turn back at the Channel after several ineffective attempts to penetrate low clouds and fog.

During the same period ten passengers and 2,969 lb. of freight were carried on the London-Brussels air service.

On Nov. 14th the machines carried out their scheduled flights despite very severe snowstorms. Lieut. MacIntosh flew from Paris to London with passengers and freight in 3 hr. 28 min., and Lieut. Hope arrived from Brussels after a journey of 3 hr. 15 min.

Since the restrictions on the carrying of goods to Belgium have been removed large quantities of freight have been carried, including women's dress, crepe de chine tea-gowns, boudoir caps, feathers and furs.

The unique view of the Flanders battlefields which is enjoyed by travellers on the London-Brussels air service has resulted in many passengers making the journey in order to view the Ypres salient, the shell-scarred area of the Menin Road, the battered town of Menin, and the picturesque cities of Ghent and Bruges.

As soon as Customs offices have been erected Cricklewood Aerodrome will be the departure and arrival centre for the Handley Page aeroplanes carrying out air services between London, Paris, and Brussels. Searchlights and flares have been installed for night-flying.

BRIGHTON.

The Rev. S. Stanley Shergold, describing in a sermon how Sunday is spent in Brighton, said :—

"There is an enormous amount of absolutely unnecessary and unprofitable labour which is of great detriment to the bodies and souls of our fellow townsmen."

Mr. Shergold went on to allude to what he described as the prostitution of the day for great gain by panderers to the taste of the public. There was an aeroplane company, with a local aerodrome, which regarded Sunday as the day par excellence for joy-rides.

It might be suggested that Mr. Shergold's habit of prostituting the same day to pander to the public's partiality for piffling platitude of the above character has also the incentive of gain—though one must infer that his gains are not great.

The Rest Day Association is appealing to the East Sussex County Council to stop the Sunday flying at West Blatchington, on the ground that it constitutes "an affront to the religious feelings of the people."

BROOKLANDS.

The manufacturers of the A.B.C. aeronautical engines are Walton Motors, Ltd., and not the Walton Motor Car Co., as erroneously stated in last week's issue of THE AEROPLANE.

EDINBURGH.

On Oct. 25th Aitken, Melrose and Co., Ltd., of Forth Street, Edinburgh, delivered supplies of tea to Dundee firms by air. The machine, an Avro biplane named "The Advertiser," was loaded at Turnhouse Aerodrome. The pilot was one Lieut. Jones, and the flight to Lochee Park, Dundee, was made in 30 mins.

Lord Provost Sir William Don, the town clerk, and magistrates of Dundee were present when the aeroplane arrived, and each was presented with a casket of tea to commemorate the event. The remainder of the tea was delivered to the local agents by motor-cars.

HULL.

The North Sea Aerial and General Transport, Ltd., has in the last few months flown machines between London and Glasgow, Liverpool, Leeds and Hull, and given displays at Scarborough and Amsterdam. The company has also carried goods and passengers between Hull and the Continent.

In the last three months over 400 successful flights have been made with a total approximate mileage of 12,000 miles. Just short of 2,000 passengers were carried, and over 12,000 lb. of goods. This work was performed without a single accident of any sort either to passengers or machines. The machines used were of the Blackburn "Kangaroo" commercial type.

LONDON.

Vickers, Ltd., write that during the past summer they have undertaken certain commercial services, in particular a service of three or four machines which visited some of the principal towns in England.

The firm think, therefore, that the position is more hopeful than would appear at first sight. An interest has been created and the public is really only waiting for practical services to be initiated between points carefully selected from the point of view of aviation.

The heavy depreciation of rolling-stock, the shortage of shipping, and the scarcity of motor transport, caused principally through the exigencies of the war, are all in favour of the early development of civil aviation. Aircraft manufacturers are faced with the task of converting the impetus they received during the war into a healthy peace industry.

The firm expects that several years will elapse before the very best types of machines have been evolved, which will require both scientific study and practical experience, and therefore during this period the various works will of necessity not be producing at their maximum capacity.

The firm have also to examine into the correct relation of the aeroplane and the airship. In view of these facts they are directing a proportion of their energies to other kinds of manufactures, although they are in the fortunate position of having a large contract for machines recently received from China.

At the E.L.T.A.—The Queen-Mother of Holland visiting the Vickers Stand at the E.L.T.A. at Amsterdam.

HOUNSLOW.—A Mr. Willars Peterson was a passenger on the belated Cunarder "Maurefania," and was due in Copenhagen before the liner reached England. He sent a wireless message while in mid-Atlantic to his representative in London to arrange for an aeroplane to convey him to Denmark. The representative communicated with the Lep Aerial Travel Bureau, who arranged with Lieut.-Col. G. L. P. Henderson, M.C., A.F.C., to make the flight.

Mr. Petersen arrived in London on the night of Nov. 10th and was introduced to Col. Henderson, and it was arranged that a start should be made at 6 o'clock on the next morning.

They started on the Armstrong-Whitworth machine belonging to Col. Henderson on Nov. 11th for Copenhagen, but a landing had to be made at Hamburg in the evening owing to a snowstorm.

On November 15th Lieutenant Lindley, piloting an Airco D.H.9a, left Hounslow at 12 noon with one passerger *en route* for Brussels, but owing to extremely adverse weather conditions was compelled to alight at Lympne.

NORTHOLT.—Miss McMaugh, an Australian nurse, after only a month's training, successfully passed her tests at the Central Aircraft Company's Aerodrome at Northolt on Nov. 15th, and received the Royal Aero Club's pilot's certificate. She flew a Centaur IV machine, designed and constructed by the Central Aircraft Company.

Miss McMaugh has been working as a Red Cross nurse in France, attached to the A.I.F. It is claimed that she is the first Australian woman to take the certificate, and the first woman in England to become a pilot since the outbreak of war.

SHEFFIELD.

A correspondent to the "Yorkshire Observer" of Nov. 7th writes :—

"The rumour that two of Sheffield's largest engineering

Round the world by Air

is mainly a question of organisation and *choice of flying stock*. As to the second factor, the B.A.T. Company can be of unusual assistance.

For instance, we are the first people out with a purely commercial model (not a modified war type)—the B.A.T., F.K.26—the machine with the largest cargo space and load capacity for its overall size and power yet produced.

Here are some interesting points concerning F.K.26:—

ENGINE:—Rolls-Royce Eagle VIII.

SPEED:—45-120 m.p.h.

CABIN:—Is clear of any transverse cross bracings or other obstruction, and measures 8 ft. by 3 ft. 3 ins. by 6 ft.—this in a machine of only 33 ft. overall length. Direct entry off ground through ordinary door.

LOAD:—With 600 mile range of fuel—2,000 lbs.

FUEL COST AT FULL LOAD:—7½ pence per mile.

CHASSIS:—A sturdy job, sprung by an unique combination of oleo and rubber shock absorbers.

TAIL:—Can be trimmed in flight from pilot's seat—steering and practically unbreakable tail skid.

GENERAL CONSTRUCTION:—Straightforward—simple to repair and recondition.

A series of these machines is in production. Governments and prospective owners desiring a fleet of these machines—or a single one—are invited to forward their enquiries.

Complete particulars on application to:—

The BRITISH AERIAL TRANSPORT CO. LTD.
38, CONDUIT STREET, LONDON W. 1.

Miss H. McMaugh, who recently took her certificate at the Central Aircraft Co.'s School at Northolt.

firms had been negotiating for the purchase of the Coal Aston Aerodrome is supported by the latest development.

The Corporation, it is authentically stated, has been asked by the Air Ministry if it is prepared to take over the aerodrome as a municipal aerodrome for the city.

"The Development Committee urges that the retention of the aerodrome is of the utmost importance, and has decided to call a conference of local manufacturers to consider the matter, in conjunction with the question of promoting a regular air service to and from Sheffield."

WESTON-SUPER-MARE.

The Urban District Council, advised by the Sands Committee, have refused a renewal of flying rights from the sands for next year to A. V. Roe and Co., Ltd., and a similar concession to the Warwick Aviation Co.

More than 3,000 passengers were carried by A. V. Roe and Co., Ltd., in the past summer. The Golf Club object to the flying on account of the damage done by crowds, etc. Certain residents also object to the aeroplanes flying over their houses. It is said that there is a general desire on the part of the public for a continuance of the flying, but the Council is reactionary and unenlightened.

SOUTH AFRICA.

Mention was made of the amalgamation of two aeronautical companies in the Nov. 5th issue of THE AEROPLANE. Further details of the officers in the new company have now been obtained.

One of the Chiefs of South African Aerial Transports, Ltd., is Colonel R. S. Armes, C.M.G. Latterly, he was an Air Council representative in the British Section of the Supreme War Council at Versailles, and a Chief Staff Officer in the Department of the Inspector-General, R.A.F.

Col. Armes has passed through the Staff College at Camberley and the School of Economics, London University. Since 1914 he has been a Company Commander, a Staff Officer at Headquarters, 2nd Army, on the Staff of Air Vice-Marshal (then Colonel) Sir J. M. Salmond, and in the Directorate of Military Aeronautics.

Major Allister Miller, D.S.O., is another of the Chiefs. He made the first cross-country flights in South Africa in a recruiting campaign for the R.F.C. On his return to England, Major Miller was selected as an officer in the Independent Force, fighting squadron, and shortly before the Armistice was flying a Sopwith "Snipe" machine.

Major F. W. Honnet joined the R.F.C. in 1915, graduated as a pilot in Jan., 1916, and proceeded to France with 24th Squadron. He afterwards became a Flight Commander, a Brigade Fighting Instructor, and a Home Defence Squadron Commander. It is claimed that Major Honnet was the first pilot to fly a Scout machine (a "Camel") at night. At Stonehenge he underwent a special Navigation Course, with a view to pioneering on the Cape to Cairo route, but owing to ill-health he had to give up the project.

Major W. E. Young, D.F.C., served as an observer and pilot in the R.F.C. on the Western Front. He commanded No. 1 Squadron in France, and, after the Armistice, a Handley Page Squadron employed on an Aerial Mail Service between Boulogne and Cologne.

Lieut. C. R. Thompson, D.F.C., was one of Major Miller's pupils.

Lieut. L. E. Rutherford was also one of Major Miller's pupils, and was for two years a flying instructor in the R.F.C. and R.A.F.

Capt. C. G. Ross, D.F.C., was gazetted Flight Commander in 1918. He was awarded the D.F.C., bar, and Croix de Guerre (Belge), for services on the Western Front.

The following is extracted from the Johannesburg "Star" of Oct. 16th, and relates to information issued by South African Aerial Transports, Ltd. :—

"The circular is something amusing when it sets out to explain 'airisms' for the 'benefit of the uninitiated'—quite solemnly; and quotes five of them: 'Flip,' 'ceiling,' 'stunts,' 'joy-stick,' taxi-ing.'

"I hereby add to the joy-list—it seems so inadequate for instruction or amusement :—

"To suffer from a vertical gust; or, to get the wind up; to have a dud day; to be a Quirk or Hun; to have one's tail up; to hear from old 'Boom'; to have cold feet; to zoom; to lose a prop.; to swing the lead (applicable to A.M.'s only); to call a chap 'old bean' (the password of the Corps!).

"These are but random additions; the full slang dictionary is too long; and some of it is uninkable!"

THE ARGENTINE.

Major S. G. Kingsley is the representative of Aircraft Transport and Travel, Ltd., in the Argentine. The following information is extracted from an article written by him which appeared in the Buenos Aires "Standard" of July 25th :—

The De Havilland biplane which Major Kingsley has taken out to Uruguay is a demonstration machine, with which he hopes to familiarise the country with the idea of utilising the aeroplane as a time-saving and comfort-giving device, to enter into the everyday lives of the inhabitants and increase their business. The first aircraft company to start in the country on properly organised lines will find a very profitable field to develop.

The routes that such a service would cover are frequently visited by cattle buyers and business men from Montevideo. The towns are situated in fertile districts, the development of which are seriously retarded by the lack of adequate communication. After heavy rains it is impossible now to get from one town to another, owing to the flooding of the rivers and the bad state of the roads.

Once aerial transport is established in Uruguay, it will be possible to travel from Montevideo to any point in the Republic, transact business and arrive back in the capital within the day. It will likewise be possible to write a letter in the morning to a client in any part of the country, give him several hours in which to answer it, and receive a reply before the closing hour of the business houses. A buyer of cattle will be able to visit four live-stock breeding centres or fairs in the time it now takes to visit one : in other words, one man will do the work now being done by four.

On July 15th Major Kingsley flew from Buenos Aires to Cordoba. He previously sent a telegram asking that the landing ground might be marked out, but the telegram arrived one hour after Major Kingsley had alighted safely on very bad ground.

On the following day he decided to make an ascent in order to find a spot better fitted for a temporary flying-ground. The race track was chosen, and Major Kingsley was informed that the ground was hard for its whole length. Whilst taking off the machine ran on to a soft patch of loose sand. The left wheel buried itself up to the axle. The machine swerved and ran into a wire fence. Slight damage was caused, but it was not expected that it would take long to put right.

Five more De Havilland machines were expected from England at the beginning of September. One a D.H.16, with 375 h.p. Rolls-Royce engine, and the other four, two-seater biplanes of a light type.

DENMARK.

The Danish correspondent of THE AEROPLANE writes :—

GERMAN DESIGNS.

After the landing last autumn in a Danish harbour of a modern Brandenburg sea-biplane, from which the monoplane edition was derived, the Royal Dockyard at Copenhagen built a copy. A 160-h.p. Benz-engined Brandenburg sea-monoplane was also bought from Germany after the Armistice.—HI.

FRANCE.

THE PARIS-MELBOURNE FLIGHTS.

M. Poulet and his mechanic, Benoit, reached Karachi on Nov. 13th after an adventurous journey. They landed en route, and were promptly attacked by natives, who mistook them for "devils." They were forced to use arms in self-defence. —No further news has arrived as to their later movements.

LIEUT. CASALE IN NEW WORK.

Lieut. Casale has left the Nieuport firm and is going to fly on a Breguet limousine biplane to Alexandria, where he intends to open an aviation business.

THE ELECTIONS.

M. Louis Breguet is standing for the Chambre des Deputés in the Department du Nord. Capt. Fonck, whose prowess in the war needs no new historian, has been elected by the constituents of his native province in the Vosges. Capt. Heurteaux, who is also well known in official aviation circles, has also been elected.

GERMANY.

A NEW MAIL SERVICE.

According to the "Times" of Nov. 14th, an aeroplane carrying the first aerial post from Berlin to Königsberg has arrived at Königsberg after a flight of six hours.

ANOTHER "BODENSEE."

According to the "Times" of Nov. 17th, the German Aerial Company have placed orders for the construction of a new passenger airship of the Bodensee type.

THE AIRSHIP "BODENSEE."

During the twelve days' suspension of the railways the "Bodensee" is carrying the mails to South Germany and Switzerland. On Nov. 11th the airship left Friedrichshafen for Berlin, carrying twenty-four passengers and 1,760 lb. of mails. After flying some sixty-two miles it encountered a driving snowstorm, but maintained its course, being steered by the compass. The journey of some 437 miles took five hours.

The "Bodensee" left Berlin again on Nov. 12th with a ton of mails and urgent telegrams for the South. The mails by airship reach their destination in six hours, instead of twenty-five or more when sent by the ordinary route.

HOLLAND.

A correspondent writes :—

PROPOSED AERODROMES.

The management of the international aviation enterprise at Amsterdam has chosen, in concurrence with the Aviation Committee of the Deventer Town Council, a site for an aerodrome on the road between Deventer and Zutphen. It is hoped to begin work on the aerodrome, the erection of hangars, etc., in April next.

Lieut. Aviator L. J. M. Hofstee gave a lecture at Deventer, in the course of which he said that the Government is working out a plan for the institution of an international aerodrome (or, as the Dutch say, "a flying harbour") at Amsterdam, which is to cost six or seven million guldens. The Aviation Law, which is in preparation, said the speaker, will appoint as Customs station the first place in the eastern part of Holland which is ready with an aerodrome.

A LONDON-HAGUE AIR SERVICE.

We hear, says the "N. Rott. Courant," that on the 10th of this month a regular flying service will be opened between Holland and London from some grounds belonging to Mr. Kröller lying on the Maaldrift, near Loosduinen, which is a small place quite close to The Hague.—N. C.

This service is to be run by Aircraft Travel and Transport, Ltd., but did not start on Nov. 10th.

SWEDEN.

117 MILES PER HOUR.

Lieut. Maddalena, an Italian aviator, flew from Stockholm to Helsingfors on Nov. 10th in 2 hr. 20 min. The distance is about 440 kilometres.

AN ITALIAN GIFT.

Two Italian seaplanes which were flown to Stockholm have been presented by the Italian to the Swedish Government.

BRIDGE FLYING.

Captain Saunders (late R.N.A.S.), a pilot in the Swedish P.O. Flygkompani, flew a D.H.6 biplane under the arch of a railway bridge near Stockholm on Oct. 27th. Other attempts to fly through this bridge have failed, as the passage is difficult and bordered by high mountains.

It appears that for some days certain Italian aviators had been advertised to fly under the bridge, and as they delayed so long Capt. Saunders proceeded to do it.

The Danish correspondent of THE AEROPLANE writes :—

Capt. Saunders crossed Skuru Sound by Stockholm. The bridge has a span of 57 metres on the water-line, and is built in a semicircular form with a radius of about 30 metres.

SWITZERLAND.

THE AERIAL POST.

The aerial post recently maintained between Zurich, Berne, Lausanne, and Geneva ceased on Nov. 1st last.

THE INJURIES OF CAPT. BRADLEY.

Capt. Eric Bradley, who was previously reported to have crashed at Nyon in an Avro biplane whilst flying with a passenger, was still in hospital at Nyon on Nov. 10th. His injuries have been found to be more serious than was reported at first.

UNITED STATES OF AMERICA.

A Reuter message from Mineola, Long Island, dated Nov. 14th, stated that Vice-Admiral Mark Kerr, in a Handley Page aeroplane, left there shortly after 7 a.m. on that date for a non-stop flight to Chicago. He was carrying eight passengers and 1,500 lb. of express mail matter, and estimated that the flight would take ten hours.

The machine was piloted by Major Brackley, of the R.A.F. It was intended to start before daybreak, but the cold weather had chilled the engine and thus delayed the departure.

A Reuter message from Ohio, dated Nov. 16th, stated that the machine made a forced landing at Mount Jewett, Penna, on that date, and was so badly damaged that new parts will have to be obtained from England.

GOLF AND THE ROYAL AERO CLUB.

The members of the Royal Aero Club held an 18-holes competition over the Addington Club's course on Nov. 18th. The competitors included Lieut.-Col. J. T. C. Moore-Brabazon, Commander W. Briggs, Lieut.-Commander H. E. Perrin (secretary of the Royal Aero Club), Lieut.-Col. F. R. McClean, and Major S. V. Sippe.

OUR CARELESS SECRECY.

Speaking of the war work of Dorman, the celebrated engine makers of Stafford, the "Daily Chronicle," in a short article on the Olympia Motor Show, says : "During the war Messrs. Dorman produced, under the seal of secrecy, the interrupter gear, which enabled machine-guns mounted on an aeroplane to fire between the propeller blades of enemy aircraft."

This is very interesting, but before this wonderful gear was invented, what a time our poor pilots and gunners must have had, relying entirely on their quickness of eye to snipe a Hun through his propeller.

"MANY INVENTIONS."

Sister Hilda McMaugh, the first Australian woman to fly, in an interview to a representative of the "Daily Mail" gave a few experiences of her course of instruction at the Central Aircraft School. She said, "I've only had one mishap; that was yesterday, when a farmer drove a cart right across my landing track and I touched it with a wing. For a moment I though it was all up with the machine, but I pulled the right stick and saved myself. It's all a question of pulling the right stick." One doesn't quite grasp the function of the right stick. Did it withdraw the wing, push the cart out of the way or whisk plucky Miss McMaugh out of the machine into safety by a patent quick-release catapult-cum-parachute device?

ONE USE FOR A WORKSHOP.

A dinner, given on Nov. 11th, at Byfleet, to returned Service men, was held in one of Mr. W. G. Tarrant's aeroplane shops, where the Tarrant triplane was first built. The cloakroom was another shop, and the top half of a wooden fuselage was utilised for placing overcoats, etc., thereon. There appears to be little activity as regards aircraft in this establishment, although the works are large and suitable for construction.—J. F. S.

A CHANGE OF ADDRESS.

The Aeronautical Intelligence Bureau, Ltd., late of Bedford Row, W.C.2, wish it to be noted that they have recently moved into more commodious offices at 50, Jermyn Street, S.W.1, and that in future all communications should be addressed there. The temporary telephone number is Gerrard 1060.

Fine Grain Means Quality.

The best wood has the finest grain, and grain in steel is equally a test of quality. That is why

Edgar Allen's

Red Label Steel

can be trusted to do its work efficiently. Examination of a fractured piece reveals a silken surface. Owing to the presence of a small percentage of tungsten in its composition, this steel offers far greater torsional resistance than any ordinary carbon tool steel. This, together with its uniformity, makes it ideal for Reamers, Threading and Screwing Dies, Broaches, etc., etc.

AIRCRAFT IN PARLIAMENT

The following written answers were given on Nov. 10th :—

ROYAL AIRCRAFT ESTABLISHMENT, FARNBOROUGH (DISCHARGED APPRENTICES).

Viscount WOLMER asked the Under Secretary of State to the Air Ministry whether he is aware that a number of lads are being discharged from the Royal Aircraft Establishment, Farnborough, before they have completed their apprenticeship.

Mr. KELLAWAY : I have been asked to answer this question. No lads of the apprentice class (excepting nine who were dispensed with as unsuitable) have been discharged, and, in spite of the drastic reduction in the personnel of the Royal Aircraft Establishment, I hope that the necessity for discharging any lads of that class will be avoided. 195 lads have been discharged since the Armistice who were originally engaged as office boys, messengers, etc., but who were subsequently drafted into the shops and given an opportunity of learning a trade.

ORDNANCE SURVEY (AERIAL PHOTOGRAPHY).

Sir A. BOSCAWEN, the Parliamentary Secretary to the Board of Agriculture, replying to Lieut.-Col. Moore-Brabazon, said :—The application of aerial photography to peace surveys is being carefully studied by the Ordnance Survey, but at present the process is generally more expensive than normal methods, and less accurate. The Ordnance Survey has full information on the subject, and is in touch with those who carried out air surveys on the Western Front and elsewhere. Some of these officers are now on the Ordnance Survey staff.

* * *

The following oral answer was given on Nov. 11th :—

AIR MINISTRY—MAJOR-GEN. SEELY.

Mr. BILLING : Have the Government received the resignation of the Secretary of State for Air ? Have any reasons been given for it, and, if so, what ? And has the resignation been accepted ?

Mr. BONAR LAW : I would rather not make any statement to the House on this subject. It is possible the hon. Member's information is right. If so, I would rather the statement was made by the Under Secretary for Air himself.

* * *

The following oral answer was given on Nov. 12th :—

AIR SERVICE.

Capt. WEDGWOOD BENN (by Private Notice) asked the Prime Minister whether the Government adheres to its pledge to maintain the unity of the Air Service.

Mr. BONAR LAW : The answer is in the affirmative.

The following written answer was given on Nov. 12th :—

ROYAL AIR FORCE RESERVE.

Lieut.-Col. POWNALL asked the Secretary of State for War whether, in connection with the organisation of the Territorial Force, he will consider the advisability of arrangements being made by which civil aviators can be formed into a branch of the Territorial Force Reserve, in order that their services may be utilised in case of national emergency.

Mr. CHURCHILL : No such proposal has been considered in connection with the organisation of the Territorial Force, but the question of the formation of a Royal Air Force Reserve is at present under consideration.

* * *

The following personal statement was made on Nov. 12th :—

RESIGNATION OF MAJOR-GENERAL SEELY.

Major-Gen. SEELY (speaking from the Front Opposition Bench) : The House generally wishes to know the reason for the retirement of any of its Members from the Ministry and in a very few words I will endeavour to tell the House the reasons which have impelled me to resign the high position which I have hitherto held.

When the Government was first formed the Prime Minister asked me to go to the Air Ministry, and in a curious phrase, as announced officially, to "preside over the Council." It was a curious arrangement in that the right hon. Gentleman opposite (Mr. Churchill) was to hold the seals of both offices as Secretary of State for both War and Air. It had the obvious anomaly that the Admiralty was left out of the business altogether.

But I accepted it because I had a very deep interest in the Air business for a very long time. Indeed, I was charged by Mr. Asquith, then Prime Minister, with the task of being President of the Committee of Imperial Defence, which laid the foundation of our present Air Service. Also we were not then at peace with Germany, and I thought it my duty to take any office in which one could be of service

It involved, obviously, the dangers of dual control. Dual control is a dangerous thing anywhere, and, as my right hon. friend the Secretary of State for War would be the first to admit, it is peculiarly dangerous in the air.

Nevertheless, I undertook the duty gladly, and endeavoured to work it, but it very soon became apparent that the thing would not work, not for any personal reason, but because by actual fact and by statute the only man who can preside over the council is the Secretary of State. He cannot divorce himself from his responsibility, even if he wishes to do so.

All questions such as these, submissions to the Sovereign, memoranda to the Cabinet, dealings with the responsible heads of other Government Departments, where any question of controversy arises, and, above all, on questions of high policy, must be the duty of the Secretary of State, and of him alone.

As soon as this became apparent I informed the Leader of the House, through my noble friend the Member for Chichester (Lord Edmund Talbot) that the arrangement was bound to be inefficient and wasteful and that I would ask for a change. He begged me to wait until after peace was made with Germany. I accordingly did so.

When the Prime Minister returned in July I then put the case before him, and in very precise terms stated that the present arrangement for the reasons I have shortly given, was one which I thought was not in the interests of the State, and, above all, inimical to the interests of the Air Service, and I asked for a change.

The decision was delayed, first owing to the Prime Minister's absence in France, having a much-needed rest, and then owing to the railway strike. The matter came up finally for decision twelve days ago. The Prime Minister treated me with the utmost courtesy and consideration, begged me to reconsider my position, and finally told me that he had decided on the present plan after due consideration and that he did not propose to abandon it.

The only possible course for me to take, as I am sure the House will agree, whoever of the two of us was right, was for me to resign and be no longer responsible for an arrangement which I was convinced was wasteful and inefficient.

There is no personal question involved. There is no personal question between myself and my right hon. friend the Secretary of State for War. If any man could have done two things he could have done, with his boundless industry. I have never met so industrious a man—and with his care for the Air Service as a whole, than whom it has had no better friend. If any man could have done it he would have done it, but the thing is obviously impossible.

The War Office is a whole-time job, as I have reason to know, and the duty of the Secretary of State for Air—this service, with its vast possibilities—is a whole-time job, too. A man cannot be in two places at once, even if he is the Air Minister. The very fact that the offices are distinct, that the Air Ministry is a distinct office, makes it quite impossible for the responsible head of one to be also the responsible head of the other.

Still less is there any personal difficulty in the Air Ministry itself. I can say truly, and I have had some experience of public life, that never has a man been so faithfully served by loyal and devoted servants as I have been in my position by the members of the Air Council, and especially by Sir Hugh Trenchard and General Sykes, whom I think the State is fortunate in having at the head of their respective Departments.

The issue involved is very clear and very definite and involves questions of vast importance. By deciding as the Prime Minister has done that the Air Ministry is to receive its guidance from its responsible head, from a man who can only give a fraction of his time to it, it seems to me that three certain consequences follow.

First of all, because such a man, however industrious, cannot possibly give enough time to enable business to be efficiently conducted, it must mean delay, and delay must mean waste—waste of time, waste of energy, waste of money. Secondly, the fact that the Admiralty is left out of the business must make it difficult to work in with that great Department.

How can the First Lord of the Admiralty appeal to the Air Ministry for a proper allocation of funds and a proper allocation of energy, with the infinite possibilities of air effort in regard to the Navy, when all the time he finds that the man he is addressing is the Secretary of State for War ?

Over and above all, the result of this decision must be that the Air Ministry is condemned definitely to be a subordinate office and an annexe of the War Office, with results, I am sure, inimical to the good of this country. We must be involved in waste of our commercial possibilities. We must be involved in waste of money on a gigantic scale by not taking advantage of the new inventions and of the new power that the air has given us, to enable us to undertake our great and increased responsibilities throughout the world.

If anybody doubts that, let him consider what is the possibility of the air. One aeroplane has saved a war in Arghanistan, and in future aeroplanes may do much more. If it be said, on the plea of economy, that it is wise to combine the offices, then I would say that it is wasteful in the extreme.

We cannot possibly hope to maintain our position throughout the world, unless we use science to the utmost, and especially the science of the air. I could no longer consent to agree to a plan which I thought would have these fatal results, and I so told the Prime Minister.

Believing as I do that the result must be a loss of millions of money and thousands of lives, I asked him to relieve me of that duty. He may say that he knows better. He may say that this is the old dispute between brigade headquarters and general headquarters, and that from that there can be no appeal. In that case there is no appeal, but here there is an appeal. There is an appeal to this House, and to this House, accordingly, I appeal.

Lord HUGH CECIL : In view of the importance of the statement to which we have just listened from the right hon. gentleman, shall we be given an opportunity of discussing the statement, and the circumstances in which it has arisen, and, if so, on what day ?

Mr. BONAR LAW : It is not usual, I think, for a Member of the Government to say anything in reply to a personal statement such as my right hon. friend has made, and I should not have done so except for the noble lord's intervention. Since I am on my feet, however, I desire to say, on behalf of the Government, how much we regret that our right hon. friend has found it necessary to resign, but at the same time to say that it is simply a question of difference of opinion; he takes one view and we take another.

As regards time for discussion, we shall, of course, follow the wishes of the House. I cannot name a day, but if there is a desire for such discussion we shall be very glad to afford the opportunity for it.

Mr. BILLING : May I ask whether the right hon. gentleman the Leader of the House can say if it is the policy of the Government to appoint another Air Minister ?

GENERAL SYKES' MISSION.

Major-General the Right Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., gave a farewell lunch at the House of Commons on Nov. 12th, to Major-General Sir F. H. Sykes, C.B.E., K.C.B., C.M.G., who was about to leave the country on a mission to the United States. Supporting him were the American Ambassador and Air-Marshal Sir. H. M. Trenchard, Bart., K.C.B., D.S.O.

Proposing the health of the American Ambassador, General Seely said General Sykes was about to go to America at the invitation of Viscount Grey in order to confer with the United States people in aviation matters.

The American Ambassador, in acknowledging the toast, said that he rejoiced in the fact that this mission opened up a field of work and of labour which we entered upon together, and in which our co-operation, he thought, might be taken as assured. It was a very generous thing that the British Government should be willing to transfer to the United States one of its best, the largest, and most improved airships.

General Sykes said he went to America to try to help that co-operation which they had met with in France in the air, both actively and in Paris, in connection with the Conference.

Lord Londonderry said that whatever General Seely did in the future, he would always have the affection and goodwill of those connected with the air.

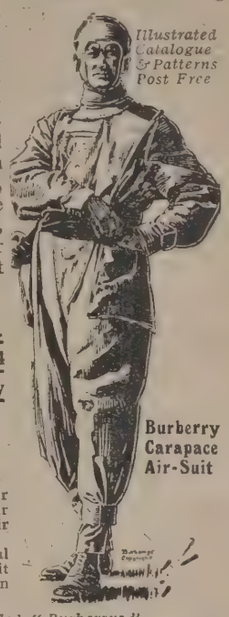
BURBERRY FLYING KIT



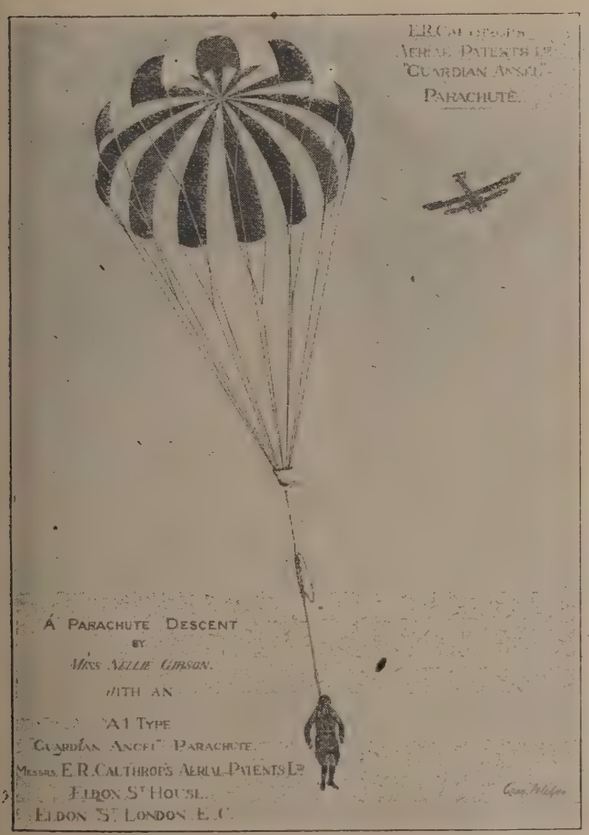
Designed by expert aviators and made in the Burberry material chosen by Sir John Alcock, D.S.C., for his flight across the Atlantic.

Lightweight, self-ventilating, and as flexible as an ordinary wool fabric, this material is as impenetrable as leather, and ensures comforting warmth at all altitudes.

Proofed by Burberry processes, it provides an effective safeguard against rain and all damp, without the aid of rubber, oiled-silk, or other air-tight agent.

Illustrated Catalogue & Patterns Post Free

Burberry Carapace Air-Suit



Complete R.A.F. Kit in 2 to 4 Days, or Ready to Wear.

The Tielocken
Doubly covers every vulnerable part of the body, and is lined throughout with lightweight fleece. Fastens with a strap-and-buckle instead of buttons.

Burberry Carapace Air-Suit
The outrig worn by Sir John Alcock and Sir Whitten Brown on their Trans-atlantic flight. A thoroughly practical one-piece overall suit that protects the airman from head to heel.

Every Burberry Garment is labelled "Burberrys."

AIR FORCE.

AIR MINISTRY, NOV. 11th.

R.A.F.—The following officers have been granted short service commns. in the ranks stated, with effect from Nov. 11th. They will retain their seny. in the substantive rank last held by them prior to the grant of the short service commn.

In the case of officers now gazetted Flying Officer from Pilot Officer, seny. will date from the date of Gazette :—

Sqdn. Leaders.—T. S. Impey (A.); J. C. M. Lowe (A.P. (T.)).

Flight Lts.—C. B. Belt, M.C., M.B.E., D.C.M. (Ad.), V. Greenwood (T.), B. D. Hobbs, D.S.O., D.S.C. (S.), H. J. Payn (A.), E. M. Pizey (A.), H. C. Todd (A.), W. D. Wain (T.), R. B. Waite, M.B.E. (S.O.), F. C. Wilkinson (A.P. (T.)), F. R. Williams (T.).

Flying Officers.—E. A. Burridge (Ad.), W. Jones (A.), W. M. Long (Ad.), D. S. C. Macaskie (T.), W. G. MacD. Nicholl (T.), E. P. Terry (T.), E. A. Tottle (T.), B. Turner (A.P. (T.)), L. A. Walters (A.).

Observer Officer.—W. J. Umpleby.

Flying Officers (from Pilot Officers).—E. F. Elliott (Ad.), V. S. Holbrook (T.), A. B. Langridge (Ad.), E. J. Newman (T.), C. H. N. Nunn (T.), T. Thomson (T.).

It is intended that officers empld. as Stores Officers or on "Q" duties shall belong to the new Stores Branch when formed. Officers appearing in this "Gazette" who are at present so empld. will be transfd. to this Branch on its formation and will accept these short service commns. on that condition. They will then come on to the rates of pay of that Branch, but will meantime be permitted to draw the higher rates laid down in the new scheme for officers on the General List. Any officer posted to the Stores Branch on its formation will then have the option of declining his short service commn.

The notifications appearing in the "Gazettes" of the dates indicated below, appointing the following officers to short service commns., are cancelled :—Flt. Lt. T. L. Williams, M.C. (Ad.), Flying Officer E. R. Bruce (A. and S.), Flying Officer A. H. Burmann (S.O.), Flying Officer J. W. Milner (A.), Flying Officer R. N. Walter (Ad.), Sept. 12th; Flt. Lt. T. K. Young (T.), Flying Officer D. B. Robertson (A.), Sept. 16th; Sqdn. Leader H. G. Atkinson, O.B.E. (T.), Flt. Lt. E. R. Pritchard (A. and S.), Flt. Lt. P. C. Purser, M.C. (A.), Flying Officer J. Burden (T.), Flying Officer E. H. Colman (A.), Flying Officer C. S. Fulton (S.O.), Flying Officer L. W. R. Grubb (A.), Oct. 24th.

The notification appearing in "Gazette" of Oct. 28th appointing Sqdn. Leader J. C. M. Lowe to a permanent commn. is cancelled.

R.A.F.—PERMANENT COMMISSIONS.—The notification in "Gazette" of Aug. 1st appointing the following officers to permanent commns. is cancelled :—Maj. E. T. Newton-Clare, D.S.O. (A.), Maj. V. A. A. Albrecht, O.B.E., M.C. (A.), Maj. F. F. Minchin, D.S.O., M.C. (A.), Capt. A. F. F. Jacob, D.S.O. (A.), Capt. G. L. Hunting (T.), Lt. R. G. St. John, D.S.C. (O.), Lt. J. H. Rutherford (T.), Lt. F. Thompson (A.), Lt. A. T. Laing (Ad.).

The notification appearing in "Gazette" of Aug. 22nd appointing Lt. J. W. D. Leigh, M.C. (A.), to a permanent commn. is cancelled.

The Christian names of Sqdn. Leader John Claude Malcolm Lowe are as now described, and not "John Cecil Mansfield" as stated in "Gazette" of Oct. 28th.

The following temp. appointment is made at the Air Ministry :—Staff Officer, 3rd Class.—(P.).—Flt. Lt. R. Addenbrooke-Prout, O.B.E., M.C., Oct. 21st.

The following temp. appointments are made :—Staff Officers, 3rd Class.—(P.).—Flt. Lt. F. B. Beauman, May 31st; (T.) Lt. J. W. Sawyer, April 11th, and to be actg. Capt. until April 30th (substituted for notification in "Gazette" of July 22nd).

FLYING BRANCH.—Sec. Lts. to be Lts. :—(Hon. Lt.) J. S. Arthur, M.C., April 15th, 1918; A. L. Wilcox, Oct. 6th, 1918.

Sec. Lt. D. H. Woodhouse (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt. (A.), July 28th, 1918.

Sec. Lt. E. Wallace (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt. (O.) (Aug. 8th, 1918) (since killed).

The following relinquish their commns. on ceasing to be empld. :—Sec. Lt. (Hon. Lt.) R. W. V. Midlane (K.R.R.C.), May 21st; Capt. W. T. F. Holland, A.F.C. (Lt., Lancers), June 5th; Lt. J. C. Preston (Lt., Bedford R.), Aug. 6th; Lt. C. L. Mundey, M.C. (Lt., R. Fus.), Oct. 6th; Sec. Lt. (Hon. Lt.) R. A. Adams (Lt., C. Ont. R.), Lt. (Hon. Capt.) F. H. Eberti (Capt., R.G.A.), Lt. R. A. Grosvenor, M.C. (Capt., Dragoon Gds.), Lt.-Col. A. T. L. Nye (Paymr.-Commdr., R.N.), Oct. 16th; Lt.-Col. T. A. E. Cairnes (Capt., Dragoon Gds.), Oct. 17th; Maj. E. H. M. O'Farrell (Maj., R. Irish Fus.), Oct. 18th; Lt. B. D. Collison-Cox (Lt., N. Staffs. R.), Oct. 21st; Lt. C. M. J. Barrington (Lt., D.L.I.), Lt. W. C. Thompson (Lt., R.G.A.), Oct. 23rd; Lt. C. T. Armitage (Lt., Lab. Corps), Sec. Lt. J. H. B. Rygate (Sec. Lt., Dragoon Gds.), Capt. R. J. G. Temple (Lt., R.G.A.), Oct. 28th; Sec. Lt. P. S. Blowey (Sec. Lt., Devon R.), Oct. 30th; Lt. A. H. W. Fleming (Lt., Norfolk R.); Sqdn. Leader (actg. Wing Commdr.) R. Hall, O.B.E. (Capt., Welsh Fus.), Nov. 1st.
